In the case of reforms, it is a question of laws in various areas (foreign currency, foreign trade, international loans, banks) with whose help it is intended to restrict economically the political decentralization and republican cliques. "Concentration" (the term "centralization" is unpopular) of foreign-currency income is to be furthered. So far 40 percent of it has been in the hands of export firms, and thus of local apparatshiks; now the entire foreign-currency income of enterprises is to be exchanged against dinars at the National Bank. The bank will then distribute the foreign currency among interested importers on the basis of all-Yugoslav export promotion criteria. At the same time it is planned to apply stricter legal criteria, and thus to eliminate the small enterprise banks subservient to local clans and cliques, in order to make possible a larger scale money and credit traffic exceeding provincial and communal limits.

De-Titoization leads to a striking loss of authority of the Tito heirs. "They are no longer pledged to any cause or international role, and all they are looking for is their own advantage, villas, apartments, cars, money, and prosperity," says the courageous civil rights activist Kosta Cavoski openly and with great bitterness. Whereas Tito's historical place of honor definitely is acknowledged--particularly his epochal, though reluctant, break with Stalin--he has become irrelevant for Yugoslavia's burning current problems, even though his portraits continue to hang on the walls of all official premises. Tito would not make it today any longer even if he were alive," says the doyen of Slovene literature, Josip Vidmar, who promoted Tito's election to marshal of Yugoslavia in November 1943.

Quite openly, Tito is being blamed for "unforgivable mistakes." Above all, his growth policy based on borrowing billions of dollars from 1976 to 1980 is being termed "economic suicide."

The mediocrity of the team of servile yes-men whom Tito surrounded himself with and who survived him as rulers is being pilloried. Tito's Stalinist past is being newly revived. Historians charge Tito's communists with having committed "mass murder" of their adversaries after they assumed power in 1945. They accuse Tito's celebrated partisans of having behaved "like vagabonds and chicken thieves." They turn the Chetnik guerrillas, whom Tito fought as "traitors," into "Serbian nationalists."

All attempts to save the marshal's honor are now in vain. A special commission for preserving and developing Titoism complains about a lack of quoting Tito's name and speeches. It is said to have opposed Tito's head being printed on the new 5,000-dinar bills in light of the fact that the value of the dinar is constantly decreasing. The Zagreb paper VJESNIK inveighs against "direct and unequivocal attacks against Tito and his closest collaborators," and trials leading to years of imprisonment are conducted against persons calling "Tito's character and works" into question. But these strongman propaganda and police actions do not seem to be of any use any longer.

Disgruntlement in the Army

And where does the Army stand in this chaos of opinions and political forces? Could it soon be the turn of the generals in Belgrade? Is there a "Yugoslav Jaruzelski" on the horizon? It does not look that way. Western observers and military experts consider a military assumption of power to be "extremely improbable." They take Defense Minister Branko Mamula by his word; he has given assurances that he commands "a people's army, not a putsch army" and "supports the political system." Yet there is growing disgruntlement among the generals about the economic crisis, nationalistic "enemy" excesses, "disintegration," and the weakness of central state and party organs. Top officers make no secret of their longing for the good old "democratic centralism," calling for "radical changes" in the party leadership and a tighter party structure.

It is striking that army spokesmen also make themselves heard on nonmilitary questions in the course of Central Committee discussions, that local militia units subordinate to the Army increasingly involve themselves as strike breakers in labor disputes, that the untoward term of "political security situation" is being used increasingly in the official jargon. Moreover, the defense minister is demanding vehemently and with new self-confidence a legal fixing of the share of the military budget in the national income. Dealing with the internal Yugoslav dangers scored by the military, the secret action plan for "preventing and eliminating emergency situations" passed by the Central Committee provides for comprehensive Army aid. As the motive force and instrument of the supporters of a hard line in the party leadership, the Army must therefore definitely be taken seriously as a factor in domestic politics.

Nevertheless, a solution of the Yugoslav crisis is not being offered by the Army either. So the fateful Yugoslav question remains: how is one to expand freedom and democracy without letting go of communist power?

The dilemma could perhaps be solved if one took seriously the lofty pronouncement of the 1958 party program which led to the second break by Tito with Moscow: "Nothing must be so sacred to us that it cannot be replaced and excelled by something even more free, progressive, humane." There are justified doubts in Yugoslavia that the future head of government, Branko Mikulic, will adhere to that.

ECONOMY YUGOSLAVIA

CONTROVERSY OVER 'PROGRAMMED INFLATION' CONTINUES

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian 15 Dec 85 pp 18-20

[Article by Marijan Korosic: "The Mistakes of Programmed Inflation"]

[Text] This fall has been a hot one. Now, in just one month, the cost of living can grow by more than 10 percent. In other countries, with which we must compare ourselves, it does not grow that much in an entire year.

Inflation has certainly contributed to the existence of many dissatisfactions, not just in our country but also elsewhere in the world. Many politicians have gotten ahead because of the inflation that occurred before them. An equal number of politicians have left the scene because of inflation. Recently Professor Cirovic introduced the concept of "targeted inflation" (in English target means goal, so now you can translate it) into our literature. Other economists, such as Professor Perisin, popularized the concept, with the same meaning, but using the more understandable expression "programmed inflation." Every period has had attempts at innovations. Can this idea be called an innovation?

Film Seen

The innovators are not quite original. They merely repeat what we have already had, which did not lead to curbing inflation. They are proceeding from the need to proclaim not only the rate of monetary growth and the rate of the nominal social product, but also a breakdown into a programmed rate of production and a programmed rate of inflation during the next period. They are also proceeding from the need for monetary targeting to enjoy a sufficient degree of confidence among most of the market transactors in the system.

For us, this would mean the establishment of a social consensus between the economic policy-makers and associated labor. "Such a verified and coordinated basis," Cirovic says, "for the adoption of the annual economic policy plans, could then be a basis for the conduct of organizations of associated labor, especially with respect to the determination of the rate of inflation for the current year." And further on: "This would have a coordinated and stimulative influence upon organizations of associated labor seeking, more quickly and actively, ways to reduce their expenses, so that they could be consistent with the programmed curbing of inflation while minimizing recession factors in the implementation of the coordination process."

Even among the initial reactions, there were not many supporters of this idea. Professor Bajt rejected the idea as an unrealistic intellectual construct. He sees the sole element of reality as being the inclusion of the "executive-political structures of the sociopolitical communities" in the social consensus mechanism. This, however, brings us to state and political direction of the agreement process, in which self-management only serves as a screen and a tool for administrative control of the economy. I agree with this assessment. Even this would be enough of a reason not to discuss the idea in academic circles. The idea is not only unrealistic, since it does not take into account even the elementary forms of the price equation, but it also contradicts the socioeconomic foundations of the Yugoslav system. In this system, the commodity nature of business activity, which includes the free action of economic subjects, is the key element.

Programmed inflation, however, found a place for itself in the Draft Resolution on Economic Policy for 1986. A 30 percent price increase is planned. All that remains now is for this inflation to be "redistributed" among the republics and provinces, and for the latter to allocate it further among the main economic subjects. The federal government will be the referee.

We have yielded to proposals that are in conflict with what has been the goal so far, i.e., the Long-Term Economic Stabilization Program. The unique features of our system also include the fact that the same government conducts two economic policies, and changes its policy even before any full implementation of the first policy has begun. Something similar happened to us in 1968. The developments after that year are enough of a basis for predicting what will happen now. Marx often quoted Hegel: history has a tendency to repeat itself, the first time as a tragedy, and the second time as a farce. We in Yugoslavia really have the feeling that history is repeating itself.

There is a definite certainty that the proposal and the already initiated introduction of programmed inflation actually do not have the curbing of inflation as the primary goal (after all, it cannot really be curbed during the foreseeable future); their goal is instead to reduce nominal interest rates, halt the depreciation of the dinar, and adopt administrative measures to oppose price increases. All of this is directed against the economic mechanism that has in fact led to an enormous redistribution of income, but not in accordance with the "outlining" of those who are in favor of the status quo (a status that is becoming a curse!), but rather in accordance with economic criteria that would be the only valid ones, or at least mostly valid.

One does not have to provide much interpretation of what price manipulation means in our country. The revival of the old proposals, which have already been present to some extent in concrete policy, will reduce Hegel's idea to history repeating itself only as a tragedy. Although it is regretable, I will not devote any more space to this, except to emphasize that administrative price control is also in conflict with the new Law on the System and the

Social Control of Prices (in effect since 1 january 1985). This is the first of only two systemic laws (the other is the Law on Planning) that the Assembly has managed to pass since the adoption of the stabilization program. Here we can see what a short time our systemic laws can last, and how difficult it is to defend them.

Abandonment of the Reform

Since the very adoption of the stabilization program, economic policy has encountered a problem that has not been assessed with complete objectivity in politics and the economy, the problem of the repayment of foreign debts. The critics of the present economic policy do not believe that the economic policy measures could have been directed toward anything other than primarily toward maintaining external liquidity, under pressure or without it. Whether some other measures could also have been adopted is another question.

Because of the debts, but even more because of the general turning of the economy toward new markets and a new method of production, exports are the key element in solving the economic problems. The fact is that exports have a 100 percent regular effect on the exchange rate of the dinar. Any vacillation in this regard is immediately paid for with a high price, and this is not just accelerated inflation. Recently there has been a quiet retreat from this vacillating although somewhat more active policy of a real exchange rate for the dinar. The conditions for the possession of foreign exchange are also being changed; in October the possession of foreign exchange was reduced from 46 percent to 42 percent.

Although we will no longer be able to maintain seriously funded economic recommendations, we will have administrative intervention, and we know that this will neither increase exports nor reduce inflation. The burden of correcting the mistakes will only be shifted completely to those who do not deserve it because of their overall economic performance, especially their export performance.

Interest is now the most sensitive part of the anti-inflation policy. The phenomenon of interest, the reasons for its being maintained, its functions and consequences, constitute a difficult problem for economic science. Interest is also linked to the institutional system of a specific economy. With a few exceptions, discussions of interest rates and their role in the self-management system are conducted in general terms, and too often reduced to issues related to technical and banking activities, or even the accounting system.

The Size of Interest

If we take interest simply as a market phenomenon, without consideration of its institutional framework, we should now recall and refresh the theories that have come from K. Viksel, through J. Schumpeter, to the present day. The idea of exploitation, which has come from Adam Smith through Karl Marx, cannot be accepted, since it can only be proven in a stationary economy. According to Schumpeter, for example, a banker is not only an intermediary in the purchasing of goods, but is also a producer of money. Consequently interest is not a compensation for savings, but is rather a payment from the production sector to the financial sector in return for the availability of money. Today we can see that Western economies are passing through a process of profound transformation and modification of the production structure, the changes in which involve mechanisms that, through what is at first glance a neutral market for money and interest, are accomplishing enormous and essentially civilizing changes within individual developed economies, as well as changes in the international division of labor that will leave lasting consequences.

But what theories is our interest policy based on? The first serious steps in using interest as an important market mechanism were taken in the planning documents for 1982, when interest was put in a more active position in order to stabilize economic trends. Since then interest rates have nominally increased sharply, but this has nevertheless not turned them into real positive interest rates. In order to evaluate interest policy, we should also take into account the fact that the actual interest rates (for old and new credits and exceptions) are far from corresponding to the prescribed interest rates (the maximum ones). For example, in 1984 the average actual active interest rate was 11.75 percent, and the passive one was 7.44 percent. Both are far from real interest rates: the former by 28.55 percent, and the latter by 33.47 percent.

One could continue to list many figures, but it is not necessary here. If we turn only toward the producers and ignore consumer interest, several fundamental relationships to which the economic system has led should be emphasized. Most of the property of the socialized sector has been financed with its own capital. That would be a very good situation if it did not conceal the following problems. In the first place, most of the property and its own sources was created through a revaluation of the funds, while capital formation from distribution has contributed relatively little to an increase in the business fund. In the second place, with a high level of investments relative to the economy's capital formation capability, only modest possibilities remained for financing working capital through savings. Investments in inventories represent an enormous and increasingly greater part of the social product. We can identify the way in which working capital is used as one of the basic causes of the deterioration in the quality of the economy. The increase in interest rates did almost nothing to reduce inventories in relative terms. This is because the Yugoslav economy does not react to demand. Prices are only adjusted with respect to costs, and so the economy is able to take any credit at any interest rate. We also have a third negative phenomenon in the financial structure. The favorable ratio of the property of the socialized sector and its business fund has been achieved while simultaneously creating losses in the Yugoslav banking system. It seems that these losses are now the primary fuel for inflation.

Systemic Rentiers

In such a situation, there has to be an increase in interest rates, first of all up to the rate of inflation, and then beyond it. This increase is a means of eliminating the negative consequences that inflation is inflicting upon the economy and the population that saves. Inflation is systematically destroying distribution according to work, and so the introduction of real interest is a socialist instrument. Interest that is below the rate of inflation is not rentier income, as some people think. The greatest rentierism occurs in the distribution of the income that arises on the basis of unreal expenses.

Inflation and interest that keeps pace with it will bring about a concentration of capital formation in some production and financial sectors, and this will lead to structural changes. If we adhere to the definition that the priorities are where the greatest economic results are expected (which can consequently also pay the highest interest), then interest makes possible a new redistribution of capital formation in accordance with economic criteria. Naturally, handicapped thought takes as the priority those areas in which capital formation is being artificially forced (on the basis of unrealistic plans or regardless of them, it is all the same), independently of economic criteria, and so will not agree with the allocation function of interest. This is why the real experts are crying so much for real interest.

The basic mistake of a theoretical-methodological nature that is made by the critics of the present economic policy is that they feel that any inflation, and thus Yugoslav inflation, is directly linked to the methods of the implementation of economic policy. This is not far from the frequently critized thesis of Milton Friedman that "inflation is always and everywhere a monetary phenomenon." A much more cautious definition should be preferred, even though inflation has become unbearable and should be reduced as soon as possible. The above assessment of economic policy by Yugoslav critics conceals mistakes that are inconsistent with a materialist concept of development.

Nevertheless, one should believe that the creators of economic policy will not yield to ideological attacks, and that, taking into account and perceiving the full complexity of economic laws and the needs (and the federal government has the capability of seeing the whole), they will obtain the strength and incentive for different and more fundamental changes in the system, and not eliminate even the little progress that has been achieved in economic policy.

The international market and the competition punish mistakes and delays. Technological stagnation, and in some opinions backwardness as well, could bring us in the foreseeable future to an even more serious and dangerous crisis than the one caused by overindebtedness and disrupted relationships in the economy. Any acceptance of the idea of programmed inflation will not reduce inflation, but only create a gap between prices and the need for capital formation in the more energetic sectors of the economy. It would intensify the extent to which we are lagging behind the rest of the world.

MACEDONIAN FOREIGN TRADE DEFICIT FOR 1985

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 4 Feb 86 p 3

[Excerpts] The economy of Macedonia, occupies sixth place after Montenegro and Kosovo in creating the Yugoslav social product and occupies seventh place after Vojvodina in regard to coverage of imports by exports last year. At the same time one should note that Croatia occupied sixth place as regards import/export coverage although it is first in creating the Yugoslav social product.

Part of the reason for Macedonia's unsatisfactory foreign trade results stems from...irrational investments such as that of "Feni". According to the latest report, the economy of this republic will have to bear about one-half a billion dollars in damages as a result [of irrational investments].

Macedonia exported $541 million worth of goods last year, or 5.2 percent of all Yugoslav exports and only 6 percent less than Macedonia's share in the Yugoslav social product, which is the same percentage that Croatia is lagging in exports compared to its share in the social product.

In regard to imports, Macedonia spent $848 million last year, or 7.1 percent of total Yugoslav imports, resulting in a deficit of $307 million and coverage of imports by exports was only 63.8 percent (only Vojvodina showed worse results).

Data on imports of energy raw materials is needed because the Skopje refinery was built for "imported oil" and on the basis of hard currency credits. This republic spent $272 million last year to import 1.01 million tons of oil and 215,000 tons of oil derivatives, which is 11 percent of the total amount of $2.484 billion spent to import energy raw materials.

Macedonia exported $351 million worth of goods to the convertible-currency market, or 64.8 percent of its total exports and 5.5 percent of Yugoslav exports to this market. It imported $497 million worth of goods from this area, or 58.6 percent of the republic's imports and 6.2 percent of total Yugoslav imports. The coverage of imports by exports was 70.6 percent and the resulting deficit of $148 million [as published] is 8.8 percent of the $1.661 billion deficit of all republics (except Slovenia) and both provinces (in which Croatia, Vojvodina and the Federation predominate) on this market.

Macedonia exported $190 million worth of goods to the clearing-account area, or 35.2 percent of its total exports and 4.7 percent of Yugoslav exports to this area. It spent $351 million on imports from this area, or 41.4 of republic exports [presumably, imports] and 9 percent of Yugoslav exports [presumably, imports] to this area. This resulting deficit of $161 million is 1/4 of the $629 million deficit Bosnia-Hercegovina, Macedonia, Slovenia, and Vojvodina have on this market. The other republics and Kosovo have a favorable balance of $760 million with this area.

PROVINCE OF VOJVODINA SHOWS POOR FOREIGN TRADE RESULTS

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 5 Feb 86 p 2

[Excerpts] The Vojvodina economy in regard to foreign trade results represents a collection of contradictory elements for which a solution...has not been found..., although it is clear that things cannot continue to this way. According to the level of economic development, Vojvodina is third in the country. According to its share in creating the Yugoslav social product it occupies fifth place, with 11.6 percent, but its share of exports in the province's social product, is only 21.7 percent.

This is frequently explained...by [Vojvodina's] unequal position regarding exports of agricultural products. Price formation, along with application of the so-called cost principle which has dominated Yugoslav agriculture for more than a decade and its introduction into the oil industry 2 years ago, is...one of the most important causes of the above results.

Last year this province exported $860 million worth of goods, or only 8.2 percent of all Yugoslav exports, and the negative difference between its share in the Yugoslav social product and its exports is 3.4 percent, or more than that of any other republic or province. Vojvodina exported only 21.9 percent of its social product, or 89 percent less than the country average and 52 percent less than that of Montenegro.

There is no doubt that preventing the export of certain agricultural and food products partly contributed to such unfavorable export results, but even without this restriction much would not have been achieved. Producer prices of these goods could not nearly compete with those on the world markets because they are formed according to the cost principle. Also, Vojvodina...meets most of its needs in electric power and coal from other [Yugoslav] regions for which ...sales abroad are also limited because this is in the interest of the country.

There is no doubt that preventing the export of certain agricultural and food products partly contributed to such unfavorable export results; but even without this restriction much would not have been achieved. Producer prices of these goods could not nearly compete with those on the world markets, because they are formed according to the cost principle. Also, Vojvodina meets most of its needs in electric power and coal from other [Yugoslav] regions for which sales abroad are also limited because this is in the interest of the country [i.e., to sell domestically].

Vojvodina imports last year amounted to $1,453 billion, or 12.2 percent of Yugoslav imports but also 36.8 percent of the province's 1984 social product; thus, its trade deficit was $593 million, or more than any other region of the country. When it is known that nearly one-half of the province's imports ($708 million worth) consist of energy raw materials, oil and oil derivatives, which are spent throughout Yugoslavia, one could conclude that this is unfavorable for Vojvodina. But this is only a first glance. Exports from the entire Yugoslav economy provide the funds for importing these raw materials. In addition, Vojvodina sells about 1.4 million tons of its oil to refineries at world prices, earning about $180 per ton, in addition ot its sale of oil derivatives at prices averaging three times more than those paid for imported raw materials.

Vojvodina exported $511 million worth of goods last year to the convertible-currency market, and imported $776 million worth, or 53.4 percent of its total imports.

It exported only $349 million worth of goods to the clearing-account area but imported $677 million worth of goods from this area last year.

/8918
CSO: 2800/175

ECONOMY YUGOSLAVIA

BRIEFS

BOSNIA-HERCEGOVINA FOREIGN TRADE--In 1985 Bosnia-Hercegovina exported $1.469 billion worth of goods, or 14.1 percent of all Yugoslav exports and 7 percent more than the share of this republic's economy in creating the Yugoslav social product. At the same time this republic imported $1.601 billion worth of goods, or 13.5 percent of total Yugoslav imports and 1 percent more than this republic's share in the Yugoslav social product. Bosnia-Hercegovina received from the Federation $529 million in hard currency to import goods last year; this amounted to 33 percent of its imports. For this amount it imported 2.832 million tons of coking coal, 1.4 million tons of oil, and 155,000 tons of oil derivatives. As has been characteristic for this republic for several years, it bought and sold more on the convertible market than on the clearing-account market. It sold $885 million on the convertible market, or three-fifths of all exports from this republic but 15 percent less than the average countrywide exports [to this market]. At the same time it imported $912 million worth of goods from this area, including, as noted, $529 million worth of energy raw materials. Bosnia-Hercegovina exported $584 million worth of goods to the clearing-account area, or two-fifths of all exports of this republic and 14.5 percent of Yugoslav exports to this area, but it imported $689 million worth of goods. RELATIONSHIP BETWEEN CEAUSESCU, MILITARY DISCUSSED

New Role of Army Examined

Frankfurt/Main FRANKFURTER RUNDSCHAU in German 7 Jan 86 p 3

/Article by Harry Schleicher: "Romanian Army Caught in Crossfire"/

/Text/ The energy crisis, supply shortages, overall winter doldrums--they have all become part of everyday life in Romania, just like ambitious plans. And just as much in keeping with tradition the New Year was rung in with announcement of great economic goals. The 1st year of the new 1986-1990 5-year plan alone is supposed to achieve economic results equal to the entire preceding 5-year plan. GNP is supposed to rise by 10 percent and overall production even by 12 percent.

But whatever the plan or the propaganda may say--among the population dissatisfaction and skepticism regarding the glorious statistics which hardly have any bearing on everyday life are growing. It also seems as though dissent and criticism of state and party chief Nicolae Ceausescu's economic policies is stirring. That at least is the conclusion to be reached from public statements he himself has recently made.

Not too long ago, in speaking before the RCP Central Committee, Ceausescu complained about the fact "that some party functionaries bearing great responsibility have not been making enough to an effort to implement agreed upon programs and plans...At times, I have the impression that some functionaries believe that they can afford to ignore decisions and the law of the land when they have been given a job to do."

In particular, the state and party chief addressed words of warning to representatives of the highest party and government bodies, i.e., the Central Committee, the Political Executive Committee and members of the cabinet, saying that he will not countenance "a single deviation from the law of the land and the decisions of the party." He concluded his philippic by saying: "We are not a debating society; we are and must remain a revolutionary party..."

There is no other country in Eastern Europe which permits as little information to become public as Romania when it comes to events inside the power centers. One of the reasons for this is that power itself is increasingly concentrated at the top of the pyramid--with Nicolae Ceausescu sitting unchallenged at its apex. The style of political rule which has become a hallmark of this system makes it extremely difficult to obtain any information on deviation and much less opposition in anything like real terms.

Still, Ceausescu's criticism of the leadership cadres and his vehement rejection of any structural reform ideas (e.g., granting more influence to the private sector as in Hungary or China) are clear evidence of the fact that reform ideas are in fact being debated below the surface. Apparently there are some responsible people secretly asking whether the severely imbalanced economy might not be put back on its feet through the introduction of such alternative programs. In the meantime, however, Ceausescu himself is continuing to harden is position as the most dogmatic proponent of antireform policies.

One concrete example of this is Ceausescu's order to use the army to resolve the energy emergency which has hit the country during each of the past three winters. This action recalls the policies of early Leninist war communism, i.e., the very opposite of a reform policy such as the one subsequently introduced by Lenin.

But there are other events which have turned the spotlight on the army as a major factor in Romanian domestic policy. During the 20 years that Ceausescu has been in power one has gotten used to the personnel merry-go-round turning faster and more often all the time. Just the same, the way the changing of the guard at the head of the Defense Ministry occurred was a bit surprising. Defense Minister Constantin Olteanu had just returned from a visit to Moscow when Ceausescu introduced Vasile Milea as his successor at a plenary meeting of the command and party directorate of the Romanian Army.

Milea's grand entrance in the presence of his commander-in-chief, Ceausescu, topped all previous records of obeisance and servility. "We ask you to permit us to attest to our great respect and esetem for you, the most illustrious son of the Romanian people, the hero of heroes of the people, the brilliant director of the destiny of our country, an outstanding personage of the present-day world, whose name is an expression of the glorious era inaugurated at the historic Ninth Party Congress (in 1965 when Ceausescu became chairman of the RCP, Ed.), a name which has inscribed itself into the consciousness of mankind as a symbol progress, freedom and peace."

Does this type of byzantine language merely represent an aggravated continuation of existing leadership styles or is it a reflection of an actual political process behind the scenes? Although former Defense Minister Olteano was appointed to the rather influential post of party secretary for Bucharest, Ceausescu's criticism of the army leadership was hard to overlook.

Two particular subject areas were the subject of special criticism: the role played by the army in economic life and its unsatisfactory collaboration with the security units (police and secret police) under the Interior Ministry and the patriotic Youth Guards. Ceausescu criticized the officers for "doing somewhat less today on behalf of the general development activity of our country than was done during the first years of building socialism."

As a consequence, the army has been assigned five additional economic tasks during the new planning year. It is to make a major contribution to the construction of a canal from the Danube to Bucharest which is turning the capital into a major European inland port. The army has also been ordered to help in the establishment of a 1.5 million hectare irrigation system and a reforestation program. There is good reason to doubt that such use of the army as unpaid labor will meet with general approval. Ceausescu himself indicated that the action was being criticized within the army itself--resumably among the officers who consider such work beneath their dignity.

The second major criticism which culiminated in Ceausescu's calling on the army to play a greater role in the state and in society reads like an admission that something like an independent, particularist trend actually exists inside the Romanian Armed Forces. This might explain why Ceausescu expressly called for closer collaboration between the army and the units of the Interior Ministry and for improved political training for officers "with the revolutionary communist spirit."

One sometimes hears it said that the army cadres are dissatisfied with their material status as compared to the Interior Ministry's security units. Although there is no proof of this, one may assume that Ceausescu is trying to counteract the dissatisfaction heightened by the economic problems by ordering the army to collaborate with (or rather submit to) the security forces over which he has more control. Romanian domestic policy which seemed to be going nowhere for such a long time appears to have started moving once again.

Opposition to Ceausescu Alleged

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 27 Dec 85 p 5

/Article by "V.M.": "Resistance in Romanian Army"/

/Text/ Vienna, 26 December--In a speech to officers on 17 December, the full text of which has now become available, Romanian head of state and party chief Ceausescu has confirmed that there are signs of resistance inside the army in opposition to his policies and that the recent change at the top of the Defense Ministry is a consequence of this dissent. Ceausescu's speech also indicates that the major reason for dissatisfaction among the officers is that the "leader" is making increased efforts to commit the army to the solution of purely economic problems, in particular in construction work. Ceausescu appears to feel that he has no other recouse in view of the economic difficulties; but he also seems to think that this action affords him the only opooportunity to carry out new and ambitious projects which rest on rather weak economic foundations.

Ceausescu's polemical statements indicate that the officers and men of the Romanian Army appear to think that it is their job to defend their country and that they should not be doing construction work like prison inmates. At the very start of his speech to the assembled high-ranking officers and political commissars in the presence of his wife Elena Ceausescu said that the point was to create "better conditions for the realization of the new 5-year plan" and the party decisions." Within this context," he said, it had become necessary to make "some changes" within the army. He then announced the replacement of Colonel General Oletanu by Colonel General Milea as defense ministers. Olteanu has since reappeared as party secretary and mayor of Bucharest--a responsible job but one which also involves a lot of headaches. For that matter, the incumbent is in constant danger of being made a scapegoat by Ceausescu for supply problems and other shortcomings.

Ceausescu went on to say that he wished to be "very clear" about the need for the army to participate in building the economy. This contribution, he said, was an "indispensable part" of the army's combat and defense role. He also wanted to "make it clear" to the officers that he felt there was a need to look for better ways of cooperation by the officers themselves and their cadres in the development projects of the nation. At the same time, Ceausescu referred darkly to "military cadres" which had been assigned to various economic activities and which would return to army ranks only if they were needed, i.e. in case of a national emergency. It is not clear whether Ceausescu was alluding to punitive transfers or simply to reassignments--as in the case of the recent decision to "militarize" the power plants.

Ceausescu also announced what jobs he needed the army for. The army had previously been assigned to work on two projects of doubtful economic value, e.g. the Bucharest subway and the Danube-Black Sea Canal. As part of the new 5-year plan which starts in early 1986 Ceausescu proposes to build a new canal, this time from the Danube to Buachrest. He also wants the army to carry out major irrigation projects in connection with the construction of the canal and to perform reforestation work in other areas. Observers are not sure whether Ceausescu now means to militarize the economy or to "economize" the military.

In all likelihood, this question will continue to be debated. In this context it would therefore seem to be worth noting that Defense Minister Olteanu who was obviously on his way out was given such a splendid reception in Moscow. In his speech to the officers, Ceausescu devoted surprisingly little time to the question of cooperation with the Warsaw Pact. By the same token, he sent his new foreign minister, Vaduva, to Moscow--perhaps, as some observers believe, in order to inform the Soviets about the visit by U.S. Secretary of State George Shultz. In a joint statement with Bulgarian party chief Zhivkov, Ceausescu made an additional concession to Moscow. Apparently on the basis of a Romanian initiative, the statement includes a proposal to turn the Balkans not only into a nuclear-free zone but also into a zone free of chemical weapons. The Bucharest party organ SCINTEIA is calling this proposal an expression of utmost wisdom and responsibility.

MILITARY YUGOSLAVIA

COMMANDER OF LJUBLJANA MILITARY DISTRICT INTERVIEWED

Ljubljana MLADINA in Slovene 20 Dec 85 pp 10-13

[Interview with Svetozar Visnjic, Ljubljana Military District Commander, by Miha Kovac and Uros Mahkovec: "We Have No Specific Interests of Our Own"; date and place not given]

[Text] Lieutenant Colonel General Svetozar Visnjic has assumed the duties of commander of the Ljubljana Military District (LMD) not long ago. He was born in Slavonia, and he has followed the military vocation for 42 years.

The interview with him took place during the preparations for celebrating the YPA [Yugoslav People's Army] Day. In the interview, we did not want to merely fulfill a courtesy or protocol duty. Since the armed forces are an important part of the social production process and our reality in general, we feel that one of the fundamental duties of the news media, including Mladina, is to acquaint the public with the various points of view, including the thoughts and positions of the members of the armed forces, and thus contribute to the formation of the public opinion and the further socialization of defense affairs and defense problems.

[Question] In reporting and writing on the YPA and the armed forces one fairly rarely comes across those minor matters and duties that usually constitute the major portion of each and every working day. We are therefore interested in some totally small and seemingly unimportant things of interest from the working day of a YPA commanding officer!

[Answer] With your permission, I would like to expand that question and say something about certain principles and postulates which form the basis for human relations in the YPA and about how we view the state of those relations, since that is one of the main and most important questions for the strengthening of unity. One of the fundamental values of moral and political unity, and combat readiness and strength of the YPA are its personnel and its internal relations. The army is socialist and revolutionary in its nature, it developed out of the People's Liberation Struggle, and it is the armed force of all the nationalities and national minorities of Yugoslavia. Life and work in the army are based on relations stemming from the nature and character of our self-managing socialist society because we are the army of this society which is socialist and revolutionary. The social position of of the individual in society and the human relations in the army change and grow in accordance with the development and democratization of social relations; at the same time, the role of the individual is constantly becoming stronger, the factor of awareness grows as do the factors of volition and motivation, all of which has an influence on the building of relations in the army. Human relations in the army are based on the principles of subordination and the chain of command. Within these limits (subordination and the chain of command), respect for the individual and the development of socialist humanism in the full sense of the word find their greatest expression. We must be aware of the fact that the army is part of that society, that it is not an organism outside of social trends and social relationships. Consequently, all the problems, deformations, and contradictions that appear in the society during its development will manifest themselves in the awareness, behavior, and mood of the military component and of each individual, in their approach to duty, tasks, and everyday obligations. We are proceeding from a firm ideological commitment based on the LC [League of Communists] platform and on each senior officer's ability to lead a unit and the people with knowledge, ability, skill, and personal example and not only with the formal position and authority given to him by his position in the organization. These are the main principles and demands placed on every senior officer in the YPA. Such senior officers are not developed and formed by themselves. This is a continuing process and an organized educational-training, but primarily ideological and political task that is begun in the military schools and continued without interruption throughout the time spent serving in the YPA. In our view, the military schools play the most important role in this, because they must form, during the process of schooling and educating, the basis of such conduct; also, all the other factors and personnel in the military organization are also important, because a person must, by using the knowledge and experience acquired in school, continue to improve himself. Of course, school cannot provide all that is necessary for one to discharge all the duties he comes across in the YPA; instead, these skills must be developed and improved through the performance of duty. These then are some of the postulates on which human relations in the army are based. We in the LMD feel that human relations and respect for the individual are on the whole very stable. There are no serious or acute problems that would indicate that there is no respect for the individual, that it is not possible for every individual to express himself, or that the principles of subordination and chain of command are being abused. In our army collective work is developed, very well developed, as are the collective evaluation of the situation and the collective discussion of problems, from leading to covering the rear, and all other factors.

Each senior officer in the army has the opportunity to present his proposals and views in accordance with the scope of the duties he is performing; we then evaluate them at collegium level (collegia are formed at all levels of command), and decide on the wisest course of action in a given situation. In the process of formulating decisions that pertain to command, it is easy for every senior officer to present his views, and disagree, disagree in a well-reasoned manner, with another view; the collective evaluates all this. The chain of command, however, manifests itself in having the commander in question make his decision on the basis of such discussions; afterwards, no one has the right to question the decision. When that is done, everybody must perform his part of the tasks stemming from such a decision, and implement what has been agreed upon. This pertains to leadership and command; regarding the management of human and other relations at the unit level, we have developed in each unit designated and organized personnel groups. They are the military collectives, LC and Alliance of Socialist Youth of Slovenia [ASYS] organizations, committees for order and discipline, committees for cultural and recreational activities, and committees for the security and protection of the units. There are various opportunities for the collectives and their bodies, and thus for the soldiers themselves, to discuss all aspects of human relations and suggest to the senior officers and collectives what should be done to expand and improve these relations, and so on. In this sense, each soldier affirms himself as a person and not an object manipulated by the decisions. Thus, he is a person that participates in decision making. In other words, we feel that is the only basis for reaching the best and most suitable decisions, and that afterwards such decisions are quite useful for developing a unit's combat readiness and strengthening its internal cohesion. It is understandable, however, that there still are certain problems. God has not, so to speak, made all men such that they would automatically accept all this. We try, however, to remove all these weaknesses and to harmonize these relations with the meaning of the army through organized educational work, collective work, work of youth organizations, the development of a high ideological awareness, political work, etc., and thus to strengthen, develop, and enhance them.

[Question] It is a generally known fact that the tremendous technological progress, both abroad and here in Yugoslavia, has had a very powerful influence on the development of contemporary military technology and strategy. The YPA as well has recently introduced certain new organizational things into its makeup. We are primarily interested, for example, in the experiences to date in the introduction of professional soldiers (contract soldiers), and in the experiences and analyses of the voluntary training of women.

[Answer] We do not yet have any experiences regarding the introduction of contract soldiers. This is a new thing that was introduced with the law on military service, which was voted upon in the Federal Assembly only recently. As you yourselves noted, we are introducing this category of soldier because very demanding technological equipment, demanding weapons systems, demanding communications systems, and other demanding technical systems are being introduced into the army, all of which requires a greater professionalism and comparable experience. For that reason we have introduced the category of contract soldiers. This applies to soldiers who, after completing their military obligation and after becoming trained for various tasks, would continue on a contract basis. We would thus ensure effective use of these technically and electronically demanding systems, on which these soldiers were trained, and make it possible for these systems to easily perform in armed combat in a manner consonant with their technical capabilities. After the law is adopted, it will be necessary to adopt a whole series of ancillary acts and systemic solutions that will specify who these soldiers are, for how long a time we would accept them, under what financial terms, where would they be housed, and what rights would they have. Only then will we know what the response is, and what the specific circumstances and problems with contract soldiers are.

Regarding the training of women, we have concluded a three-year trial period. During this trial period, we tested the possibilities for the military training of women for armed combat. The training took place in special women's units. We in the LMD have tested such service and training in communications systems and quartermaster service. The main feature of the system was that women volunteered for such training in accordance with certain criteria. The three-year period has shown that it would be difficult for the volunteer system to meet the needs, because the response was not sufficient and we could not use this system to ensure that the entire female population is trained for certain combat tasks. As far as relating to and commanding these women are concerned, I can certainly say that their approach to training was exceptionally serious and conscientious, and that they achieved good results in the technical areas. This trial period has also demonstrated that it is necessary to make appropriate changes and additions in the system of training in order to essentially ensure the constitutional right of all women to participate in the defense of the country and to train for that. There have been a great many discussions on how to go on with the system of training, both here at the level of the LMD command, in the republic secretariat for territorial defense, in other social bodies, and at the federation level. The Yugoslav presidency has been informed of the entire problem, regarding which there have been proposals, but the final decisions have not yet been made. The essence of the future decisions, however, will be that training should take place on a substantially broader basis than in the past, that most of the training should take place in the socio-political communities, in schools, in work organizations, and everywhere where women live and work. For certain special services, and especially for senior reserve officers, the training will probably have to take place in the YPA and Territorial Defense military schools and training centers or else in the YPA units. We expect that is will be possible to answer all these questions in the summer of 1986. We will then, in accordance with the decisions that have been reached, approach the organizational, financial, and personnel preparations, in order to implement this in a systematic manner. This is all I can tell you about this matter.

[Question] The stabilization of the economic situation is the priority of the moment. We are interested, for instance, in what specific ways is the LMD involved in these efforts and mainly in how its incessant demands for more and more complex military technology and equipment are being harmonized with the current financial situation?

[Answer] You see, the adoption of the long-term economic stabilization plan and the decisions from the 11th session of the LCY [League of Communists of Yugoslavia] Central Committee on the implementation of that plan have placed us, YPA members, under an obligation to incessantly initiate, encourage, and evaluate activities related to the plans for spending, to economize and rationalize, and to have the YPA act in the spirit of those postulates more and more, as much as possible. We are approaching these instructions in a planned and organized manner with the active participation of all personnel, from the soldiers' collectives and the LCY and ASYS organizations to the command authorities, which have the most responsibility in this regard for organizing and adopting suitable organizational measures. The results achieved by the LMD members every year confirm that stabilization conduct has indeed become our style of work and an integral part of the performance of all of our duties. We feel that the greatest contribution to stabilization is to have every dinar that is spent reflected in greater effectiveness and overall combat readiness and preparedness of the units and individuals. Furthermore, the effects of stabilization in the LMD manifest themselves in certain other areas. This is true primarily in the areas of saving energy, cooperation with the population, assistance to the socio-political organizations and socio-political communities, in work done on our own projects, and in our efforts in food production and other types of production that we are trying to develop. In all these areas there are specific indicators of economizing and of concrete results that have been achieved. Let me cite a few things in support of this: in cooperating with the society, so to speak, with the socio-political communities, the opstinas, and others, we have in 1985 built 8 kilometers of roads and repaired approximately 23 kilometers, built approximately 13 kilometers of aqueducts and dug approximately 15 irrigation ditches; members of our units have dug approximately 60 kilometers of trenches for the Post, Telephone, and Telegraph [PTT] telephone cables. In this regard, we feel that the most important task, done in cooperation with the PTT and other work organizations, was finishing the central coaxial cable which, as you know, in Slovenia runs in two main directions. In nine months of this year the members of the LMD have spent a number of work days assisting the socio-political organizations and socio-political communities. Our orientation toward our own projects, such as repairing housing and various service installations such as laundries, cleaners, and service stations is also very significant. We estimate that this construction was approximately 45 percent less expensive than it would have been had it been done by work organizations. Our efforts in food production are truly an important item in saving dinars. In only nine months of this year we have produced approximately 230 tons of meat, approximately 116 tons of vegetables, and approximately 200 tons of grain, and we have prepared the wood necessary to heat our units. We have prepared most of the hay for our livestock, lest we would have to buy it. There are a number of other indicators which point out that we have achieved important results in this area. In addition, we are also developing and cultivating certain other activities and we are concerned with new procedures for maintaining and modernizing technical equipment. We have extended the useful life of batteries, which were in critical supply on the market, discovered a way to better maintain tires on vehicles, we have implemented a number of new procedures for storing weapons and taking them out of storage and thus accelerated this process and at the same time ensured greater stability of weapons and stored equipment, etc. We estimate that this year all the activities and savings that we will implement in the LMD will amount to around 7 or 8 percent of the entire amount allocated to us for the year.

Along with all this, I especially wish to emphasize that all these stabilization efforts have had no effect on the quality of training. We are employing the soldiers in these tasks only and exclusively after they have completed their training. As you know, the length of training in the YPA varies, and it lasts at most 5 months and 22 days. During that time, the soldier acquires the basic knowledge necessary for combat. Only after that is he assigned to a unit for maintenance, prevention, etc. We draw from this contingent to ensure the minimum number of troops necessary to perform these tasks, and they are mainly agronomists, veterinarians, and various experts.

In addition, certain civilians are regularly employed in these areas, such as veterinarians, agronomists, and tractor drivers. Large numbers of troops are used only on special occasions, such as when the harvest needs to be put away or gathered;at those times we involve large number of troops, and our activities of that type are done in addition to other things and have no direct influence on the training and combat readiness of the units; still, it is important because it contributes to decreasing the overall cost of living and doing business in the YPA. In all of this, we are directly striving to have the society allocate as little money as possible for the armed forces. These then are some of the results we have achieved in the area of savings and doing business economically.

[Question] Because of the YPA's specific social position, the relationship between it and the news media is more and more complex. Military and defense interests dictate a system of military secrets, while on the other hand the responsibility of the news media for continuing to develop the socialization of All People's Defense is quite great. We are interested in your opinion on how it is possible to harmonize these, at times seemingly opposite interests. Within this context, we would like to pose some additional questions. Abroad and in Yugoslavia peace movements are acquiring more and more public attention and influence. How do you think it would be possible, in the relations between the army and these movements, to bridge these two apparently totally unbridgeable sides?

The initiative for a so-called "agreement of conscience" has been around for some time also in the OZN area of activity. What is your position on the possibility of doing military service in such a designated civilian service?

Lastly, we would like to ask you quite specifically what steps the LMD command is taking to correct the well-known fact that the number of the members of the Slovene nationality going into active YPA service is small.

[Answer] With your permission, I would like to spend some time on this question. According to our views, informing the public about the armed forces is an integral part of real socio-informational activities. As much as we are apt to talk specifically about information on the work and activities of the armed forces, we are doing this in order to emphasize the reporting in accordance with the specific defense interests of the state. The importance and purpose of reporting on the Yugoslav armed forces stem from constitutional stipulations and the social significance of the armed forces as an important social activity. When the news media report on this aspect of social activity, they must do it very responsibly and in a manner that will help to create and strengthen an ideological and action-oriented public opinion which is consonant with the concept of All People's Defense and which will help in strengthening our overall defense and protection system. In this regard, the news media are not isolated, they are part of the society's system. In this regard, all the principles and guidelines pertaining to reporting on the armed forces are valid, just as is the case with other segments of our society. The only stumbling block to reporting is the institution of military secrets, which quite frequently causes certain errors and misunderstandings. The institution of military secrets has been established and specified by law, and is respected to the extent that it affects the security of the state. We are thorough in searching for the best ways to reduce its scope and to bring it into the most restricted framework possible.

In our past dealings with the news media in Slovenia in regard to informing the public of the activities and work of the LMD members we have had no substantive complaints. Of course, I am referring to planned and organized reporting, which is when the journalist knows what he is writing about and why he is doing it, and he approaches it in accordance with the usual reasons for reporting. When they are understood to be necessary, military secrets are usually not an obstacle to objective and complete reporting and usually they do not prevent the process of the socialization of defense and protection activities. Our barracks are always open to any well-meaning journalist, and we are willing to talk and explain things. We are convinced that in this regard our army is the most open in the world. This openness comes about naturally, and it stems from the army's popular and class nature, from its social essence that was developed during the National Liberation Struggle, from all the nationalities and national minorities and, considering the specific circumstances of people under arms, it represents the socialization of the army. In this context, we are part of the armed people.

When, in noting the social role of our armed forces, one for whatever reason, forgets the essence of their social being, then one can indeed equate the role of the armed forces in our society with the social role of the armies in bourgeois societies. The roles are not at all the same, and this fact must always be present in all the news media, otherwise we would view the armed forces as an independent center of social power, struggling for its own specific interests. We, on the other hand, have no specific interests of our own. Such views and misunderstandings have also resulted in certain articles with no substance, published specifically in your jounal, Mladina. These articles supported certain groups and individuals advocating a revision of the military service. In our view, this could easily have a negative influence on young people, who could adopt such an attitude toward the army and its constitutional role. What these authors have claimed to be the principles guiding men under arms has no foundation either in Marxist theory or in the current world situation. At a time of exacerbated economic difficulties and a certain closing off of republic and province boundaries, the YPA is more and more frequently becoming the target of various nationalist, anti-socialist and antiself-management forces. These forces are especially bothered by the YPA's all-Yugoslav nature, the fact that it nurtures and broadens brotherhood and unity and an all-Yugoslav socialist patriotism. They are attacking it primarily because the YPA, by its nature, is one of the cohestive and stabilizing factors in Yugoslav society. Since their goal is to break up the society, they msut first break up those elements that have a cohesive influence on the stability and the all-Yugoslav nature of the society. In our view it is not strange that there are such divisive views among individuals and groups, because this is natural and not against the law. We must become concerned, however, when these elements are given expression in our socialist news media. In this regard, the social bodies and organs in the newsrooms and editorial offices must take greater responsibility, because they, like us, have dedicated socialist people, who are struggling for our self-managing society. I think that tendentious and sensationalist articles with no substance, which appear here and there, do not contribute to keeping the working people and members informed about the armed forces in an objective and timely manner, nor to the strengthening of their combat readiness. It is as if some people cannot understand why the YPA opposes various divisions, manifestations of disintegration, and narrow interests. Those people seek scandals, overgeneralize the basis of specifics, reprint articles from foreign journals, and assist those forces that would like to question all the values of our revolution and that dream of having the society, in both domestic and foreign policies, go in a different direction.

Of course, we feel that an appropriate critical approach is part of objective reporting on the army. We ourselves are struggling against various embellishments and attempts to gloss things over. We must, however, endeavor for objective criticism which improves things, instead of degenerating into criticism for its own sake an the worst kind of opportunism. These are some our our principles and views regarding reporting on the armed forces.

Regarding the contribution of the peace movement and our attitude toward it, I personally feel that Yugoslavia's nonaligned and peaceful policy, and its principles, including the concept of All People's Defense and social self-protection and, within that concept, the armed forces as one way to arm the people, are the best contribution to a peace movement. We must not oversimplify and compare and equate the goals of the peace movement in Yugoslavia with those of some movements in certain capitalist and bureaucratic countries. Since our country is nonaligned, all of its policies are oriented toward peace, against interference and bloc divisions, against all types of crises, etc. Within the framework of such Yugoslav policies, it is easy for each individual to contribute to the strengthening of those policies and forces that are struggling for peace. It follows that certain separate peace movements that are outside the SAWPY and LC platforms probably differ from our overall Yugoslav policy.

I also wish that the news media would report, in a reasoned and well-meaning manner, on the real and comprehensive results achieved by our defense and protection system and armed forces, and on their endeavors for peace. They discourage aggression and give security to the state. We feel that almost all the news media perform this role correctly. As you can see, there are no opposite interests or unbridgeable shores, and we must not permit the incorrect understanding of individuals and groups to obscure the fundamental policy and basic traditions and goals of the revolution. In our opinion, we must all continue to endeavor and struggle together to have what is said publicly reflect, in a truthful and honest manner, the efforts and conditions of the society as a whole and of the armed forces in a manner that would affirm the positive and defeat the negative; what is said publicly must rise to meet the requirements of the moment and be ideologically consonant with the LCY course and the policies of Comrade Tito.

Regarding an answer to the question of military service in what is popularly called civilian organization, the question demonstrates a certain basic misunderstanding. In the YPA, the soldier is trained for combat. He cannot be trained for that by serving as a firefighter or in some other organization. Combat is conducted according to certain principles, with certain means, against an estimated enemy, and in specific places; all of which has it own characteristics. If we view matters in this way, I cannot see which organizations could train a soldier for combat in one year, or where these organizations are. Such training is the reason for entry into the YPA.

We feel that an equal national representation among the senior officers in the army is an exceptionally important ideological and political question, since the YPA is the army of all the nationalities and national minorities. If the nationalities are not appropriately represented in it, it fails in a fundamental aspect. It is a well known fact that that number of young men from Slovenia applying to the military academies and schools is never large enough. I can tell you readily that the response is insufficient and that the percentage of YPA senior officers of Slovene nationality is not commensurate with percentage of Slovenes in Yugoslavia. We think that this is wrong.

The LMD command has, in cooperation with the coordination committee for encouraging the youth to enter the military and defense professions, and with other republic organs and organizations, initiated a number of specific actions to improve the situation. With these actions, we wish to acquaint the young with the profession of the military officer, and to present that profession to them as well as possible, with all its good and bad aspects. To that end, technical assemblies have been organized in all the barracks and garrisons to be visited by high school and elementary school students, and topics are being prepared to be presented during days dedicated to presenting information on defense. In addition, groups of young Slovene officers (as well as others, of course) have been organized, to visit schools and inform the students about the military profession. We have at our disposal suitable films, which are a good aid in this kind of work. We are encouraging the news media to cover topics that describe as objectively and completely as possible the various military occupational specialties and thus present the military profession to the young people and other citizens. There have also been certain television programs devoted to the scientific and research work in the army, and we fell that there have been especially effective presentations during the parade and during certain technical meeting that we had organized.

We feel that the news media, primarily those aimed at the young, and above all your journal, should contribute to the presentation of a more complete picture of the position of a military officer; not only of the position, but of everything that is necessary to induce more Slovene youths to apply to the military schools.

[Question] The young account for most of the YPA's makeup. For that reason, their organizational links are probably even more important, as is their cooperation with the area in which they are serving their military duty.

It is also known that in the past some leaders of the republic youth organization and the LMD command have held differing views on certain issues and concepts pertaining to the All People's Defense concept. We are interested in how you view current cooperation, both with ASYS republic conference and with the ASYS opstina conferences.

[Answer] I think that these misunderstandings involved some of the leaders... that this question really was not formulated in the best possible manner. Members of the LMD were not involved in a dispute with the leadership of the ASYS republic committee. We did not agree with some evaluations and positions and also with some individual leaders from the ASYS republic committee, because those evaluations and positions were at variance with the LC's programmatic orientations when they questioned the feasibility of All People's Defense concept in social communities and also certain other issues that I have already mentioned. Here I must reiterate the following: in the future, we will no longer disagree with such positions, regardless of who presents them, a youth organization or some other group. It is also known that the republic committee of the SAWPY and the central committee of the LC of Slovenia have condemned the above positions and evaluations as unacceptable or at least utopian. The fact is that relations between the LMD members and Slovene youth at all levels have been developing successfully for a number of years. This is especially true at the opstina level, at the level of high schools and elementary schools and among youth organized at the level of work organizations.

In our view, right now there are no problems that could burden these relations and render them more difficult. As far as the LMD members are concerned, in the future we will take various initiatives and give encouragement to further develop this cooperation. We feel that this is exceptionally important, since we are all working together to enhance our country's defense capability.

BRIEFS

SWEDISH RADAR SETS ORDERED--Ericsson Radio Systems AB has received an order worth 250 million kroner from Yugoslavia. Ericsson has already started to deliver the radar equipment. The firm received the order already a year and a half ago, but at that time promised Yugoslavia not to reveal anything regarding the deal. Radio Sormland [private local station] learned about it when Ericsson was testing the equipment on a Yugoslav military vehicle at the P 101 base in Strangnas. The radar sets are not classed as war materiel. They are to be used by the national police and Coast Guard. [Text] [Stockholm DAGENS NYHETER in Swedish 22 Feb 86 p 10] /12913

POLITICS INTERNATIONAL AFFAIRS

SLOVENES DISCUSS ALBANIA'S RELATIONS WITH BLOC, WEST

Ljubljana TELEKS in Slovene 28 Nov 85 pp 28-29

[Article by Janez Stanic: "Albania and Its Wooers: Tirana's Remains Firmly Closed to Moscow while Its Door Opens Somewhat in Other Directions"]

[Text] 29 November is the most important Albanian state holiday--it is liberation day. This year's jubilee 40th anniversary celebration was the first without Enver Hoxha who, for a full four decades, had led this country and left his own unique imprint of extraordinary ideological and political exclusivity and, when measured by our contemporary, and especially European, yardstick, truly unusual reclusion and suspicion regarding the outside world and everything foreign. It is therefore completely understandable that after Enver Hoxha's death--he died in the spring of this year--foreign countries have monitored rather carefully the internal situation and events in Albania and also its foreign policy, because everybody is strongly convinced that one should expect numerous changes in Albania's policy, even though it is not necessarily so or even likely that such changes will be quick and dramatic. Nonetheless, Hoxha's policies of total reclusion, isolation, and ideological and political extremism have encouraged internal resistance and conflicts even while he was still alive, and it is certain that these policies have led Albania into a blind alley as far as economic and social development is concerned.

The state holiday is also a formally convenient excuse for the Albanian leadership to tell the people at home and abroad something about its views and goals, including those pertaining to foreign policy, and to drop a hint, make an offer, or make its interests known in the context of appropriate commentaries or obligatory polite congratulations on the part of other statesmen. This has been going on with Albania for several years now, especially since the dispute with China in the late 1970's. Eastern Europe, headed by the Soviet Union has more than anyone else made it a mandatory practice to publish, year after year, suitable articles and editorials on the eve of 29 November, without criticizing Albanian policy at all, and only taking note of the former times of friendship and cooperation between Albania and the other members of the "socialist community"; this--it is dutifully emphasized--was useful to both sides, especially Albania. These seasonal recollections of the "golden times" are always followed by offers for a new normalization of relations.

Yearly Soviet Offers

Each year, the Soviet Union has been most persistent and consistent in these endeavors, which is completely understandable because the Soviet Union is also strategically and politically most interested in returning to the fold a lost sheep that was at one time a faithful member of the Warsaw Pact and the Council for Mutual Economic Assistance (CMEA). Ever since Albania's dispute with China, it has been completely clear that Soviet political analysts feel that Albania will not be able to indefinitely maintain its almost total reclusion and isolation and that it is a matter of time when it will be forced to begin to open up. With Hoxha's death, one of the most important preconditions for the possibility of changing Albania's policy came about, and one could be certain that the Soviet Union would attempt to take advantage of the new situation.

This came to pass. In the few months since Hoxha's death, Moscow has more than once offered Albania a normalization of relations, and in the days before the Albanian state holiday offers of this type had become more pronounced and even intrusive. For example, the prominent Soviet foreign policy weekly "Novoye Vremya," which is intended particularly for foreign countries and is therefore published in numerous foreign languages, published in 8 November a lengthy article which described in detail how the Soviet Union had always supported the Albanians' strivings for their own state and independence, how it had opposed and condemned the Italian occupation of Albania during the Second World War and how it had begun, even before the end of the war, to assist the new authorities in Albania diplomatically and politically and, soon afterward, militarily and politically. After a detailed presentation of how advantageous and useful it was, especially for Albania, to cooperate with the Soviet Union, the article suddenly ends with a laconic and very clear offer, which somehow manages to sidestep the entire period of disputes and conflicts to date: "The fruitful Albanian-Soviet cooperation, however, was interrupted at the beginning of the 60's. The Soviet Union is consistently advocating a normalization of relations with the People's Socialist Republic of Albania, which would be in the interests of the Albanian and Soviet peoples, peace, and socialism."

The next day, IZVESTIYA, a publication of the Soviet government, ran a very similar article. The apparent occasion for both articles was a certain anniversary to which the Soviets had not paid any attention earlier: namely, it was on 10 November 1945 that the Soviet Union had recognized the temporary democratic government of Albania and established diplomatic relations with it. It is evident that this year Moscow wanted to place special emphasis on its willingness to normalize relations, and wanted to do so before 29 November, which is when all the other appropriate offers will arrive to Tirana from the other European capitals.

The Soviet Union has also revived the Soviet-Albanian Friendship Society, which held a special session on the anniversary in question. News agency TASS has reported on it, and it has noted the following in its report: "During the discussion, it was emphasized that the Soviet people nurture feelings of friendship toward the Albanian people and they follow with sincere sympathy the self-sacrificing task of building socialist Albania; the conviction was voiced that the establishment of normal relations between the Soviet Union and Albania would be in the interests of peace and socialism."

It is not at all necessary to specifically point out that similar offers are coming also from other East European capitals. They are different only in that they do not advocate a normalization of relations, since Albania maintains normal diplomatic relations with the other members of the Warsaw Pact --and with some it even has comparatively well developed trade; instead, they advocated broader, more substantive, and more comprehensive cooperation. Stated briefly, the entire Soviet bloc has opened its door wide for Albania and is inviting it in, without posing ideological, political, or any other kind of conditions. This unconditional wooing indicates a great deal of interest.

And what is Tirana's Response to all this?

On 16 November, the Albanian party newspaper, ZERI I POPULIT published a long article devoted to Enver Hoxha's struggle against Soviet revisionims, and at the same time it clearly described the Albanian leadership's stance vis-a-vis the Soviet Union. Among other things, the article said the following: "Our party has always emphasized that the struggle against modern revisionism, above all against modern Soviet revisionism, is not yet over. This is a long struggle that will go on and continue without interruption for the good of Marxism and Leninism, revolution and the peoples. The Albanian Party of Labor is firmly committed to wage this struggle with undiminished consistency and to bring it to an end.

The Door Remains Closed

Regardless of the changes in the Soviet leadership, and regardless of who is in power in the Kremlin, the Soviets remain revisionists in their ideology, imperialists in their policy, enemies of Marxism-Leninism and the peoples; the Albanian party and the Albanian people will never reconcile themselves to this. Our party and state position on Soviet socio-imperialism, as well as on American imperialism, on the two superpowers which are responsible for suffering and poverty and which interfere in the affairs of other peoples and threaten the world with nuclear weapons, is crystal clear. As the First Secretary of the Central Committee of the Albanian Party of Labor, Comrade Ramiz Alija, said: "Albania did not have nor will it have any relations with the United States or with the Soviet Union. Our country was and remains resolutely opposed to their exploitative, expansionist, and aggressive policies."

The position is indeed "crystal clear" and it does not leave open even a crack for the Soviet Union (or for the United States) for any kind of rapprochement. Another (and not uninteresting) question is, to what extent is such an unappeasable position the result of joint persuasion and discussion in the Albanian leadership, and how much it is the personal work of Ramiz Alija, who for a quarter of a century has been the chief ideologue, creator, and spiritual father of Hoxha's ideological war against the Soviet

Union and other socialist countries. Ramiz Alija's personal involvement in this is exceptionally great, and it is therefore unlikely that someone else would be permitted to voice objections against the Soviet Union. While this unusual, even controversial, conduct may stop at a later date, for now, however, the "crystal clear" positions holds true: "We will have nothing to do with the Soviet Union."

The changes, as much as it is possible for one to spot them, are directed elsewhere--toward the smaller member countries of the Warsaw Pact. Albania is not so uncompromisingly hostile toward them, and it does not treat them all the same. It is quite friendly with Romania, and it has some trade with East Germany, Hungary, Czechoslovakia, and Bulgaria; recently, that trade has been increasing. Here, one could speak of the appearance of doors that are less tightly closed than was the case in previous years.

A much wider fissure toward the outside world can be noticed insofar as the West European capitalist countries are concerned, which appears to run contrary to Tirana's ideological hostility. That hostility, however, is only apparent. In reality, the Albanian leadership feels that Albania's independence is more threatened by the East, because the East is directly interested and its appetite is greater. For that reason, in resolving its main problem --economic survival--Albania on the whole turns more toward the West. Economic autarchy is Albania's credo, and it is a heavy burden. Hoxha's policy of almost total isolation has improverished the country. Furthermore, Albania has exhausted its modest industrial resources, chiefly because of its refusal to cooperate with other countries. The factories, built with Soviet and later with Chinese help, are obsolete, there is a lack of spare parts and equipment, and many have been idle for years. The way out of this blind alley is possible only through cooperation with other countries.

Always Better with Greece

The main points of such cooperation are Greece, Italy, West Germany, and Great Britain (and Yugoslavia--but more about this later). Relations with Greece are changing the fastest; for years these relations were burdened with border incidents, Greek complaints over the treatment of the Greek minority in Albania, and not least by the fact that formally the two countries are still at war. This year, the socialist government in Greece took steps to end the state of war, and at the same time there was a revival of cooperation in various areas. Since 1981, trade has been constantly increasing, and next year the two countries will conclude a new trade agreement from which they both expect a great deal. In mid-November of this year there was a meeting of the mixed committee at which tourist cooperation was discussed; in a short while, negotiations will begin regarding joint exploitation of the river Aos, Sarantaporos, and Drim, which flow along the Greek-Albanian border, Greece is also the only country to have a regular weekly air connection with Tirana.

Italy and France (especially the former) were at one time Albania's traditional partners, and continue to be that to some extent, although on a much smaller scale than before. Here, the door opened an inch. In addition to a trade agreement with Italy, an agreement was signed on joint oil prospecting in the Adriatic and on cooperation in the area of communication technology. As far as France is concerned, a trade delegation led by deputy foreign minister visited Tirana in September of this year. This was the first French state visit to Albania.

Best developed are economic relations with West Germany, even though Albania does not have diplomatic relations with that country. The stumbling block is the Albanian demand for the payment of war damages amounting to approximately three billion dollars. Periodic indirect negotiations on this have failed to produce results until recently when, in direct meetings, Albanian and West German representatives have, or at least they claim to have, found a way to a compromise. Albania is not demanding payment of war reparations in money any more, and is not quoting amounts; instead, it expects West Germany to "make it up morally" in the form of industrial equipment and technical know-how. This might be acceptable to West Germany and a possible agreement would certainly revive trade to a large extent, which right now amounts to at least 30 million dollars.

Something similar is taking place with Great Britain. In October 1946, two British destroyers ran into mines in the straits of Corfu; one sank, the other suffered major damange, and 38 British sailors lost their lives. Great Britain maintained that the mines were laid by the Albanians, it sued Albania at the International Court in the Hague, and the International Court ordered Albania to pay 2.4 million dollars in damages. Tirana, however, resolutely denied any wrongdoing, maintained that the mines had been there from the war, and refused to accept the verdict from the Hague. This led Great Britain to confiscate two and a half tons of gold that the former King Zogu had deposited in Italian state banks. From that time, Albania has been demanding the return of that gold, which became and continues to be the main obstacle to relations between the two countries. This year, Tirana announced for the first time that meetings with the British had been arranged in order to discuss this issue. This could therefore be interpreted as a sign of opening up and requesting cooperation.

There is no doubt that Albania desires this, or to put it more precisely, needs it. All these connections are still modest, limited to short term changes, which must be negotiated every year with each partner separately (for instance, the Albanian constitution prohibits taking out foreign credits), and is based on those capabilities in raw materials and production that Albania already has available. This is primarily chrome (Albania is the second largest exporter of chrome, after South Africa), copper, gasoline, pyrites, nickel, tobacco, and food.

Tangled Relations with Yugoslavia

It is certainly of special interest to us how much this apparent and restrained opening up affects Yugoslavia. Our relations are certainly exceptionally complicated since, on the one hand, both states are interested in each other's independence and autonomy because this is directly tied to their international position and security and, on the other, their necessary coexistence is burdened with every intense historical, ideological, nationalistic, and other difficulties. These difficulties are so intense that, viewed soberly, it is not possible to expect any quick or spectacular reverses.

In the last few days, weeks, and months, however, we have noted certain events that indicate certain shifts. For example, a Yugoslav trade delegation, led by Federal Secretary for Foreign Trade Milenko Bojanic, visited Tirana in mid-November. On 16 November, a trade agreement was signed for the 1986-1990 period, as well as a protocol on trade in goods and the method of payment for 1986.

According to that agreement, the two countries will during the next five-year period exchange trade valued at 680 million dollars, which is 20 percent higher than in the previous period. Yugoslavia will (as before) export to Albania machinery, equipment, chemical products, non-ferrous metals, and certain consumer goods. It will import from Albania chrome, electricity, chemical products, tropical fruits, food, and tobacco. The value of this year's trade will amount to approximately 100 million dollars, and it will be 25 percent higher than in the previous year.

As far as Albania is concerned, the railroad line from Tirana, through Scutari to the Yugoslav border, will be of exceptional significance. This line is almost finished on both sides and it will soon begin to operate. With this line, Albania, which until now had only one line from Durazzo on the Adriatic to Tirana, will be included in the European railroad network. This will be through Yugoslavia, which is Albania's natural geographic route to Europe. Because of the existing political relations, however, this "normal situation" is something exceptional.

An exceptional circumstance, that has been viewed abroad as something worthy of a sensation, is also worth mentioning: recently, two Albanians from Kosovo fled to Albania. Moreover, they fled from prison, where they were serving lengthy sentences because they had set bombs in Pristina. The Albanian authorities caught the escapees and returned them to Yugoslavia. While we could say that Tirana has no intention of becoming a haven for its terroristically minded compatriots from Kosovo, and that is has therefore acted in accordance with its own interests, one should still note that it would have been easy to get rid of the unwanted quests in another way, and that for that reason their extradition to Yugoslavia should be taken as an act of good will. Lastly, we should note a minor thing that certainly fits into this pattern, namely that, after a long time, a Yugoslav journalist, a correspondent of the Belgrade NIN, was allowed to visit Albania and write about it.

Consequently, something is undoubtedly shifting in this regard. It would seem, however, that it is too early to tell what it is.

REPORT ON PROCEEDINGS OF ANTONOV TRIAL

Prosecutor's Summation

AU202131 Sofia BTA in English 1900 GMT 20 Feb 86

[Text] Rome, February 20 (BTA special correspondent Nencho Khranov and BTA correspondent Khristo Petrov)--Prosecutor Antonio Marini's summation before the Rome Court of Assizes, which is examining the case of the papal shooting, entered into its seventh day today. Every following court session is increasing the audience's awareness of the fact that the prosecutor has not set before himself the task to analyze the facts that have been brought to light and prove during the court proceesings, but rather that he has seen it fit to deliver a political propaganda esssay inspired by anticommunism. Mr Antonio Marini is no mere follower of investigating Magistyrate Ilario Martella's line but is also adding to it his own contributin to the strengthening of the "Bulgarian connection."

The cornerstone of this trial is everything said by Agca and confirmed by the objective elements of this trial. This is what I have to say," roared Rome's deputy prosecutor general. However, during the last seven months all present in Foro Italico have witnessed the complete moral and juridicial defeat of the slanderer Mehmet Ali Agca and his coaches.

Mr Marini has his trump which he produces at every session while reading his summation: Valcin Ozbey's testimony. The prosecutor used it again as his heavy artillery today. Why? "Ozbey has been the only voice, basides Agca, to speak about the Bulgarian secret services' involvement," said the prosecutor. He is right, but only Ozbey himself changed his testimony several times while giving it and finally admitted to having lied. He was compelled to repeat everything said by the witness Catli in respect to the 500,000 dollars reward offered them in exchange for their backing Agca's lies.

The prosecutor totally neglected this and even quoted quite arbitrarily from the perjurer Ozbey's coached statements. This witness has never spoken of concrete facts or persons, of personal impressions, but has rather referred to stories told to him after the attack by third parties. These stories were refuted before the court by Kadem and Catli (Celik's close friend), who called the "Bulgarian connection" a fabrication.

The only thing that Mr Marini squeezed out from Ozbey was a general statement that the Bulgarian secret services had shown an interest in the assassination but later on lost this interest and deserted Agca and his pals. Mr Marini did not specify when this interest had been lost. Thus even at this point Ozbey could be of no use to the prosecutor.

He was reduced then to listing hints, conjectures or references to witnesses who have not been questioned in court or who are directly linked with the U.S. Central Intelligence Agency.

The prosecutor's picture was all too elementary. The "Grey Wolves" needed money, and they were promised that money by the Turkish Mafia through Celenk, who in turn allegedly put them in touch with the Bulgarians. The counsel for the prosecution cited an argument between Agca, Celik and Catli in Turkey about the target of attack: Whether the head of the Catholic Church or the patriarch of the Armenian Church, the decision to kill the Pope prevailed--because it was in the interest of the Eastern countries, to undermine Poland's Solidarity." But when did it happen? In 1979. It was then that the Mafia allegedly helped Agca escape from the jail in order to recruit him for the assassination plot. But, as is known, there was no Polish crisis in 1979, and Solidarity was still nonexistent. [sentence as received] This question, however, was not at all addressed.

All arguments of the prosecutor concerning the "Bulgarian connection" boil down to a single complaint: that it is a cripled trial because the prosecutor has requested the questioning of a number of other witnesses and the carrying out of a number of procedures other than the ones conducted, but his requests have been rejected.

Marini made one quite significant admission: "While in the other direction (meaning the 'Grey Wolves' track) there are so many facts that Celik's guilt is undeniable, in this direction (i.e. the Bulgarian connection) we are left only with the voice of Agca."

In order to prove the prosecution case, Prosecutor Marini took recourse to many words and few arguments, to constant repetitions which were intended to supersede the analysis and the rationale and to thrust his conclusions on the courtroom. It is precisely because of his verbosity that the prosecutor asked for a second extension of the time limit set to his summation. He did not only fail to keep his promise to wind up in four or five hearings, but even requested that the second deadline be moved. He was due to be through by this week's end, and now demanded two more hearings to complete his final arguments: on next Tuesday and Thursday [25 and 27 February]. This will automatically delay the completion of the trial.

The next hearing will be held on Saturday [22 February].

Summation Continues

AU252150 Sofia BTA in English 2052 GMT 25 Feb 86

[Text] Rome, 25 February BTA Correspondent)--The nearer the prosecutor comes to the end of his summation, the more obviously he demonstrates that his mission at this trial is to defend the slander encoded as the "Bulgarian Connection," to create around Agca the halo of credibility, to conceal and manipulate with the hundreds of facts and testimonial evidences which expose the slander and its authors. [sentence as received].

"Antonov's alibi for 13 May 1985 does not stand and has not been confirmed by the documents in the trial," stated the counsel for the prosecution. According to him, Anotnov and the other witnesses (Bulgarians and Italians) have made changes in the temtimonies they had given to the investigating magistrate. They had said in the beginning that Rositsa Antonova had been in Rome at the time but had then recollected that she had left for Bulgaria five days earlier than the said date. Here the reference was about the fact that in the afternoon of 13 May 1981 Antonov had not left the Balkanair office but the testimonies to this effect had never been modified by anyone. There are witnesses, like the Italian Pietro Parisi for example, who has never spoken about Rositsa Antonova's presence in Rome, thus exposing Agca's slander. If someone has in fact changed his testimony in respect to the said afternoon, that person was Agca himself. The assailant had claimed that Antonov had been with him in St. Peter's Square until 5 pm but after learning about the witnesses' testimony he moved the timing forward by one hour.

A second mystification presented by the prosecutor: "Antonov's presence in the Balkanair office is not confirmed by Antonia Popkrustevas ' phone call since she could not have seen 'Scenes' from the shooting on television as these had been transmitted at about 7 pm," claimed Marini as Magistrate Martella had done earlier. Antonia Popkrusteva is the elderly mother of one of Balkanair's women employees who had seen the T.V. broadcasts and had immediately phoned the Balkanair office, accidentally getting in touch with Antonov. This had happened immediately after the assassination attempt at a time when according to Agca the Bulgarian employee had been waiting for him in a car close to the site of the shooting. Very much like Martella, Marini now claimed that television had still not broadcast "scenes" from the shooting at that time. However, "LA STAMPA" of 14 May 1981 carries a report from an Italian TV studio which reads: "A few minutes after the attack, RAI transmitted an extraordinary TV news bulletin simultaneously on the first and second channels. This was a very quick reaction which has almost no precedents."

A third mystification by the prosecutor: "Antonov is even now in good health but he refused to stand the interrogations, and besides, his predecessor to the post has been expulsed [as received] from Italy," stated the prosecutor. In this case he surpassed himseif in his characteristic twisting of facts. There are the most authorative conclusions of highly qualified professors of medicine, who had examined the Bulgarian upon the request both of the defense and judicial authorities, but the prosecutor never bothered to discuss them. Instead he repeated the lie about Anotnov's predecessor, expulsed from Italy. [quotation mark as received] The said person is called Pencho Rusev and has never been expulsed by the Italian authorities, which could easily be checked.

Fourth prosecutor's mystification: "the trip of Rositsa Antonova has not been corraborated and that means that it does not exist," continued the prosecutor. There are witnesses and documentary evidence and confirmations for the trip and they are not only from the Bulgarian side. Rositsa Antonova had left Rome on 8 May 1981, and together with the family of Donka and Kosta Krustevi, in their car, she had passed through Italy and Yugoslavia to reach Sofia on 10 May--Exactly on this date Agca had alleged that he had seen her in the apartment of Antonov in Rome. Apart from the evidence of a number of witnesses, this fact was corrobroated also by the documents reflecting Rositsa Antonova's spending of the night in the "Motel Tourist" in Yugoslavia.

Fifth prosecutor's mystification: "Antonov had said that he had been in Milano during October or November 1981, but he could have been there during the same time in 1980, when Ali Agca and Harun Celik (the name of Oral Celik in his false passport--Corr.'s note) had stayed in that town," assumed the prosecturo. Proofs? None. But after Agca had shifted Antonov's "presence" in St. Peter's Square with one hour, why should the prosecutor bother for one year?

Sixth prosecutor's mystification: "Agca had not been masterminded because he had identified the three Bulgarians on the photographs. These photographs had been numbered and distributed in an album, but the investigating magistrate had the right to do this and it is only in police departments where the arrested are shown a heap of unarranged photographs," shouted Marini. And this was said by a magistrate who boasts with his great experience! There is nothing more proper for him than the showing of an album to a criminal, with photographs of Bulgarian citizens only, numbered from 1 to 56, and then saying to this criminal: "Well, now you should identify who are those Bulgarians on photographs No. 1, 2 and 20." And Agac "identifies" them. Unfortunately he had said that Zhelyo Vasilev was rather taller than Todor Ayvozov. Just the opposite is true, and the difference in their height is 20 centimeters, but it does not appear on the passport pictures, which have been shown to Agca. Naturally Marini does not fuss over this "trifle."

Seventh prosecutor's mystification: "The plan for attempt on the life of Lech Wasesa, described in detail by Agca, concerns this trial as well, because he had come to Italy as early as November 1980, while the assassination attempt against the Pope had taken place as late as next year's spring," said Marini effusively. Marini got beyond Martella with this. Because the investigating magistrate had also started on this "track", but after Agca's confessions that that had been a lie, he had found himself forced to charge him with slander. Then Martella remembered that he could not bring the innocent Bulgarians to trial on the basis of evidence of a "witness" charged by him for slandering. That is why he had closed down the whole "Walesa part" and removed the charges against Agca. Now Marini sets it forth once again. Because he wants to connect in some way Zhelyo Vasilev to this trial--the last of the slandered Bulgarians, whose name he mentioned as late as today.

Such was the construction of one absurd and contradictory to elementary logic accusatory thesis, [sentence as received] which had only one motive and only one aim: to continue the vilification of Bulgaria and her citizens, to free the anti-communist propaganda.

The trial will continue tomorrow.

Further on Summation

AU262210 Sofia BTA in English 2127 GMT 27 Feb 86

[Text] Rome, 26 February (BTA Corr.)--Prosecutor Antonio Marini divided his summation today into two parts: A noisy anti-Bulgarian lecture in the morning and a session of empty words in the evening. In the latter part he almost confessed that he lacked proofs in support of his unbelievable case.

He opened the morning session with the allegation that Todor Ayvazov's alibi was invalid. His "argument" was again that this alibi had been supported by Bulgarians only. According to this magistrate all Bulgarians lack credibility. His pseudojuridicial rhethorics quite naturally entered him in ridiculous contradictions.

"Why did Ayvazov state that the customs clearance of the Bulgarian transport international lorry had been an urgent matter? What an unusual operation this had been?" asked Marini insolently.

The answers to his questions are to be found in the very documents he is so fond of busying his hands with. The answer is that the truck had been carrying alcoholic drinks for a reception given by the Bulgarian Embassy and its route and stay in Italy had been strictly scheduled according to the Italian laws.

In this connection the counsel for the prosecution maliciously went out of his way to remind the court of investigating Magistrate Ilario Martella's idea, broadly discussed in his indictment, according to which Bulgaria and her official representatives were the organizers of international terrorism. Speculating with dates, he attempted to link Ayvazov's alibi with certain activities of other Bulgarians who had allegedly tried at that time to establish contacts with terrorists of the Red Brigades in order to obtain "secret information" from the American general James Dozier, who had been kidnapped by the terrorists. However, this operation had nothing to do with any Bulgarians. What is more Ayuvozov's alibi concerns the period between 10 May and 13 May 1981 while the general was kidnapped on 17 December 1981.

Prosecutor Marini was honest only once: He admitted that he had again included in this trial the "Walesa" episode in order to involve Zhelyo Vasilev. After the court executed its rogatory commission in Sofia last December where it interrogated Vasilev, the prosecutor has obviously understood that this Bulgarian had an alibi corroborated by circumstances, fully documented by the Italian authorities. Thus he had probably seen that "the Bulgarians cannot be credited" formula would not do in Vasilev's case. Thus he decided to resort to the "plan for the assassination of Lech Walesa" shelved earlier, in order to use Agca's few available slanders against Vasilev.

Marine was also very dillegent in seeking other sources of insinuations against Bulgaria. He even referred to Italian ex-Defense Minister Lagorio who appeared before parliament on 20 December 1982 to state that "the attempt on the Pope's life is a peacetime act of war" and that "as early as 8 September 1982 the Sofia papers had tried to discredit Agca and to react before he had made his revelation." He reached, however, one very long-standing question which he (very much like the investigating magistrate) tried to avoid: Why if the Bulgarians had known about Agca's revelations did they let his "accomplice" Antonov continue working in Rome as though waiting impatiently to be [word indistinct].

These days, all those present in foro Italicum were compelled to listen to political propaganda which often used methods reminiscent of the cold war years. Tonight, Mr Marini mentioned that he could ask for a resumption of the court's investigation. If he really does so he will virtually be admitting publicly that he (?has) no proof against the three innocent Bulgarians.

Prosecutor's 'Strange' Conclusions

AU222126 Sofia BTA in English 2056 GMT 22 Feb 86

[Text] Rome, 22 February (BTA corr.)--At today's session the prosecutor Marini set himself to prove three things: that Sergey Antonov had belonged to the Bulgarian secret service, that Antonov and the criminal Agca has spoken English enough to understand each other, and that the evidence of the witnesses and the documentary proofs about the absence of Rositsa Antonova from Italy in the period after 8 May 1981 had been unstrustworthy.

First of all the prosecutor declared that he had reveiwed all elements piled up in the course of the investigation and the judicial inquiry in order to estimate the situation and individual responsibility of each of the defendants. Right away after that he refuted himself.

"Agca had said that Antonov belonged to the Bulgarian secret services. Ozbey did not say such a thing concretely about Antonov, but in general he said that the Bulgarian secret services had shown interest. Antonov had come to Rome to replace another employee of Balkan who had been expelled from Italy, and he had even moved into his apartment on "Pola" Street. That means that Antonov belongs to the Bulgarian secret services," such was the absurd conclusion of Marini. Once again he based his arguments on the perjurers Ali Agca and Yalcin Ozbey, who had been his only source of "objective corroboration" during these days. Not a word was spoken, however, by Marini about the mission carried out by Ozbey commissioned to him by the Western secret services: For half a million U.S. dollars he had to provide perjurers from the organization of the "Gray Wolves" in support of the slanderer Agca, and that has been recorded in this trial.

What is more, in an offhand manner Marini misrepresented one fact. Sergey Antonov has replaced in Rome the former deputy representative of "Balkan"--Pencho Rusev, whose mandate has been completed and who had never been expelled from Italy. This fact is well known to the Italian authorities. It is impossible that the prosecutor should not know it as well. It was he who asked the witness Silva Petrova Popkrusteva on 17 October, last year, this very question and the employee with many years of service in the office of "Balkan" in Rome answered him most precisely, giving names and dates.

In connection with the second of his conclusions, that Sergey Antonov and Ali Agca "spoke English enough to understand each other," Marini based his argument on the inventions of two ex-Bulgarian citizens--Magdalena Veleva and Velichko Peychev, a paid disinformer in the subversive radio station "Free Europe" which is financed by the CIA. They had said before the investigating magistrate Illario Martela that Antonov had to speak English in order to work in the Bulgarian airlines "Balkan." But the regulations for application for work in the Bulgarian airline "Balkan," enclosed to the records of the trial, translated into Italian and presented by the Bulgarian investigating authorities, very clearly read that the candidates for employment in the Bulgarian airlines should be able to speak one Western language and Antonov had passed an exam in French. That is obvious from the evidence of all employees of the representations of "Balkan" and "Balkantours" in Rome, from the evidence of the insurance agent Antonio Kolaboleta, of Pietro Parisi, of the administrative director of the Turkish airlines in Italy Mat Mohamed Sabit, of the deputy representative in the same company Sabato Matrone, of the advertising agent Roberto Pankari, of the employee at the Roman airport Carlo Patrizi, all of them had known Antonov for years and all of them categorically had declared that he could not speak English. On the other hand the proprietor of the boarding house Isa Maorizio Paganeli, had confirmed before the court that Ali Agca had known only a few English words and he had used gestures when he had to ask for the key to his room.

No less biased were the efforts of the counsel for the prosecution to declare untrustworthy the evidence of Antonov and a number of other witnesses, as well as the documentary evidence, that Rositsa Antonova had left Italy on 8 May 1981, and that it had been impossible for her to be present at the famous "meeting" in the house of Antonov on 10 May, the same year, which had been described by the slanderer Agca. The fact that Antonov had not remembered at once that his wife had not been in Rome at that time, was just the result of the monstrous charges and psychological pressure exercised over him during the first interrogations. But according to the "logic" of Marini, memories had to be clear and exact even after a year and a half had passed from the events.

There is also another strange conclusion drawn by the prosecutor: "Is it normal for a Bulgarian citizen to be interested so much in the assassination attempt against the Pope, to listen to the radio and to call the central which reports the latest news?"

Being unable to deny the evidence of the family of Kosta and Donka Krustevi, who, together with Rositsa Antonova, had travelled by car from Rome to Sofia on 8 May and 9 May 1981 the counsel for the prosecution said that there had been some corrections in the bill for their spending of the night at the "tourist" motel in Yugoslavia. There are some corrections because the administration of the motel have made some mistake turning the prices in Italian lires with which they have paid their stay. But Marini did not say anything about the register of the motel, where the names of Krustevi and Rositsa Antonova had been written clearly together with the numbers of their passports and even the hours of their arrival and departure.

The records of the trial also contain one other document presented by Sergey Antonov's counsel for the defense. It is a verbal note from the Bulgarian Embassy in Rome to the Ministry of Foreign Affairs of Italy, dated 7 May 1981. It requests an extension of the term of their stay and the issuing of visas. The prosecutor tried to maintain with the help of this note that Rositsa Antonova had not been able to leave because she had had to deposit her passport with the Italian ministry.

Agca's prompters had thought the same, because it had been on the basis of the date written in the note--7 May 1981, that they had made him cite his story about the "meeting" in the house of Antonov, attended by Rositsa Antonova as well. But the truth lies in the fact that because of the sudden departure of Rositsa, the note had been lodged with the embassy [as received] of foreign affairs as late as 27 May 1981. That fact had been reported to the investigating magistrate Ilario Martela and immediately after that it had become known also to Agca, who had called the investigating magistrate right away, and out of fear not to be unmasked he had declared that he had never visited the house of Antonov. But how had he been able to describe in detail the apartment he had never visited? That is another question to which the prosecutor Marini probably will not answer at the next session as well.

The trial will continue on Tuesday [25 February]. The presiding judge Severino Santiapichi has fixed a time for the prosecutor to finish his speech on Thursday, 27 February.

COMMENTS ON 27TH CPSU CONGRESS

AU241748 Sofia BTA in English 1644 GMT 24 Feb 86

["Congress of Peace and Creativity"--BTA headline]

[Text] Moscow, 24 February (BTA Special Correspondent Nencho Khranov)--The Soviet Union is now in the eve of a historical event: The 27th Congress of the CPSU is to open tomorrow. This is a historical event since the Congress will discuss and approve the party's new strategy for improving the rates of the country's socio-economic development, for the reaching of a qualitatively new stage in the development of the Soviet society. The revolutionary nature and the wide scope of the tasks, set by the Leninist party, are of historical international importance. No doubt the Congress will give a new impetus to the Soviet Union, to the socialist community and to all peaceloving people the world over in their struggle to attain mankind's noble aim: the entry into the third millennium under peaceful skies and space.

The Congress will examine the drafts for a new edition of the CPSU program and for the main trends in the USSR's socio-economic development during the twelfth five-year period and for the period till the year 2000, as well as the changes in the CPSU Charter.

These documents were offered for an all-party and nation-wide discussion. This has demonstrated the strength of the Soviet society and the unbreakable unity between the party and the people. The discussion showed the full approval for the course aimed at accelerating the rates of the socio-economic development, at the further improvement of the forms and methods of party leadership, of the overall economic and party work. The nation's participation in the preparatory work for the Congress is a convincing demonstration of the Soviet people's determination to do everything possible for the fulfillment of the great tasks set by the party.

The CPSU's economic strategy corresponds to the requirement to accelerate development and to improve living standards, to consolidate the potential of the national economy, to keep the country's defence potential at the necessary level. An important instrument for the intensification of the economy will be techno-scientific progress. The Soviet Union's national income and economic output will double by the year 2000 and the country will create an economic potential equal in scope to what has been done during the nearly 70 years since the October revolution.

The preparatory work for the [word indistinct] Congress of the CPSU coincided with the elaboration of a new program for a complete elimination of all nuclear weapons and for the prevention of the militarization of space. These extremely important peace initiatives, included in Mr Mikhail Gorbachev's declaration of 15 January 1986, were met with the world progressive public's approval and raise hopes world-wide. And as an article in today's PRAVDA states, this program has further strengthened the international significance of the forthcoming forum of Soviet communists.

BULGARIAN BALKAN COMMITTEE ACTIVITIES REVIEWED

AU180906 Sofia RABOTNICHESKO DELO in Bulgarian 13 Feb 86 p 6

[BTA report: "Sincere Striving for Good Neighborly Relations"]

[Text] The Committee for Balkan Understanding and Cooperation devoted great efforts in 1985 in connection with intensifying its cooperation with representatives of the public, as well as with affiliated organizations from other Balkan countries and in explaining the urgent necessity of joint struggle of the consolidation and development of mutual understanding and good neighborliness. Thus, the committee contributes to the peace-loving foreign policy of the People's Republic of Bulgaria aimed at reaching the hearts and minds of ever-expanding strata of the population in various Balkan countries.

At meetings and talks with public figures and cultural leaders from the neighbor countries, the committee tried to establish a dialogue on the urgent problems of the Balkans and to find adequate forms for the propagation and consolidation of the proposal for signing bilateral agreements containing a good neighborliness code and renunciation of territorial claims that should be instilled in the consciouseness of the Balkan public. Particular attention was devoted to the noble idea of transforming our area into a nuclear-free zone. The appeal launched by the Comrades Todor Zhivkov and Nicolae Ceausescu at the end of the year 1985 to the state and government leaders of the Balkan countries for the transformation on the Balkans into a chemical-free zone gave a new impetus to the joint struggle of the Balkan peoples for a total ban on the most destructive modern weapons in the entire area.

Through varied information and propaganda activities, the public in our country, as well as in the other Balkan states, was acquainted with the specific steps taken by the People's Republic of Bulgaria in consolidating mutual trust and cooperation among all countries of this area.

These activities were discussed at yesterday's meeting of the Bulgarian Committee for Balkan Understanding and Cooperation. Boris Velchev, chairman of the committee, read a report on the committee's work in 1985.

Dimitur Stanishev, secretary of the BCP Central Committee spoke on the stabilizing role of our country's Balkan policy as a natural expression of its comprehensive, consistent, and constructive policy to the advantage of peace, understanding and mutual confidence among the peoples. He stressed the positive role played by the committee in propagating this policy and in making the other Balkan states familiar with the Bulgarian's achievements in public life.

BULGARIAN BORDER GUARDS MEETING HELD IN SOFIA

AU152200 Sofia RABOTNICHESKO DELO in Bulgarian 13 Feb 86 p 6

[Dragomir Penchovski article: "Reliable Shield of the Motherland"]

[Text] The 20th conference of the nationwide border guards' BCP organization took place yesterday at the Sofia Hall of the Central Committee of Fighters Against Fascism and Capitalism. Dimitur Stoyanov, candidate member of the Politburo and Minister of the Interior, participated in the work for the conference.

The report and the speakers' statements stressed that the entire activities of commanders, political organs, and party organizations during the period under review was aimed at the implementation of the tasks stemming from the decisions of the [words indistinct], from the decisions of the National BCP Conference on quality, and from the BCP Central Committee plenums. Expressing themselves still dissatisfied with their achievements, the delegates to the conference, in a critical and self-critical spirit, sought the reasons of the shortcomings that were allowed to occur in party-political work and mapped out measures for the improvement of their comprehensive activities in protecting the borders. The decisions of the February 1985 and the January 1986 BCP Plenums are assigned new tasks to the soldiers of the Border Guard Troops, as well. These decisions are of great importance in mobilizing work and raising the quality of the border guards activities in protecting the native borders to a higher level, as well as in improving their political activities.

In his speech, Comrade Dimitur Stoyanov mapped out the chief trends in the activities of commanders and political workers, as well as of all communists. The complicated international situation, created by the imperialist forces, demands that the soldiers with the green shoulder straps manifest great combat readiness, vigilance, and discipline in order to guarantee a calm and peaceful labor to the population in our country, the minister stated.

ZHIVKOV FOUNDATION BRANCH FORMED IN LONDON

AU141700 Sofia RABOTNICHESKO DELO in Bulgarian 13 Feb 86 p 5

[RABOTNICHESKO DELO correspondent Petur Bochukov report, datelined London, 12 February: "Continuation of a Noble Cause"]

[Summary] A British branch of the "Lyudmila Zhivkova" Foundation was established in London on 12 February, under the name of the "Lyudmila Zhivkova International Foundation (England and Wales)." Its formation was announced officially at a meeting of the Administrative Council of the fund, chaired by Robert Maxwell, chairman of Pergamon Press Publishers, and attended by Vladimir Zhivkov, deputy chairman of the Bulgarian Committee for Culture. Other participants in the meeting were the former labor minister John Silkin, George Robertson, Liberal Party spokesman on foreigh affairs, Bulgarian Ambassador Kiril Shterev, and Ivan Nedev, chief secretary of the foundation.

The meeting elected Robert Maxwell, "who is founder member of the 'Lyudmila Zhivkova' foundation and member of the its Bureau and Council," as chairman of the London branch. The branch leadership includes John Silkin, Ron Todd--president of the Transport and General Workers Union, and members of Parliament Michael Cox and George Robertson. There was a discussion of the branch's future activity, "which will include the granting of scholarships to young people to specialize in Great Britain in various fields of arts and science, mutual exchanges of collections between the foundation's art gallery and British galleries, etc."

The meeting was followed by a reception given by Robert Maxwell in the Howard Hotel, which was attended by "prominent representatives of British cultural, political, and business circles, leaders of diplomatic missions accredited in London, including the Soviet Ambassador Viktor Popov, and many journalists." Vladimir Zhivkov made a speech at the reception. In the evening Robert Maxwell gave a dinner in honor of Vladimir Zhivkov, attended by "members of the Administrative Council of the British branch of the foundation and representatives of British political, scientific, and cultural circles."

LEADERS ATTEND OKRUG BCP CONFERENCES

Dzhurov in Veliko Turnovo

AU180837 Sofia RABOTNICHESKO DELO in Bulgarian 14 Feb 86 p 8

[Unattributed report: "In a Busin Slike, Critical and Self-critical Amnner"]

[Text] Veliko Turnovo, 13 February, RABOTNICHESKO DELO report. Today the fourth accountability-election conference of the Veliko Turnovo BCP City Organization took place. It was attended by Army General Dobri Dzhurov, member of the BCP Central Committee Politburo and minister of national defense, and Nikola Tsonev, first secretary of the Veliko Turnovo Okrug BCP Committee.

The report and subsequent debates analyzed in detail the results of the comprehensive socioeconomic development of the city. The undoubted successes in intensifying the economy and in the multifaced activity in turning Veliko Turnovo into a historical, cultural, and tourist center were stressed with justification. The weaknesses and shortcomings which have been allowed were reviewed in a critical and self-critical manner.

Comrade Dobri Dzhurov stressed that the Veliko Turnovo party organization is working diligently to put into effect the party order on quickly introducing the achievements of the scientific-technological progress. He also dwelled on some unsolved issues and stressed the necessity of constantly perfecting the organizational and political work of the party committees and primary organizations and all communists in accordance with the high requirements of the decisions of the BCP Central Committee February 1985 and January 1986 plenums.

Stanishev in Khaskovo

AU222012 Sofia Domestic Service in Bulgarian 1000 GMT 22 Feb 86

[Text] The 21st Okrug BCP conference in Khaskovo is continuing its work. Comrade Dimitur Stanishev is taking part in the conference. The reports and speeches of the delegates, as well as dealing with the successes achieved, devoted considerable space to the unresolved problems of the Okrug's economy. Radi Stanchev, the delegate from the (?Marvas) economic mining and energey combine and twice a hero of socialist labor, pointed out that the decision for the renewal of the material-technical base of the combine is not being properly carried out. Shishko Shishkov, the delegate from Dimitrovgrad, pointed out that the investment and reconstruction process does not conform to the modern requirements. As an example, he pointed out that 24 different organizations are taking part in reconstruction and modernization in their work, the rates of progress are being held up. The conference is continuing its work. [Sofia Domestic Service in Bulgarian at 1830 GMT on 22 February, in reporting on the same conference, adds: "At the plenum held after the conference, Stoyan Peykov was reelected first secretary of the Khaskovo Okrug BCP Committee."]

Stoichkov in Stara Zagora

AU221709 Sofia Domestic Service in Bulgarian 1830 GMT 21 Feb 86

[Text] Stara Zagora--In the presence of Comrade Grigor Stoichkov the 24th accountability-election conference of the Stara Zagora Okrug BCP Organization was held here today.

The report and the statements of the delegates made a thorough analysis of the successes achieved and of the existing problems. Comrade Grigor Stoichkov delivered a speech at the conference. He conveyed most sincere greetings to the delegates and guests on behalf of the BCP Central Committee and on behalf of Comrade Todor Zhivkov personally. Comrade Grigor Stoichkov dwelled on the most important tasks facing the communists and working people of the Okrug by drawing special attention to the questions of the further development of the Okrug economy on the basis of the accelerated introduction of the achievements of scientific-technical progress.

The plenum that followed the party conference reelected Mincho Yovchev as first secretary of the Stara Zagora Okrug BCP Committee.

Filipov in Plovdiv

AU221936 Sofia Domestic Service in Bulgarian 1000 GMT 22 Feb 86

[Text] In Plovdiv the 25th accountability-election conference of the Okrug BCP Organization is being held. Comrade Grisha Filipov is taking part in the work of the conference. Being emphasized in the reports and the speeches made by the Okrug and regional programs for the development of certain new fields of science and technology. The delegates discussed with particular acuity certain serious weaknesses connected with the incomplete utilization of the slow mastering of new technologies were subjected to serious criticism and in-depth analysis. [Sofia Domestic Service in Bulgarian at 1830 GMT on 22 February, in reporting on the same conference, adds the following: "At the plenum following the conference, Ivan Panev was reelected first secretary of the Plovdiv Okrug BCP Committee].

Dyulgerov in Kyustendil

AU272027 Sofia Domestic Service in Bulgarian 1830 GMT 27 Feb 86

[Text] With the participation of Comrade Petur Dyulgerov, the accountability-election conference of the Kyustendil Okrug BCP organization was held today. Dwelling on certain of the aspects achieved, the delegates directed their attention toward the unsolved problems connected with the fuller utilization of the cadre and production potential of the Okrug's economy, the technological reequipment of industry, and the mastering of new types of production. At the plenum held after the conference, Yordan Tsanev, hitherto an inspector of the BCP Central Committee, was elected as first secretary of Kyustendil Okrug BCP Committee.

LOCAL ACCOUNTABILITY-ELECTION CONFERENCE HELD

[Editorial Report] Sofia'RABOTNICHESKO DELO in Bulgarian on 7 and 8 February carries reports from local correspondents on accountability-election conferences of provincial and Sofia district party organizations, attended by Politburo members, candidate members, Central Committee secretaries, and other leading officials.

Sofia RABOTNICHESKO DELO on 7 February carries on page 2, an approximately 400-word report from Silistra Municipal Party Organization attended by Yordan Yotov, Politburo member of the BCP Central Committee and editor in chief of RABOTNICHESKO DELO, as well as by Georgi Kardashev, first secretary of the Silistra Okrug BCP Central Committee. Yotov spoke on the five tasks assigned by the February 1985 and January 1986 BCP Central Committee plenums, which require revolutionary changes at the base and in the superstructure, as well as the expansion of the creative efforts and opportunities of the working collectives for an even more offensive and more consistent struggle against negative phenomena in our life."

Antonia Mechkova, in a 400-word report on the same page of the daily, describes the 30th Accountability-Election Conference of the Sofia "Blagevoc" Rayon Party Organization, attended by Milko Balev, Politburo member of the BCP Central Committee and by Georgi Georgiev, first secretary of the Sofia City BCP Committee. Milko Balev pointed out the exceptionally great responsibility of the party organizations for creating an economic, political, and ideological atmosphere within the workers collectives of the rayon, that should conform to the requirements of the 1985 February and 1986 January plenums of the BCP Central Committee."

Nikola Kidikov, in a 400-word report from Kurdzhali, describes the Accountability-Election Conference of the Kurdzhali Municipal Party Organization, attended by Ognayan Doynov, Politburo member of the BCP Central Committee, and by Georgi Tanev, first secretary of the Kurdzhali Okrug BCP Committee. Doynov praised the achievements of the working people in the area and stressed the "necessity of reorganization in the work of party organs and organizations, of leading cadres ansd rank and file communists."

Ninko Gruev, in a 400-word dispatch, reports on the Fourth Accountability-Election Conference of the Vidim Municipal Party Organization, attended by Georgi Atanasov, secretary of the BCP Central Committee and candidate member of the Politburo, as well as by Geno Toshkov, first secretary of the Vidin

Okrug BCP Committee. Atanosov points out the necessity of "introducing new technological methods" and the need "to improve the standard of scientific services to the population."

A 400-word report by Petko Petkov from Sliven describes the Fourth Accountability-Election Conference of the Sliven Municipal BCP Organization, attended by Andrey Lukanov, candidate member of the BCP Central Committee and deputy chairman of the Council of Ministers, and by Velichko Petrov, first secretary of the Sliven Okrug BCP Committee. Andrey Lukanov is reported as stressing the future tasks of the local party organization and the necessity of "new approach" to scientific-technical problems.

Plamen Dzhantov, in a 400-word report from Razgrad, describes the Fourth Accountability-Election Cohference of the Razgrad Municipal BCP organization, attended by Georgi Dzhagarov, deputy chairman of the State Council, and by Anastasiy Donchev, first secretary of the Razgrad Okrug BCP Committee. Dzhagarov is reported to dwell on the "necessity of reorganizing ideological work" in the area, according "to the new criteria facing the local party organization.

Sofia RABOTNICHESKO DELO on 8 February carries on page 6 a 350-word report by Asparukh Georgiev from Kyustendil on the Fourth Accountability-Election Conference of the Kyustendil Municipal BCP Organization, attended by Grigor Stoichkov, candidate member of the BCP Central Committee Politburo and deputy chairman of the Council of Ministers, and by Georgi Grigorov, first secretary of the Kyustendil Okrug BCP Organization. Stoichkov is reported speaking on the "basic shortcomings which are reducing the economic and social efficiency of party organizational work and leadership and which must be overcome."

Nedyalko Atanasov, in a 350-word report from Troyan, reports the Fourth Accountability-Election Conference of the Troyan Municipal BCP Organization, which was attended by Stoyan Makov, candidate member of the BCP Central Committee Politburo and first deputy chairman of the Council of Ministers, chairman of the State Committee for Research and Technology, and by Petur Balevski, first secretary of the Lovech Okrug BCP Committee. Stoyan Markov is reported "positively evaluating the results achieved in recent years" in the area and urging the working people of Troyan to "devote all their intellect, efforts and daring" to the fulfillment of current tasks.

A 250-word report from Mezdra by Ilya Borisov is devoted to the Fourth Accountability-Election Conference of the Mezdra Municipal Party Organization, attended by Stoyan Karadzhov, chairman of the BCP Central Control-Auditing Commission.

A 300-word report by Neofit Petkov from Mikhaylovgrad reports on the Fourth Accountability-Election Conference of the Milhaylovgrad Municipal Party Organization which was attended by Mitko Grigorov, deputy chairman of the State Council, and by Petur Nikolov, first secretary of the Mikhaylovgrad Okrug BCP Committee.

Purvan Todorov, in a 250-word dispatch from Pleven, reports on the 31st Accountability-Election Conference of the Pleven Municipal BCP Organization.

Attended by Georgi Karamanev, chairman of the Social Council attached to the Council of Ministers, and by Stefan Ninov, first secretary of the Pleven Okrug BCP Committee and Ilya Petrov, in a 350-word dispatch from Vratsa, reports on the Fourth Accountability-Election Conference of the Vratsa Municipal BCP Organization attended by Ivan Iliev, deputy chairman of the Council of Ministers and chairman of the State Planning Commission, and by Svetozar Petrushkov, first secretary of the Vratsa Okrug BCP Committee. Iliev dwelled on the "most important and urgent task and on the necessity of a thorough change in the entire praty political and ideological work in order to meet the great requirements and lofty goals of the February 1985 and the January 1986 plenums of the BCP Central Committee."

All reports point out that the speaker emphasis the "importance of the February 1985 and January 1986 plenums" and on the people's succcesses in the aforementioned areas.

No changes in personnel or leadership of the local party organization are mentioned.

BULGARIAN ORTHODOX BISHOP ON PEACE MOVEMENT

AU141945 Sofia BTA in English 1749 GMT 14 Feb 86

[Excerpt] Sofia, 14 February (BTA)--"Life on the planet should be preserved. Civilisation and the achievements of human genius should be used not for the purpose of mankind's predition but for its welfare. The sun of joy and happiness should never set. Therefore, let everyone work for this according to his calling and position."

This is part of the statement which Metropolitan Pankratiy of Stara Zagora, head of the Foreign Relations Department of the Bulgarian Patriarchate and vice-president of the Christian Peace Conference (CPC), made today before a reporter of the Bulgarian Telegraph Agency. The interview was occasioned by the forthcoming session of the CPC governing bodies due to be held in Sofia from March 2 through 7 at the invitation of the Bulgarian Orthodox Church, a respected member of the Christian peace movement.

The Sofia session is the first meeting after the 6th CPC All-Christian Peace Assembly, held between July 2 and 9 last year in Prague. It will be attended by some 100 delegates from 30 countries on the five continents. Along with other important questions of peace and social justice, its agenda includes a report by a Bulgarian representative devoted to the need for the establishment of a Balkan nuclear- and chemical-weapons-free zone as an important step towards detente and peace.

"The Christian Peace Conference is an oecumenical movement which epitomizes the Christians' responsibility for peace, social justice and dignified human life," Metropolitan Pankratiy indicated explaining the essence and the objectives of the organization. "It advocates constructive relations and safeguards for peace, peaceful settlement of all international disputes without recourse to force, general and complete disarmament, as well as cooperation among all nations on the principle of peaceful coexistence."

OTECHESTVEN FRONT ON FAMILY REUNIFICATION CASE

AU191823 Sofia BTA in English 1436 GMT 19 Feb 86

[Text] Sofia, 19 February (BTA)--Mikhaela and Severina Filipova, aged seven and five, left for Rome today via Vienna by airplane. They are the daughters of Svezha and Mikhail Filipov, who have left Bulgaira illegally three years ago. The 85 year old Mariya, mother of Mikhail Filipov, also left with them. The two children and their grandmother received the permission of the Bulgarian authorities to leave for Italy. During the flight to Rome they will be accompanied by several Italian citizens, friends of the Filipov family.

In connection with this case, which has been used recently or speculation by some Italian newspapers, follows a reissue of a reportage of the Sofia daily OTECHESTVEN FRONT, published a few days ago.

OTECHESTVEN FRONT features a reportage on the "Filipov case" (About Svezha and Mikhail Filipov who left Bulgaria illegally in 1983 and deserted their children.

The two girls are aged seven and five. Mikhaela, the older of the two, is suffering from serious valvular defect of the heart and is mentally and physically underdeveloped. The children are living under good conditions with the grandparents (on their mother's side) Yordanka and Zhecho Dachev, in the town of Novi Pazar, for the last three years, and Mr Filipov has [as received] not extended any financial support to their children. "Thus, I have serious doubts whether the sending of the children abroad will be in their best interest," Justice Khristo Dimitrov, president of the Novi Pazar regional court, told the OTECHESTVEN FRONT reporter. In response to a request by the grandparents (Yordanka and Zhecho Dachev), Justice Khristo Dimitrov has issued a document giving the gransparents the status of the children's guardians.

"I believe their request legitimate and issued a document to that effect," said the judge. "The last section of Article 16 of the code of civil procedure allows the carrying out of such a procedure in cases where there is a conflict between the interests of the children and their parents. Who else could be the children's guardian but their grandparents, all the more that the children are living in their home and that the grandparents have undertaken the children's support (while their parents have practically deserted them at an age when the children were and still are practically helpless.")

The author of the article, Ms Rumyana Bratovanova, views the case as a conflict between the Dachevs and the Filipovs, a conflict between two generations of parents and between two different notions of the rights and responsibilities of parents in respect to their offspring.

The grandmother Mrs Yordanka Dacheva has the following to say: "The Bulgarian authorities have said that they would allow the children to join their parents. But even if the authorities are giving the children, I am not. Can I let these small children go to immigration camps? Can I be sure that someone is not coaching the parents and is not going to use the children in blackmailing my daughter and son-in-law? Why does Svezha want two of her children only? What about the other two, the older ones? Svezha must come back, there are four children waiting for her here.

Indeed, Svezha Filipova does not [word indistinct] other daughters from her first marriage, who are living with their father in the city of Ruse. Mikhail Filipovalso has a son from his first marriage who is living with his mother. At the time of their departure from Bulgaria, the Filipovs were still 5,500 leva behind in their payment of a state-granted loan. This money was paid by Svezha's parents, who are also looking after Mikhails' mother Mariya, 85 years old.

Justice Khristo Dimitrov: "I just can't imagine such a negligence on the part of parents. Children can't be looked after from such a distance. You can't be a loving mother while deliberately staying away from your children. And suddenly, years later, the Filipovs started pressing the Dachevs to regain custody over their children through public displays, cars.... There is obviously someone behind the Filipovs and it is not difficult to guess who. The influence of the anti-Bulgarian propaganda has awakened rather late their parental feelings."

And so the Dachevs refused to let the two girls go. The officials in Novi Pazar have offered their assistance to Filipovs' representative, Prof Piasavitzky, a U.S. citizen, who arrived in Bulgaria. The Dachev's were caterorical: They refused to send the children and Mikhail's 85 year old mother in the company of a total stranger who was on top of all unable to communicate with them as he did not speak Bulgarian. Besides, seven year old Mikhaela and her bigger [as received] sister Mariya, need constant care.

Mr Marin Mikhov, chairman of Novi Pazar's city council: "We have assisted the representative of the Filipovs but we cannot go against the elderly people's strong desire to educate the children in a Bulgarian spirit. The children are receiving the necessary material support: The household lives on two retirement pensions, a salary (Dachev, who is already retired, is still working) [as received] and a monthly allowance from the council. I think that this is before all a family argument. Such conflicts happen in other families as well, especially in view of the traditionally strong bonds between grandparents and grandchildren in this country."

"I find it difficult to reproach the mother," writes the journalist from OTECHESTVEN FRONT. But it is very difficult for me to believe what I see: What mother would leave her child, sick and helpless, in the hands of her aging parents? Can one forget and postpone maternity in the search for happiness and success? Now, in their statements before foreign anti-Bulgarian oriented radio stations, Svezha Filipov and Mikhail Filipov are saying that they have left Bulgaria but not their children. They said that they had wanted to play parts in movies and drama but their talents have not been recognized."

"I wonder whether they believe their own words," writes Mr Rumyana Bratanova. Children need constant care and attention. No one has disputed the Filipovs' right to happiness in this country."

"This is the story and we can discuss, at length, each character's understanding of his own rights and responsibilities. Although Svezha and Mikhail Filipov claim a good understanding of literature, they probably do not feel like taking part in a discussion like this. They are obviously under the impression that some people have rights only, while others, only obligations, and that they, of course, belong to the former group," states the author of the OTECHESTVEN FRONT article.

JEWISH ORGANIZATION REJECTS TURKISH 'CAMPAIGN'

AU191904 Sofia BTA in English 1535 GMT 19 Feb 86

[Text] Sofia, 19 February (BTA)--"In Bulgaria there are no persecutions of and encroachments for religious and ethnical reasons upon any Bulgarian nationals whatsoever--such persecutions are incompatible with the principles and the essence of socialist humanism, with Bulgaria's legislation. We Bulgarian citizens enjoy freedom and equal rights in our work, we form a united brotherly family: Bulgarians, Armenians, Jews, Atheists, Orthodox Christians, Moslems and Israelites [as received]--regardless of sex, race, religious beliefs--in conformity with the constitution of our socialist homeland."

This statement is part of a declaration adopted by the plenary session of the central leadership of the public Cultural and Educational Organization of the Jews in Bulgaria. The declaration resolutely rejects the hostile campaign against Bulgaria launched by nationalistic and chauvinistic elements in Turkey with groundless accusations prompted by self-seeking aims.

The declaration stresses that there were persecutions and encroachments for religious purposes in Bulgaria during fascism. Such an antisemitic legislation separated the Jews from the other part of the people, suppressed and limited their rights and freedoms and prepared their genocide in the Nazi death camps. "We raise our voices to declare the historic truth that we, the Bulgarian Jews, were saved from mass annihilation thanks to the democratism and tolerance of the Bulgarian people and thanks to its courageous struggle to free itself from the paws of the Nazi plague", the document points out. It also stresses that Mr Todor Zhivkov, now Bulgaria's State Council president, took an active part and made his personal contribution to this struggle organized and led by the BCP.

"We, the Bulgarian Jews, have our own public, cultural, and educational organization, which has its own publication--the EVREYSKI VESTI newspaper, its own 'Year Book' and its own permanent exhibition 'The Rescue of the Bulgarian Jews in the 1941-1944 Period'. [words indistinct] cultural and educational work," the participants in the plenary session said. They stress that in spite of the fact that there are very few people in Bulgaria professing the Israelite religion, in this country there is a central Israelite spiritual council which is entirely subsidized by the state. The central synagogue in Sofia not only operates but has also been [words indistinct] restored with state means. These are facts that clearly show that in Bulgaria all ethnical groups are free and equal and that Bulgaria's government is categorically against assimilation by force. "The issue of the names of any Bulgarian nationals and of their religious beliefs is a personal one, a personal right guaranteed by the Bulgarian legislation," the declaration points out.

The participants in the plenary session of the Jewish Cultural and Educational Organization declare that "the activities of the [word indistinct] disposed to Bulgaria Turkish circles, in which unfortunately the Turkish Government headed by Mr Turgut Ozal takes part, are in the interest of those who are against goodneighbourliness and mutually advantageous cooperation." At the same time the participants in the plenary session expressed support to the 9 February declaration of the BTA, which sets forth the stand of the Bulgarian side for continuing the efforts for'the promotion of the equitable and mutually advantageous relations between Bulgaria and Turkey and against all attempts to interfere in the home affairs of the sovereign Bulgarian state and its citizens.

BULGARIAN-SOVIET FRIENDSHIP SOCIETY MEETING HELD

AU180933 Sofia RABOTNICHESKO DELO in Bulgarian 13 Feb 86 p 6

[Excerpts] The activities of the Bulgarian-Soviet Friendship All-National Committee and of the Bulgarian-Soviet Friendship Committees in 1985 and the forthcoming tasks of these organizations were discussed at a plenum of the All-National Committee held yesterday. Georgi Atanasov, candidate member of the BCP Central Committee Politburo and secretary of the BCP Central Committee attended the plenum. Leonid Grekov, USSR ambassador was also among those present.

In evaluating the successes, ideological-educational work, and cultural-mass work of the Bulgarian-Soviet Friendship All-National Committee, the plenum devoted attention to the fact that this work is not yet sufficiently purpose-oriented and that it is not adequate to the standards of the mutual relations existing between the USSR and the People's Republic of Bulgaria. The level of certain initiatives and events is not satisfactory.

The participants expressed themselves in favor of closer cooperation with other organs and organizations in the propagation and use of Soviet experience and in connection with developing the patronage movement, as well as international competition, which will contribute to the implementation of the decisions adopted at the BCP Central Committee February plenum.

Nacho Papazov, chairman of the Bulgarian-Soviet Friendship All-National Committee, delivered a closing speech at the plenum.

BALEV ATTENDS PRESENTATION OF GORBACHEV BOOK

AU221707 Sofia Domestic Service in Bulgarian 1830 GMT 21 Feb 86

[Text] A festive meeting was held at the Soviet Embassy in Sofia on the occasion of the presentation of the new edition of Comrade Mikhail Gorbachev's book, entitled "Along the Leninist Path."

In his speech Comrade Milko Balev pointed out that the second edition of the book, completed by new works, is a great event for the Bulgarian party, state, economic, social, and leading cadres and for the ideological workers in Bulgaria and all Bulgarian citizens. In recalling that this book was published on the eve of the 27th CPSU Congress, Comrade Milko Balev expressed his conviction that this will not be an ordinary congress, but a turning point in the development of the Soviet country.

On behalf of the BCP Central Committee and on behalf of the Bulgarian PARTIZDAT, which published the book, Comrade Milko Balev presented to Leonid Grekov, USSR ambassador extraordinary and plenipotentiary to Bulgaria, a presentation copy of the book "Along the Leninist Path."

In accepting this new edition the Soviet ambassador pointed out that the book reveals the contemporary policy of the CPSU in all its character based on principle, in all its complexity and variety, and that the book reveals the party's innovative research and its striving to establish a link between the concern about the fate of socialism and the concern for the fate of civilization worldwide, as well as the striving to ensure the peaceful future of mankind.

MINISTER KHRISTOV ON TRADE RELATIONS WITH USSR

AU250921 Sofia BTA in English 1244 GMT 24 Feb 86

[Text] Sofia, 24 February (BTA)--"An extended system for trade and economic cooperation between Bulgaria and the Soviet Union is functioning today," marks [as received] Mr Khristo Khristov, minister of trade of Bulgaria, in RABOTNICHESKO DELO. During the last three decades the bilateral barter has marked explicitly dynamic growth, its structure and forms have been qualitatively enriched.

In 1956, the mutual barter amounted to 228 million roubles. In 1970 it has already reached 1.8 billion roubles. The next 15 years have marked even higher rates of growth, as well as ever deeper qualitative changes. During 1971-1975 the exchange of merchandise have amounted to 13.5 billion roubles, in 1976-1980, to 29.2 billion roubles, and in the past eighth five year period the barter has reached 51.7 billion roubles.

Pointing out this data Mr Khristo Khristov stresses the progressive changes, which have set in the structure of barter, above all in the sector of machines, equipment and computer technology. Their share in Bulgaria's export has grown at accelerated rates and in 1985 it has reached 60 percent. Bulgaria has consolidated its position as a trustworthy and long-term supplier of a number of basic types of metal working machines, hoisting and hauling devices and other mechanical engineering products, of a wide range of computer technology and products, as well as of a considerable volume of consumer goods--foods, chemistry and pharmaceutical products, light industry products and others.

At the same time the Soviet equipment and technology deliveries have shaped the outlines of the basic branches of Bulgarian economy. Bulgarian trade minister emphasises the great importance for the economy of this country of the Soviet deliveries of fuel, raw materials and consumer goods.

In the process of carrying out the long-term programme, the most efficient directions, forms and conditions for the further mutually advantageous and balanced development of the trade and economic cooperation have been determined through coordination of the new five year plans and the long-term trade agreement for the 1986-1990 period, which has been concluded in January, this year, stresses Minister Khristo Khristov. The new agreement envisages the barter between the two countries for the new five-year period to amount to

70 billion roubles. It is characterized by the fact that the exchange in the scientific and technologically intensive branches will grow at highest rates--electronics, computerized manufacturing systems, robotics, nuclear equipment, biotechnologies, etc. The establishing of joint economic enterprises with integrated managing bodies will make possible the joint development and mastering of the latest achievements of techno-scientific advance. The author of the article points as an example [as received] the three joint enterprises that have been established--for robotics, for processing numerically controlled machines, and for electronic devices for the automative industry.

FURTHER SNOWFALL, HIGH WINDS INTERRUPT OKRUG SERVICES

[Editorial Report] Sofia ROBOTNICHESKO DELO in Bulgarian on 13 February 1986 carries on page 2 three brief unattributed reports, totalling approximately 450 words, from Kurdzhali, Stara Zagora, and Russ Okrugs on interruptions to services caused by snowfall and high winds. The Kurdzhali report states that, due to heavy snowfall with high winds, "once more there have been interruptions of the electricity and telephone lines, as a result of which 7 villages have been left without electric power and a further 22 populated settlements without telephone links. For the same reason 5 pumping stations have been put out of action, resulting in 17 populated settlements remaining without drinking water." Round-the-clock duty teams have been set up "to guarantee normal road communictions."

The Stara Zagora report states that "as a result of round-the-clock work by emergency teams, "working on the elimination of faults in the electric power supply to populated settlements, of the 177 villages in the Okrug affected, 123 have had their electricity and water supplies restored." It is reported that fresh snowfall has hindered road clearing activities, but the main roads and most of those between villages have been cleared.

Fresh, heavy snow is also reported from Ruse Okrug: "snowdrifts and banks, as well as reduced visibility due to falling snow, were the reason for the roads in the Okrug to be closed to cars and trucks with trailers." It is stated that special teams are engaged in clearing the roads, and duty teams have been formed to restore interruptions in services. It is reported that "measures have been taken to supply the population with all necessary products and goods."

CHILDREN REUNITE WITH PARENTS--(ANSA) Rome, 17 February--Two Italian Radical Party members flew to Sofia today to pick up two Bulgarian girls and their grandmother and bring them back to Italy to be reunited with their parents. The Bulgarian Embassy issued visas to Antonio Stango and Gino del Gatto, two Radical Party spokesmen who have taken the Filipov case to heart, [words indistinct] demonstration was restaged on behalf of the family outside the embassy's premises. Mikhail and Svezha Filipov started a hunger strike thirteen days ago to call attention to their plight and their demand to have their daughters and Mr Filipov's mother join them in Italy. Before issuing the visas, however, the Bulgarian Embassy released a statement blaming Mr and Mrs Filipov as the only ones responsible for their separation from their daughters. The couple, according to the embassy, had "categorically" refused to travel to Sofia themselves to pick up the children even though Bulgarian authorities had provided full assurances that the whole family would be allowed to reemigrate to Italy. AFRO-ASIAN COMMITTEE DENOUNCES PAKISTAN--Sofia, 14 February (BTA)--The Afro-Asian Peoples' Solidarity Committee has issued a declaration voicing deep concern on behalf of the Bulgarian public over the brutal retribution of the Pakistani authorities against the Afrids, the Shinwars and other freedom-loving Pashtoon tribes. These tribes have taken a resolute stand against the turning of their lands into a springboard for the training and sending into Afghan territory of counterrevolutionary gangs on terrorist missions aimed to undermine the achievements of the April revolution. The pashtoon position, the declaration says is a contribution to the efforts towards normalizing the situation and establishing order and understanding in that part of the world. It is for this reason that it had angered the Pakistani military who have committed themselves to an undeclared war on the Democratic Republic of Afghanistan. The Afro-Asian People's Solidarity Committee resolutely condemns the actions of the Pakistani military and urges an immediate end to them. It expresses unreserved support for the struggle of the Pashtoon tribes for free and peaceful life. FILIPOV ATTENDS MEETING--On 16 February a joint session of the Burgas Okrug People's Council and the Okrug Council of the Bulgarian Trade Union took place. Comrade Grisha Filipov and Nikolay Zhishev, first secretary of the BCP Burgas Okrug Committee, took part in the session. The plan implementation during 1985 as well as the new counterplan on the Okrug's scientific-technological and socio-economic development of the Okrug and the 1986 Okrug budget were discussed. It was stressed that last year successfully ended the Eighth 5-Year Plan. The Okrug began the practical implementation of the decisions of the BCP Central Committee February Plenum as a basis of the further intense development of the Okrug's economy. Some 869 scientific-technological projects have been introduced. A profit of over 43 million leva has been obtained. Some 3,500 apartments and many other social-consumer and cultural objects have been constructed. [Text] [Sofia Domestic Service in Bulgarian 1000 GMT 15 Feb 86 AU] /12913

MLADENOV ATTENDS KUWAITI RECEPTION--"This evening the ambassador extraordinary and plenipotentiary of Kuwait to Bulgaria gave a reception in the "Vitosha New Otani" Hotel on the occasion of his country's national day. BRIEFS

ACADEMY OF SOCIAL SCIENCES MEETING--The Senate and Executive Board of the Academy of Social Sciences met on 5 February 1986. Previous activities were discussed as well as the academy's tasks in the upcoming period, with particular consideration given to the preparation for the 10th party congress. Central Committee Secretary Professor Henryk Bednarski thanked the current academy rector, candidate Politburo member Professor Marian Orzechowski, for his contribution to the creation, organization, and administration of the academy. Bednarski also briefed the participants on decisions of the Politburo, ratified by the 24th Plenum of the PZPR CC, resulting in the appointment of Professor Jarema Maciszewski as rector of the academy and of Professor Bronislaw Ratus as deputy rector. Wladyslaw Honkisz, director of the Personnel Policy Department of the PZPR CC, also participated in the meeting. [Text] [Warsaw TRYBUNA LUDU in Polish 6 Feb 86 p 2] /6091

PZPR PERSONNEL POLICY PROBLEMS--Personnel policy department directors of the provincial committees met in conference in the Party Training Center of the PZPR CC in Warsaw. The meeting was called to discuss the problems affecting the implementation of party personnel policy. The participants reviewed the record of accomplishment in complying with the provisions set forth in the document "Underlying Premises of PZPR Personnel Policy," they exchanged views on lessons learned in this regard at the provincial party level, and identified tasks which need to be dealt with in the period leading up to the 10th party congress. Particular attention was paid to the role, significance, and responsibility of senior party personnel in the process of the nation's socioeconomic development. The meeting was chaired by Wladyslaw Honkisz, director of the PZPR CC Personnel Policy Department. [Text] [Warsaw TRYBUNA LUDU in Polish 6 Feb 86 p 2] /6091

PRODUCTION PLEDGES FOR 10TH CONGRESS--The work crews of the Lenin Shipyards in Gdansk, on the initiative of the factory party organization, have agreed to observe the upcoming congresses of the fraternal parties (the CPSU 27th Congress and the PZPR 10th Congress) with production pledges. With the passing of this resolution, the socio-political shipyard aktiv, during its inaugural meeting at the largest factory of the Polish shipbuilding industry, launched the pre-10th congress campaign. At the same time, the Gdansk shipyard workers appealed to the crews of production factories named after distinguished leaders of the international workers movement, and to the workers in factories involved in joint efforts with the shipbuilding industry, to launch similar initiatives. At the invitation of the shipyard workers, Stanislaw Bejger, Politburo candidate member and first secretary of the Gdansk PZPR Provincial Committee, and Iwan Tkaczenko, Soviet consul general in Gdansk, participated in the proceedings. FILM INDUSTRY ISSUES DISCUSSED--The minister of art and culture, Kazimierz Zygulski, met with the Presidium of the Executive Administration of the Polish Film Association on 6 February 1986. At this meeting they appraised the current status of the film industry and also discussed the most important issues of concern to the industry. [Text] [Warsaw TRYBUNA LUDU in Polish 7 Feb 86 p 2] /6091

PARTY DRAFT PROGRAM DISCUSSION--On 5-6 February 1986 the PZPR CC Ideological Department conducted a seminar devoted to the draft of the Party Program. CC lecturers took part as well as seminar-leaders from the provincial committees. In their meetings with the commission members engaged in formulating the draft, they discussed the draft's fundamental contents as well as its methodological foundations. [Text] [Warsaw TRYBUNA LUDU in Polish 7 Feb 86 p 2] /6091

CULTURAL-SCIENTIFIC CONTACTS WITH ALGERIA--Algiers (PAP)--A program between the governments of Poland and Algeria implementing cultural and scientific agreements for the period 1986-88 was signed here on 5 February 1986. The program defines the direction of future cooperation in the areas of science, culture, and education. It refers to an exchange of cultural performances, a strengthening of academic contacts, and increased development of scientific exchanges. [Text] [Warsaw TRYBUNA LUDU in Polish 7 Feb 86 p 7] /6091

CULTURAL AGREEMENT WITH VIETNAM--Hanoi (PAP)--PAP correspondent Stanislaw Grzymski writes that Deputy Minister of Foreign Affairs Jan Majewski visited Vietnam from 5 to 7 February 1986. He held talks with Deputy Minister of Foreign Affairs Hoang Bich Son, and he was received by Deputy Premier Vo Nguyen Giap and also by Minister of Foreign Affairs Nguyen Co Thach. The subject of the talks was the issue of Polish-Vietnamese relations, characterized by a strong development and intensification of cooperation in several areas. The further development of this cooperation was indicated during the course of these discussions. Deputy Ministers Jan Majewski and Hoang Bich Son signed an agreement promoting cultural and scientific exchanges between Poland and Vietnam for the period 1986 to 1990. PZPR SECRETARY VISITS COTTON MILL--Jan Glowczyk, Politburo candidate member and PZPR CC secretary, visited the largest cotton manufacturing plant in Poland, the J. Marchlewski Cotton Mill in Lodz. There he met with the political-economic aktiv, the workers' council, representatives of the trade unions, and the Factory Administration of the Union of Socialist Polish Youth.

The main topics of the meeting were the participation of party members and candidates in discussions leading up to the 10th party congress and the ways in which they can be made more socio-politically involved. [Text] [Warsaw ZYCIE WARSZAWY in Polish 7 Feb 86 p 2] /6091

WARSAW DELEGATION IN MOSCOW--Moscow (PAP)--PAP correspondent Slawomir Popowski writes that a delegation of Warsaw party and local government authorities has completed a 2-day visit to Moscow. This delegation included Janusz Kubasiewicz, first secretary of the PZPR Provincial Committee, Mieczyslaw Debicki, mayor of Warsaw, as well as Mieczyslaw Szostek, chairman of the Warsaw People's Council. On Wednesday [5 February 1986] they met with representatives of Moscow's party and local administration, including Boris Yeltsin, secretary of the CPSU CC and secretary of the Moscow City Committee. Also present was Valeriy Saikin, chairman of the Executive Board of the Moscow City Committee. One of the topics of discussion centered around preparations in both capitals for their respective party congresses. In addition, the course of development of future cooperation between Moscow and Warsaw was agreed upon. [Text] [Warsaw RZECZPOSPOLITA in Polish 7 Feb 86 p 9] /6091

POPE SENDS HOSPITAL GIFT--The Plock Voivodship Hospital Center reveived a gift from Pope John Paul II of modern diagnostic equipment. The gift, a "Soline" ultrasonograph made by the Siemens company, is used for non-invasive examination of certain internal organs, e.g. the liver, kidneys, and pancreas. Bishop Zygmunt Kaminski, the apostolic administrator of the Plock diocese, gave the equipment to the director of the hospital in the Pope's name on 3 January. Last month the Plock Voivodship Hospital received an infant gastrofiberscope as a gift from the Polish Primate. [Text] [Warsaw PRZEGLAD KATOLICKI in Polish No 6, 9 Feb 86 p 4] /12913

POLISH NATIONAL CATHOLIC CHURCH ACTIVITY--Kazimierz Morawski, member of the Council of State and ChSS [Christian Social Association] president, met with Tadeusz Ryszard Majewski, head of the Synodic Council and bishop of the Polish National Catholic Church. They discussed questions concerning the activity of Polish Christians in the areas of ecumenism, peace and socio-civic action. They stressed the importance of tolerance and of principles which express respect for differing beliefs and attitudes in social and religious life as permanent and irreversible values in strengthening national understanding and civic cooperation. The head of the Polish National Catholic Church in Poland reported on the activities of the church with particular view to the extensive donations of medical equipment made abroad to hospitals in Poland. [Text] [Warsaw ZYCIE WARSZAWY in Polish 8-9 Feb 86 p 2] /12913

PZPR PERSONNEL POLICY TALKS--A conference of personnel and education department directors from ministries and central offices and headquarters of cooperative unions was held at the Party Training Center of the PZPR CC in Warsaw. The participants evaluated progress made toward implementing the provisions set forth in "Underlying Premises of PZPR Personnel Policy." They also specified recommendations and tasks aimed at making current programs work more efficiently. Reference was made to the need to encourage senior party personnel to play a more aggressive role in the area of economic affairs. The responsibilities of senior party personnel in the struggle against symptoms of social pathology were underscored, as was their special role in activities geared toward the moral renewal of society. The meetings were chaired by Wladyslaw Honkisz, director of the PZPR CC Personnel Policy Department. [Text] [Warsaw TRYBUNA LUDU in Polish 8-9 Feb 86 p 2] /12913

OPOLE PARTY AKTIVS MEET--Party and social aktivs met at the provincial party headquarters in Opole to discuss and identify ways to combat pathological symptoms and negative phenomena in Polish life. Jozef Baryla, Secretary of the CC PZPR, provided the discussion summation. [Text] [Warsaw ZYCIE WARSZAWY in Polish 8-9 Feb 86 p 2] /12913

METALWORKING PLANT HOSTS MEETING--The socio-political aktiv at the H. Cegielski metal-working plant in Poznan received a briefing on the course and types of preparations for the 10th Party Congress, as well as a work schedule for the upcoming months. New party members received their membership cards during the course of the meeting, which was also attended by Stanislaw Kalkus, PZPR CC Politburo member and worker at the H. Cegielski plant. 'IRREDENTIST' SENTENCED FOR DEMONSTRATING IN SWITZERLAND

LD271651 Belgrade TANJUG Domestic Service in Serbo-Croatian 1542 GMT 27 Feb 86

["Irredentist Sentenced"--TANJUG headline]

[Text] Vranje, 27 Feb (TANJUG)--The grand criminal tribunal of the District Court in Vranje, presided over by Ekrem Islami, has sentenced Farik Junuzi (37) from the village of Breznica near Bujanovac [in southern Serbia] to 5 years' imprisonment for taking part in demonstration by greater Albanian extremist emigres in Geneva and Zurich. By taking part in the demonstrations in these Swiss towns, Faik Junuzi committed the criminal act of posing a counterrevolutionary threat to the sociopolitical system of the SFRY, which is punishable under the criminal law of the SFRY.

According to the indictment and the admission of the accused in court, Faik Junuzi took part in the demonstrations in Geneva and Zurich in 1981. On these occasions he carried a banner on which was written "Kosovo Republic." Other banners read "Stop the terror in Kosovo" and "Down with Yugoslav fascism." According to Junuzi's admission, the demonstrations lasted for more than an hour.

In the same year, Faik Junuzi and a group of greater Albanian extremist emigres and irredentists attempted to take part in similar demonstrations in Bonn, but were prevented from doing so by the police.

When he returned home from abroad some time ago, Faik Junuzi was placed in detention.

The investigative organs found an album of photographs and several cassettes of songs containing hostile content in his home.

SERB IN EXILE BELIEVED KIDNAPPED IN VIENNA

AU242143 Vienna DIE PRESSE in German 22-23 Feb 86 p 16

[Special DIE PRESSE report by "ST"]

[Text] Vienna--At the beginning of this week a Serb living in exile in Vienna has disappeared in Vienna under mysterious circumstances. Friends and relatives fear that he might have been kidnapped. State Security police have launched an investigation; reportedly they have not discovered any proof to date.

The man who disappeared is 68-year-old Johan Caricic from Vienna-Donaustadt, a Serb by birth who was sentenced to death in Yugoslavia after the war as a former officer of the Serbian Army. After he was pardoned, he spent 10 years in jail in Yugoslavia before he came to Austria in the late 1950's.

Until recently he ran a forwarding business in Austria, but in addition he has played an active role in the movement of Serbs in exile. Among other things, he was president of the Serbian-Orthodox Church community in Vienna, and worked until recently for foreign exile newspapers.

Caricic has repeatedly received anonomous threats, warning him to "keep quiet" and to stop his political activities, but he refused to let himself be intimidated. In 1981 he was brutally beaten up in the yard of his apartment house in Hans-Steger Gasse in Vienna, and was seriously injured.

Since last Monday [17 February] the Serb has been missing. In the afternoon he told his family that he was going to the tobacco shop, and did not reappear. While a police spokesman declared that Caricic had disappeared without leaving a trace, his relatives believe that the 68-year-old man was kidnapped, and that the Yugoslav secret service is behind it.

DAILIES DIFFER IN REPORTING JONANOVIC SPEECH

AU070851 [Editorial Report] Belgrade BORBA in Serbo-Croatian on 1-2 February on page 6, Belgrade POLITIKA in Serbo-Croatian on 1 February on pages 5-6, and Pristina RILINDJA in Albanian on 1 February on pages 1 and 5-6 carry reports on the discussion of the emigration of Serbs and Montenegrins from Kosovo held in the Federal Chamber of the SFRY Assembly on 31 January, providing varied reports on the speech of Batric Jovanovic, delegate from Montenegro.

In a 600-word report on Batric Jovanovic's spech, BORBA states that:

"According to a report in KNJIZEVNE NOVINE of 15 January 1986, a gathering of about 400 veterans of Kosovo-Metohija partisan brigades who live in Belgrade was held in Belgrade on 12 December 1985. The president of the Provincial Committee of the LC of Kosovo [Kolj Siroka] and representatives of the Veterans Federation of Serbia, Kosovo, and Belgrade also attended. The following resolution was passed by acclamation: 'The veterans assess that the process of differentiation among the most reponsible cadres of Albanian nationality has not even started, despite the LCY Central Committee Platform on Kosovo. The Assembly of the Socialist Autonomous Province of Kosovo is called upon to insist on the legal responsibility of persons guilty of violating the constitutional rights of Serbs and Montenegrins.' Batric Jovanovic then recalled that several prominent Kosovo-Metohija communists, such as the Jovo Sotra, Kadri Reufi, and Milos Sekulovic, offered resistance to the anti-Yugoslav and Great Albanian policy of a part of the former Kosovo leadership. Therefore, they were unjustly disqualified morally and politically, but they have not been rehabilitated to this day. What is more, the people who are most responsible for beating down the said communists continue to be high officials, and therefore it is necessary to include in the conclusions a provision that the Federal Chamber believes that it is necessary to rehabilitate most urgently the persons who were victims of the former Kosovo leadership."

POLITIKA in its 400-word report on Batric Jovanovic's speech, renders this passage as follows:

"Having mentioned a recent gathering in Belgrade attended by 400 veterans from Kosovo at which it was requested that Fadilj Hodza be held responsible for the escalation of Albanian chauvinism, Jovanovic proposed that the conclusions should incorporate a provision according to which the chief perpetrators in this situation in Kosomo should be called to account, and the sanctions against indoctrinated youths should be mitigated.

"According to him, one of the conclusions should be that the Kosovo assembly should annul the stands of the Bujan conference held at the end of 1943 and the beginning of 1944. This conference is now celebrated in Kosovo, but not the reunification of Kosovo and Serbia. He also proposed that in order to strengthen equality, a chamber of peoples and nationalities be introduced in all assemblies where there are several nationalities."

RILINDJA in a 500-word report on the speech of Batric Jovanovic, reports this section of his speech as follows:

"Continuing, Jonanovic, reports this section of his speech as follows:

"Continuing, Jovanovic said that the veterans of the Belgrade meeting observed that there are still some individuals in the provincial leadership who had connections with, or maintained positions of, Albanian irredentism and separatism. For this reason he proposed that there be incorporated in the conclusions of the meeting the point that 'it is necessary to hold legally and politically responsible the chief perpetrators of the mistaken policy in Kosovo up to 1981, and substantially to reduce the pressure of sanctions against indoctrinated young people.'"

RILINDJA reports that Jovanovic also commented upon the anomaly that the flag of the People's Socialist Republic of Albania was permitted to be used by Albanians in Kosovo, and further notes: "In this context, Jovanovic introduced the equality of languages and alphabets, and demanded that the cyrillic alphabet in Kosovo, as is proper, as the alphabet of the Serbs and Montenegrins, should earn the treatment it deserves. Finally he proposed that this chamber should consider the situation every two months in connection with the emigration of Serbs and Montenegrins from Kosovo."

FADILJ HODZA NAMED AS RESPONSIBLE FOR KOSOVO IRREDENTISM

AU012056 [Editorial Report] Belgrade Domestic Service in Serbo-Croatian at 1800 GMT on 31 January carries a 5-minute report on the 31 January discussion in the SFRY Assembly Federal Chamber on emigration from Kosovo.

The Belgrade Radio report refers to the morning speech by Batric Jovanovic, "which provoked Aslan Fazlija's reaction in the afternoon. Among other things, Batric Jovanovic quoted the conclusions of the gathering of 400 Kosovo veterans who live in Belgrade. It is said in these conclusions that Fadilj Hodza bears the greatest responsibility for the irredentist escalation in Kosovo. He therefore proposed that the main culprits for the erroneous policy be called to political and criminal responsibility.

"Aslan Fazlija said that one cannot bypass the League of Communists, and he stressed that the veterans include some who do not agree with the party. Fazlija rejected Batric's thesis about the need to rehabilitate the persons who pointed out errors, saying that this, too, is a matter for the League of Communists. Fazlija also disputed Jovanovic's characterization of the Bujane conference and said that it has no connection with emigration and that no official organ has rejected this conference. Fazlija in conclusion proposed that the Federal Chamber should dissociate itself from Batric Jovanovic's proposal."

DRAGOSAVAC, BILIC DIFFER ABOUT LC DEFINITION

AU082055 Belgrade BORBA in Serbo-Croatian 5 Feb 86 p 2

[Seada Vranic article: "Does Unity Obstruct Unity?"]

[Excerpts] The reservation expressed at the latest session of the Central Committee of the LC of Croatia by Marko Lolic, member of the LCY Central Committee, referring to the definition of the LC of Croatia as an "independent and unified organization in a unified LCY" considerably contributed to an atmosphere of a very critical and frank discussion about the amendments to the Statute of the LC of Croatia. Lolic resented that this definition shifts the stress from LCY unity--which was particularly insisted upon by the public discussion of the draft conclusions of the 13th LCY Central Committee session--to independence, which in essence leads to a federalization of the LC.

Nine Questions Or --.

An even more explicit doubt as regards the said definition was expressed by Dusan Dragosavac, member of the LCY Central Committee Presidium, who said that this formula in fact legalizes nine Leagues of Communists, which would not only be unified but also independent. Such a formula (which is proposed both for the LCY Statute and for the statues of the republican and provincial LC organizations) cannot withstand serious Marxist criticism, and is not in conformity with the basic premises of the Croatian LC Program. It tends to some extent to identify the party and the state, pushing the LC into the state and the nation.

In the modern world, particularly in societies as ours, the question of the right of a nation to self-determination and to secession is constantly being posed. At the same time, the struggle for the other thing, for unity, is also strongly pronounced. One stresses not only autonomy but at the same time also interdependence. Unity, one knows, may be realized exclusively on equality.

Specifically in the LC, Dragosavac added, unity is being realized on the basis of its program and the unified statute foundations which, however, offer sufficient scope for initiative that should not be an obstacle to unity but should enrich our practice.

Jure Bilic, member of the LCY Central Committee Presidium, also referred to this question in his speech. He recalled that the LCY Statute previously contained the wording that the LC's of the republics and provinces unite in the LCY. It is a historical fact, Bilic said, that a unified party was set up in 1919, but in 1937 we began creating national parties. Therefore, the present LCY unity is not the unity that existed in 1919, but unity which incorporates independent organizations in the republics and provinces. Particularly since the 1974 Constitution, we have gone further in the elaboration of the concept of unity and independence, and this especially relates to the provinces.

...Eight Parts of a Whole

The wording which has been arrived at, according to Bilic, has not come about only under the pressure of the leadership of the LC of Serbia for unity within the LC of that republic, or under the pressure of unclarified relations between the LC of this republic and the party leaderships in the provinces. The starting point, in fact, was that unity must exist in the basic organizations and also in the communal, provincial, and republican organizations, as well as in the LCY, on the basis of the LCY program and policy.

It is a moot point, after all, Bilic said, whether this is federalism; however, the intention was not federalization, but unity as regards the adoption and the implementation of policy. There can be no unity in the LCY if there is disunity in the LC of Croatia or if the relations within the LC of Serbia are disputed.

The different views which this time were manifested about the definition of the republican and provincial LC organizations should not be regarded in advance as something that should not happen in the LC. Even the fact that differences were manifested among the members of the same--in this case the highest--party leadership should not be regarded negatively. It is true, however, that much public criticism has recently been addressed at the disunity in the leaderships, which undoubtedly has wide repercussions on the relations and the situation in the LC. In his time even Mitja Ribicic, when he was president of the LCY Central Committee Presidium, publicly cited this organ and spoke very critically about the disunity manifested immediately after the 12th LCY Congress which could have dire consequences.

As regards the concrete wording, we believe that it is good that the question of relations in the LCY should be thoroughly discussed until the party congresses and that all the arguments be voiced publicly and loudly. Even the fact that the abovementioned definition of the republican and provincial organizations of the LC is backed by two commissions, and even by the LCY Central Committee Presidium, should not prevent opposite views from being expressed, particularly since the discussion will run up to the 13th congress and what is at stake is probably the most sensitive question in the LCY. It is sensitive because the warnings about the deeper and deeper penetration of federalism in the LCY are not overblown.

POLITICS YUGOSLAVIA

HASANI BOOK ON KOSOVO PUBLISHED

LD242117 Belgrade TANJUG Domestic Service in Serbo-Croatian 1655 GMT 24 Feb 86

[Summary] Belgrade, 24 Feb (TANJUG)--At the international press center in Belgrade a book by Sinan Hasani, the well-known author and vice president of the SFRY Presidency, entitled "Kosovo, Istina i Zablude" [Kosovo, the Truth and Misconceptions] was launched. The book is published by the Zagreb Center for Information and Publicity and was reviewed by Koca Joncic, Dusan Bilandzic and Rahman Dedaj. According to Koca Joncic, the author of the book addressed himself mainly to the theme of intranational relations in Kosovo in a very objective, critical and Marxist way, assessing, with poignancy and objectivity, above all the situation in his own nation, greater Albanian nationalism and irredentism. Sinan Hasani has reviewed with particular success the variegated mosaic of hostile organizations, their exponents and aims, the forms of their activity and their historic destiny.

"'My main objective in writing the book was to use the counterrevolutionary events in Kosovo to draw attention of socio-political organizations in Kosovo and further afield to the need for investing even more efforts in promoting and consolidating the fundamental achievements of our revolution,' Sinan Hasani said.

"Hasani went on to stress that, except centers connected with Albania and hostile emigres, the research so far had failed to uncover a common center of the enemy's activity in Kosovo itself. If this is the case, he added, then there is no room for some well-meaning people's belief that the centers must be inside the country. It is unacceptable, malicious and unnecessary to insist on such an attitude and to seek the enemy's leaders among the leading personalities of Albanian nationality in the LCY. It is not impossible that somebody from the enemy's camp finds its way into the League of Communists; it is, however, wrong and unacceptable to look for the enemy exclusively within the LC ranks.

"The book also raises the question as to what is to be done next. For 5 years now the LC and working people in Yugoslavia, the Socialist Republic of Serbia and in Kosovo have been waging a determined struggle against Albanian nationalism and irredentism. Regardless of some mistakes, the struggle has yielded significant results in the efforts to put an end to the enemy's activity, to expose it ideologically and politically and to end the emigration of Serbs and Montenegrins from Kosovo. Socio-political actions in Kosovo must be directed towards achieving greater results in the economic activity, raising productivity, using capacities rationally and increasing exports. In addition, the entire Yugoslav community, and some of sections, in particular, must assume an even more responsbile attitude towards Kosovo, Sinan Hasani said."

TANJUG CITES SOVIET THEORIES ON WAR, PEACE

LD211818 Belgrade TANJUG in English 1638 GMT 21 Feb 86

[Text] Moscow, February 21 (TANJUG)--The biggest war danger does not come from the capitalist system as a whole, but from the "policy of aggressive imperialist circles." Dissociating from them are the "soberheaded and reasonable" members of the bourgeoisie who are aware that in our time there can be no winner once the nuclear force is used and who feel that the arms race narrows the possibilities of their accommodation to new conditions.

In this way the new programme of the CPSU and modern Soviet political thought explain the rapprochment and cooperation between the international workers' and Communist movement and the Socialist International. This question and the problems of war and peace are among the main themes of the Soviet analyses prepared for the 27th Congress of the Communist Party of the Soviet Union.

Soviet theoreticians studying the relationships between socialism, peace and war point to the danger of some ultra-leftist theories claiming that capitalism cannot renounce the arms race, i.e., that stable peace cannot be achieved as long as capitalism exists. Soviet political thought points out that similar theories are fraught with adventurism of the artificial instigation of revolutionary process and prevent the joint struggle for peace of all world forces opposed to war, regardless of their political orientations.

The example of neutral European countries--Finland, Austria and Switzerland--is being cited as a proof that "in principle, there is a possibility of capitalism developing without an arms race and militarization of the economy."

The analyses point out that the steady growth of prestige in the world of the movement of nonalignment is a major obstacle to capitalist expansionism. In capitalist countries themselves, a growing antiwar potential is becoming included in the mass antiwar movement, which was described as a "long-term influential factor of social life."

In particular, Soviet theoreticians reject the so-called theory of "equal responsibility" of the United States and the Soviet Union and of their military blocs for world tension and the arms race.

To the Soviet Union, this is an untenable theory because it proceeds from a "simplified picture of international affairs, overlooks the socio-economic character of social relations and boils down to formal international state activities."

According to the analyses here, this theory has been denied by numerous Soviet peace initiatives. Nevertheless, it remains dangerous because it "conceals the actual focuses of crisis and contradicts the essential nature of the course of imperialism and socialism."

VIDOJE ZARKOVIC RADIO INTERVIEW

LD091131 Belgrade TANJUG Domestic Service in Serbo-Croatian 1115 GMT 8 Feb 86

[Text] Belgrade, 8 Feb (TANJUG)--Despite all the oscillations, hold-ups, difficulties, obstacles, and wrong roads taken, the hopes and expectations of my generation's youth for the distant future, about the new Yugoslavia, have not been dashed. This is how Vidoje Zarkovic, president of the LCY Central Committee Presidium, prominent revolutionary, wartime fighter under Tito and well-known sociopolitical worker, begins his recollections and evaluation of the most important events of the past 40 years in the development of the LC and of Yugoslavia in a lengthy interview to Milos Jevtic, editor of Radio Belgrade's second program.

A land which once was no more than pocket change in the settling of accounts between its foreign overlords has grown into a free country whose reputation in the world and contribution to peace and equitable international cooperation is enormous, a country which has become the most loyal comrade and friend of all who are fighting for their freedom. I read recently that some researchers in Canada determined that in the United Nations, Yugoslavia takes sixth place in influence on world politics, an exceptional honor for our country.

Of course, said Zarkovic, actual trends have not always coincided with the plans for a new society created in the wartime period in the heads of the young Communists of the generation to which I belong. We thought we would be able to realize very quickly everything we wanted to once power fell into the hands of the Communists. Later we realized, some sooner and others later, the hard and often hostile reality of the material limitations.

I do not mean, Zarkovic added, to belittle the severity and seriousness of the problems our society faces today. I wanted to emphasize the undeniable fact that in our present difficulties it is not infrequently forgotten that this 40-year period is the most significant and, in its achievements, the richest epoch in the history of our nations and nationalities. We began the epoch in ashes and ruins, on the foundation of great poverty and great pressures on the freedom of the newly created country.

I believe, Zarkovic emphasized, that despite all the weaknesses we can be satisifed with what we have achieved. It goes without saying that there is still much to be done to realize the revolutionary ideals, plans, and visions of the LCY for building a new society. There is much work to be done and there will be more for future generations.

Speaking about the split with the USSR in 1948, Zarkovic said: It is well known that the Communist Party of Yugoslavia educated its members and working people with enormous enthusiasm and sincerity in the spirit of love for the USSR, as the first country to begin the era of building socialism, the country which bore and suffered the greatest burden in the destruction of fascism, a country which is the sincere comrade and friend of our nation and all nations fighting for freedom and a better life. For this reason, what happened in 1948 was indeed, at least for us young people, surprising, unexpected, shocking. From those quarters we did not expect any kind of attack, but rather assistance if anyone attempted to threaten our freedom and independence.

Prior to the Cominform resolution I was acquainted with the letters exchanged between our Central Committee and the CPSU Central Committee; but news of the resolution itself reached me on a train in Czechoslovakia. As a commissar in a unit of the Navy I was on my way to Prague for a major sporting event. As we know, RUDE PRAVO was first to publish the resolution and I read it, I remember, somewhere just before Bratislava.

I remember, too, that after the publication of the resolution the attitude of our hosts toward us cooled remarkably quickly. For me and my comrades in the naval command where I was serving, there were no problems or dilemmas over the stand we took. There were none for the simple reason that we were convinced, reading the resolution and following the campaign against us which immediately ensued, that the accusations against our party and country were founded on lies and slander.

As we know, there followed an economic blockade and the most furious propaganda which did not desist from claiming that our revolution had even been organized by the Gestapo. They went so far as to claim that troops [not further specified] had been massed on our borders. We experienced these attacks on our party and our country as a great insult to our revolution, an insult to our fallen comrades who remained on battlefields throughout the country.

The Communist Party was not destroyed then. The people were not separated from the party and the leadership. In the face of this slander our ranks closer even further. Only a few individuals fell by the wayside. None did so among my sailors in Prague. We were dismayed by such individuals because we realized that they were doing this mainly out of careerist or dishonorable reasons. They expected the victory of the powerful Stalin, and wanted to make sure they were found on the side of the victor and would profit by higher positions.

It is true, there were individuals who wavered out of confusion at the situation which had arisen. We tried to help them, to keep them with us, although perhaps in some cases we were not sufficiently patient and persistent. Any provocation which could be used as an excuse for armed attacks had to be prevented, Zarkovic recalled.

At first we thought that it was a question of a great intrigue by someone against the Yugoslav Communist Party, an intrigue which Stalin had been taken in by, but gradually we began to realize that a far deeper problem was involved: Stalin's hegemonistic policy. He was annoyed by the Yugoslav Communist Party precisely because it was at the head of an authentic revolution out of which grew a free and independent country which was nobody's satellite. We realized that it was a question of disagreement over the forms and paths of building socialism which were appropriate to the specific conditions of our country and the needs of our peoples.

And in these difficult and complex moments our party tirelessly endeavored not to let anti-Sovietism develop because of the clashes with Stalinism which justifiably aroused our people's anger. As we know, it did not develop.

The arrival in Belgrade in 1955 of the Soviet delegation which publicly admitted that the Cominform resolution and the campaign against us had been a mistake, began the process of reviving friendly relations with the USSR and other East European and socialist countries on the well-known principles established in the so-called Belgrade Declaration.

These are the principles of equality, mutual respect, regard for sovereignty, noninterference in internal affairs, recognition of the responsibility of every party toward its own people, and so on. On these principles these relations developed strongly and are still developing today, because it is in the interests of our countries and our peoples, stressed Vidoje Zarkovic.

If we look at what happened in 1948 from a distance of nearly 40 years, we see the enormous historical importance of our decisive resistance to the pressure on the part of the Cominform, both from the point of view of our freedom and independence and from that of the development of relations in the international workers' and communist movement on new equitable principles. Many stands of the Communist Party of Yugoslavia which were interpreted at the time as heresy have today become generally recognized principles in relations between communist and workers' parties.

There are attempts made in our country today, Zarkovic noted, to write about those days and events in an extremely one-sided manner, simply from the viewpoint of the fate of individuals. They ignore the specific situation, they ignore the fact that those were moments when decisions were made on the fate of the country and the revolution, that strong reaction against individuals who were deserting at that time were inevitable. If this is now hushed up and ignored and all reduced simply to the fate of individuals, then a distorted, false picture is given of it all. The full truth should be told about that period, and it demands a complete approach which does not exclude possible mistakes against individuals.

Asked to assess the importance of the changes in the names, the Yugoslav Communist Party and the LCY, or rather the changes in the way of realizing their leading role in society, Zarkovic stressed that this move originated out of the LCY's desire to have the rule in the name of the working class increasingly transformed into the direct rule of these masses themselves. Developing and conceiving a new method of realizing its leading ideopolitical role in society, which was why it also changed its name, the party was in fact contributing to the more successful development of society as a whole.

The LCY saw that any imposition of decisions on self-managing organs and delegate bodies from any side, and even on the part of the LCY, would hinder the development of socialist self-management. However, the party also proceeded in these changes from the knowledge that the development of self-management would not be possible, nor successful, without the activity of the LCY, which would, as an integral part of the working class, speed up within the self-managing structures everything which is progressive in society and oppose all that would hinder and slow up the development of socialist self-management.

The transformation process of the LCY, however, has not yet attained objectives which would allow it to become the real vanguard of a new kind, in keeping with the new historic needs of the revolution. In these processes we are constantly coming into conflict with two unacceptable tendencies: a dogmatic one, which takes us back to the positions of a one-party system; and a liberalistic one, which in fact aims at abolishing the LC as a vanguard or suppressing it to the margins of social events.

From the point of view of historic and revolutionary experience our society is in fact still very young. We are building an original road of social relations which has been recognized in the world. Therefore, Zarkovic said, we cannot make use of other countries' experiences and this is why the road we are following is neither easy nor simple. We always had to carry out a critical analysis of our own experiences in order to draw a lesson from them, eliminate weaknesses and mistakes, and further develop the system of social self-management in keeping with our general orientations.

The development of self-management has from the very beginning been accompanied by some negative tendencies and deformations such as group-ownership relations, a division between rights and responsibilities, attack on social property, anomalies in distribution and the like. All this, Zarkovic said, was accompanied by the erosion of morale in our scoiety. We must react to all this in due course in order to be able to go one.

In the continuation of his interview Vidoje Zarkovic talked about events from the early seventies--nationalism in Croatia, liberalism in Serbia, and the so-called dispute sbout the construction of roads in Slovenia. At that time various antisocialist--I would not call them forces--groups and individuals, became active. The LC and other progressive forces of our society resolutely opposed all this. Comrade Tito, as is known, personally stood up against all such phenomena and tendencies in the most vigorous manner. Tito's well-known letter mobilized all the progressive forces in our society, above all Communists, in a vigorous action aimed at preventing and eliminating such phenomena.

However, LC activity has not been restricted to immediate action against these tendencies. Alongside this the LC began large-scale activity involving the further development of our socioeconomic and sociopolitical system with the aim of reducing objective bases for countering such tendencies and similar ones and securing fresh steps toward the development of socialist self-management and the consolidation of the equality of our nations and nationalities. This was a period of great explorations and major reforms in this direction, characterized by the passing of constitutional amendments, the new Constitution, and a Law on Associated Labor. All these contributed to the development and consolidation of the fundamental principles of our society.

Speaking about Josip Broz Tito, who marked the birth and development of the socialist self-managing and nonaligned Yugoslavia with his revolutionary work, Zarkovic stressed that Tito was undoubtedly one of the most courageous fighters for peace, freedom, justice, and equality in the modern world. He added that we were aware of this when he was alive, while today it seems that the greatness and importance of his work is felt even more. Day after day we are assured in this and regardless of passing time we constantly feel the need to return to his work and to search and find guidelines and signposts in his visionary ideas for our further internal and international activities.

We must always be aware, particularly in today's complex social situation, of Tito's readiness and resolve to come to grips with all problems. Today, more than ever, emphasis is laid on the importance of his constant attempts to strengthen the unity of the LCY and its leaderships and the brotherhood and unity of our nations and nationalities as basic prerequisites for the further development of our socialist revolution.

I had the pleasure, Zarkovic said, not only of fighting under Tito's leadership, but also of knowing him personally, as a strategist, creator, man, and friend... [TANJUG ellipsis] Meeting with him always left me with an impression of dignity, courage, humanity, and nobleness. As only a few people do he had an unshakable faith in a working man and the creative force of working masses. He knew how to give meaning in a simple way to the true aspirations of our working class and our nations and nationalities and to fight for them with the persistence and perseverence of a Marxist, visionary, and hero.

There were always speculations about what would happen to Yugoslavia after Tito. These speculations, Zarkovic said, were in keeping with a popular proverb: One dreams about what one hopes will happen. These forecasters of the disintegration of Yugoslavia after Tito forgot that Yugoslavia was born from blood and from the deepest aspirations of our nations and nationalities, and that it is not some kind of a temporary or negotiable formation. They forgot that Tito became the essential part of our social body long ago and that he identified himself with our community, our working class, our path of internal socialist development, and our nonaligned foreign policy.

True, it is indisputable that Tito's departure left a great gap in our ranks. But we must overcome this gap and continue the successful development of socialist self-managing society, Zarkovic said, by relying on Tito's work and by intensified and collective efforts. The fact that Tito left us during his lifetime a well-established system of collective work on the highest social and political level made it much easier for us to consistently carry on leading the country, the LCY, and the Armed Forces.

A part of the interview was also devoted to the nonaligned policy. Vidoje Zarkovic considers that its beginnings were not in 1961 when the first Nonaligned conference was held, but that this event was the logical result of our foreign policy to date. In this connection he recalled Tito's numerous journeys to countries of Africa and Asia. In Tito's speeches of that time the concept of nonbloc, in real terms nonaligned, policy was clearly established. For this reason, he stressed, we cannot talk of some kind of a complete change of events in our foreign-political orientation which occurred on 1 September 1961.

According to Zarkovic's assessment the greatest event in the development of nonaligned countries was the sixth summit in Havana in 1979. This meeting was of great importance for preserving the unity of the movement of the bases of its original principles. Tito's personal contribution was enormous. The summit, he recalled, paid a special tribute to Tito as the most prominent creator of the movement of the nonaligned countries and the nonaligned policy. Because of Tito, nonalignment became the reality of present-day mankind and the only choice in the bloc division of the world, with all the dangers arising from this division. For this reason nonalignment becamse the unshakable orientation of Yugoslavia's foreign policy.

The most important causes of the economic crisis in the country are found in our own mistakes and weaknesses in recent years. We should say here that self-management was not the only cause of the crisis, it being a system which is in itself a negation of the crisis because it ensures the highest degree of initiative, creativity, and the involvement of individuals and collectives in production and other fields. This was said by Vidoje Zarkovic, president of the LCY Central Committee Presidium, in his interview of Radio Belgrade's second program, in which most attention was devoted to topical economic and social problems and LC tasks in this connection.

Zarkovic noted that the crisis in recent years was caused by strengthened polycentric etatism which suppressed self-management and encouraged voluntarism, autarchy, isolationism, the weakening of the country's and the LCY's unity, the very slow adapting to changes in international economic relations and the like. This led to the invasion of the economy by noneconomic elements, the wasting of production potentials, the squandering of social ownership which turned group-ownership into private ownership. On the other hand, it led to an ever-increasing tendency to weaken the material basis of soicalist self-management.

Those who only see causes of this kind and do not perceive it as part of global trends are making a mistake. If we overlook this, Zarkovic recalled, a wrong impression is created that everything would have been fine if the leadership had not made so many mistakes and in particular if we had not incurred so many debts. I do not, he added, negate the need to criticize either the leadership and their mistakes or the unfavorable influence of over-indebtedness on our overall state of affairs.

In his reply to a question about how we can overcome such a situation, Zarkovic stressed that the answer is primarily in further and speedier development of socialist self-management. The answer is also in the increased collective efforts of working people aimed at raising labor productivity, exploiting existing capacities and working hours in a more profitable way, coordinating all aspects of consumption with the realistic potentials of economy and the like. In any case, there are no magic moves which can resolve these problems overnight. Therefore, we must act accordingly.

Regardless of the complexity of the problems, he pointed out, I think there should be no doubt that we will overcome this phase in our development thanks to the strength of the working class and all the working people and citizens of our country. Communists must resolutely fight against defeatism and demoralization caused by difficulties, as they always have, thus always managing to achieve what appeared to be impossible.

Continuing the interview, the president of the LCY Central Committee Presidium did not agree with an assessment that no results were achieved in implementing the long-term program of economic stabilization. The very serious problems we face--a high rate of inflation, a fall in the standard of living, the exacerbation of liquidity and others--he warned, give the impression that nothing has been achieved of what was envisaged by the Stabilization Program. However, this impression is incorrect.

We adopted, although with serious delays, a large number of economic and systematic changes, passed the medium-term plan, achieved certain results in settling the country's balance of payments, significantly increased the covering of imports by exports, and secured a certain amount of surplus in the foreign exchange balance. This secured a more regular payment of a part of debts incurred through foreign credits and a better supply to markets of raw materials, semifinished goods, and some imported retail goods.

The crisis would have been much more serious and the situation much worse if we had not undertaken numerous activities since passing the long-term plan which led to these and similar results. For this reason we must not undervalue the results achieved so far with great efforts and self-sacrifice.

All this does not mean, of course, that we can be satisfied with efforts, self-sacrifice, and results achieved so far in realizing the long-term plan. On the contrary, we were slow, superficial, and inconsistent in realizing this program which we adopted as the program for a speedy way out of the eeconomic crisis.

By adopting a number of economic and systemic changes envisaged by the Stabilization Program, the medium-term plan, and the development of policy for 1986, at the end of last year we created conditions for a fresh and more favorable situation in the struggle for stabilization. Activity must now focus on implementing the established policy and on organizing the widest action aimed at better exploiting capacities, better and more profitable work, an increase in production geared toward exports and an increase in imports, speedier financial consolidation of the economy, the consistent implementation of anti-inflation policy and so on. We cannot secure the construction of self-managing relations and economic stabilization only by state and self-managing norms and restrictive measures, Zarkovic said. These are the processes which vitally depend on the progress of production forces and on the conscious activity of men who implement the established tasks and goals. These are, of course, the main issues to be dealt with at the 13th LCY Congress and at congresses and conferences in the republics and provinces.

Assessing the present situation in the Autonomous Province of Kosovo the president of the LCY Central Committee Presidium pointed out that it continues to burden the overall political situation and relations in the Socialist Republic of Serbia and the whole country. For this reason, he added, greater attention must be devoted to improving this situation in the light of the strategy of the general development of the country. This requires the tightest cooperation among all subjective forces in Kosovo, Serbia, and Yugoslavia as a whole.

Replying to the question, "Would counterrevolution occur even if Tito were alive?," Zarkovic stressed that its causes were established in the platform on Kosovo and added that these events would have taken place even if Tito were alive, regardless of the invaluable and incomparable historic role which Comrade Tito played in the internal and external stability and strength of our community.

Assessing the results achieved in the struggle against irredentists, Zarkovic stressed that the efforts of the subjective forces of Kosovo, Serbia, and the whole country have contributed to an improvement in social conditions and the security situation in Kosovo. In this struggle the greatest burden is being borne and the greatest contribution being made by the Communists, workers, and working people of Albanian nationality in Kosovo, which is also normal.

However, although the irredentists have been dealt powerful blows they still have not been overcome and are renewing themselves and operating in an organized way. We had to and we can achieve more in smashing the irredentists, especially in halting the emigration of Serbs and Montenegrins under pressure and in allowing those who want to return to their hearts. We should not, Zarkovic stressed, reconcile ourselves with the realization of the irredentist dream of an ethnically pure Kosovo.

We must be concerned by the differences in the assessment of the situation in Kosovo and results so far in implementing the LCY platform which have recently been expressed at some meetings at which this matter was discussed. They should concern us all the more as they are being expressed on a regional, or rather national, basis. Some see only problems and not the great efforts and certain results achieved in solving them. Others, however, belittle the fact that irredentism has not been overcome, that it is renewing itself, and that it is operating in an organized way and that the pressure is being kept up on the non-Albanian population in Kosovo.

Worrying, too, said Zarkovic, is the attitude on this taken by some information media, which, it appears, claim to be the avant garde in stirring up very problematical pressure on the LC, cadres, and organs in the province and the republic.

It is becoming increasingly clear that for complete success in stabilizing circumstances in Kosovo, a joint program by the provinces and the republics and Yugoslavia as a whole is needed to solve the problems there on a united Yugoslav basis.

Asked to comment on the disagreements in and on the federation and the fact that vital laws of this country are being passed with increasing difficulty in the SFRY Assembly, Vidoje Zarkovic stressed that disagreement and one-sidedness on and about the federation always comes about when the essential question is ignored of how much and by which channels working people, organized on the basis of self-management, have a practical influence on policy in our country.

There is absolutely nothing new, he said, in the fact that etatist bureaucracy in the republic, provinces, and the federation has strengthened. As a result, these sociopolitical communities are implementing their great legal authority, laid down in the Constitution, in the conduct of development policy, in determining vital conditions of economic activity, in the disposal of the funds of social reproduction, and in their intervention in income, to a great extent, in a way which has led and is leading to the restoration of state ownership monopoly over social resources and income. According to Zarkovic, this is the basic reason why integration of labor and resources continues to be paralyzed largely in the frameworks of republic and provincial borders.

The great and irreplaceable role of the republics as self-managing sociopolitical communities in our system and in our federal community has remained insufficiently developed. Thus, working people sometimes get the wrong impression about the republic which also leads to republic statehood and independence being mistakenly interpreted by one section of our public opinion as if it were virtually the source of all our ills. From such ideas individuals are drawing the wrong conclusion that the republics should be weakened as much as possible to strengthen the federation. Such views lead, de facto, to the recurrence of unitarist centralism which would, in one way or another, weaken the unity and cohesion of the Yugoslav community toward which we are striving.

Following the consistent logic of the Constitution, there is no contradiction between federal and republic interests. In these circumstance, Zarkovic recalled, reaching agreement is the normal democratic way of realizing and developing relations among equal nations and nationalities. If we are looking for reasons why these clear and very progressive principles in our Constitution are often distorted in practice, said Zarkovic, it should be seen which forces are formulating and representing republic, provincial, and common interests. If this were to be done by workers and working people in associated labor, organized on the bases of self-management, presumably these distortions would not have occurred or there would have been significantly less of them.

How, in your opinion, should the Socialist Republic of Serbia, and especially the Serbian LC be developed? was one of the questions.

It is true, replied Zarkovic, that the overall situation in the Socialist Republic of Serbia and the Serbian LC, with regard to relations between the republic and the provinces, or rather the Serbian LC and the Kosovo and Vojvodina LC's, is burdened by certain ideopolitical differences in the interpretation and implementation of the essence of constitutional and statutory guidelines. The bases of these differences are ideopolitical disagreements in the approach to questions of the unity of the Socialist Republic of Serbia, the content of this unity and togetherness, and the method for realizing it, the constitutional format of the SR of Serbia and the constitutional conception of the Socialist Autonomous Provinces [SAPs], which are within the SR of Serbia and, at the same time, a constituent element of our federation.

It is indisputable, Zarkovic stressed, that the expression of differences is demolishing the political and economic stability of the SR of Serbia, the SAP's of Kosovo and Vojvodina, and the whole Yugoslav community. Bearing this in mind, the LCY Central Committee Presidium, after many months of intensive activity, has adopted stances on the current questions of implementing relations on which are based the unity and togetherness of the SR of Serbia and the LC of Serbia. In these stances, which the LCY Central Committee later adopted, the duties and immediate tasks of the LC of Serbia and the LC's of Kosovo and Vojvodina for transcending present difficulties are quite clearly and concretely pointed out.

Replying to the question of what he thinks about the "hot" social problems, such as unemployment, the phenomena of nationalism, foreign debts, the position of the young generation and so on, Zarkovic recalled that the LCY Central Committee has already adopted clear stances on many of these questions and that the others will soon be on the agenda of its sessions. For this reason he only commented in principle on the question put to him. I believe, he said, that only idealists imagine a world without contradictions, problems, and conflicts. As Communists and Marxists, we are aware that our social development is full of contradictions, that in each stage in our development there were plenty of problems, and that there will be problems in the future, too.

However, what concerns us is that at this point in our development so many problems have accumulated that we can talk of an economic crisis and a crisis situation in society. In order to overcome this situation more quickly we must more rapidly and boldly solve the very acute contradiction between etatism and self-management in our production relations, naturally to the benefit of self-management. This is, said Zarkovic, that weak link which needs to be removed from the chain to accelerate solutions to a series of problems.

But even when we do this, we will still not be without problems nor can we dream of a society without difficulties and contradictions. Practice alone and development will throw up new problems. Our orientation must be to solve problems which are on the agenda as quickly as possible and in doing this being careful that our solutions do not create new problems as they have often done up to now.

The interview went on to cover preparations for the 13th LCY Congress and the expectations of this most important gathering of Yugoslav Communists. Precisely because, Zarkovic said, we are coming up to the congress greatly burdened with problems, severe contradictions, slow-downs, and certain distortions in the implementation of our goals and strategic decisions, working people and Communists are expecting a lot from the 13th Congress.

From the 13th Congress, Zarkovic added, decisiveness, courage, and knowledge is expected to uncover more intensively, with the help of Marxist principles and a communist principled manner, the causes of the existing contradictions, the economic crisis, the inefficiency of the system and, on the basis of this, come to the link which will pull the chain in the direction of economic, ideological, moral, and cadre--in a word socialist self-management--renewal and a more consistent development along this path.

Some matters regarding the preparations for the 13th LCY Congress were touched upon in the continuation of the interview.

Throughout the preparations for the congress and in the congress itself, the LCY will not reexamine the basid strategic tenets regarding its internal development and international policy which have been established under Tito's leadership. But at the same time this means that we must openly [otvoreno] and critically analyze the functioning of our economic and political system, our economic policy, our policy of development, the behavior of the LCY, and all other subjects in order to find out what has slowed down in our country's moving toward achieving our general tenets.

The fundamental imprint to the precongress preparations is provided and will be provided by the knowledge gained through general party discussions conducted concerning the 13th LCY Central Committee session. The demands and wishes of the Communists and working people expressed in that discussion have confirmed their unshakable loyalty to the LCY Program tenets and their dissatisfaction about the speed of overcoming the economic crisis, and have manifested the readiness of our working people to invest greater efforts in order to achieve the economic and political stability of our country, Vidoje Zarkovic said among other things.

BRIEFS

DELEGATE ACCUSED OF TAKING BRIBES--The communal public prosecution office in Pristina has sent to the Assembly of the SR of Serbia a request for the lifting of a delegate's immunity so that it could start legal proceedings against Ahmet Dobrune, delegate to the Chamber of Municipalities of the Serbian Assembly from Glogovac, who as the director in charge of cadre questions in the Feronikal organizations is under suspicion of receiving bribes from some individuals in return for jobs. Dobruna is alleged to have received from some individuals worth DM4,530, 4,300, and 40,000 dinars for providing them with jobs in Feronikal. Thisis in fact why legal proceedings against Dobruna and six other individuals who were bribing him is demanded. They are as follows: Nazif Bujupi (aged 41) from the village of Orlabit and who is currently under arrest, Malic Thaci (aged 33) and Sabit Thaci (aged [number indistinct]), from the village Lepusnik, Saban Bujupi (aged 41) from Orlat, Nazir Salja (aged 36) from Vucak, and Izet Bahtiu (aged 41) from Nekovac. FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

NEW DEPUTY MINISTER OF AGRICULTURE DOBOCZKY INTERVIEWED

Budapest HETI VILAGGAZDASAG in Hungarian No 46, Nov 85 p 57

[Biography of and interview with Istvan Doboczky, new Deputy Minister of Agriculture and Food Industry; date and place not specified]

[Text] Istvan Doboczky, named a few days ago as Deputy Minister in the Ministry of Agricultue and Food Industry from his post as the Hungarian agricultural attache in Washington, was born in Abadszalok on January 10, 1928. He attended elementary and junior high school in Torokszentmiklos, and in 1943 he enrolled at the secondary school of commerce in Eger. In 1945 he did not continue his studies but rather went to work: he became a newspaper deliveryman and then a newspaper distributor. Later, in addition to his job, he attended the high school for workers in Torokszentmiklos. For a short time in 1949, following his graduation from high school, he found a position at the Kobanya Public Project (Construction) Enterprise and then became a clerk at the State Agricultural Engine Plants. He completed studies to become a clerk, and at Gyomro he became the head bookkeeper at the local Agricultural Machine and Tractor Station.

He taught at the Kecskemet agrarian academy's bookkeeping department for agricultural machine and tractor stations, and he instructed those head bookkeepers who were employed at agricultural machine and tractor stations. After 1954 he first had a position at the Cegled Machine and Tractor Station and then at the one in Szolnok; at both places he was employed as head bookkeeper. In the meantime he completed law school, but his ambition drove him on; he acquired training to be certified as an accountant and price expert.

In 1968 he came to Budapest to work in the economic main department of the Ministry of Agriculture and Food Industry. Here he first worked as a price expert; by 1975 he had been promoted to director of the price and income department. 1975 was a big turning point in his life: they sought him out and asked if he would like to transfer to the secretariat working with the Council of Ministers, as Deputy Prime Minister Ferenc Havasi's agricultural expert. He said yes. He worked in this capacity until the beginning of 1981 when he went to Washington as agricultural attache, holding that post until the summer of 1985 when he was named deputy minister. His hobbies are hiking and hunting. He is a member of the ministry's hunting club.

[Question] Did you receive the news officially or from another source?

[Answer] Directly from the minister. He informed me that they were counting on me for this post.

[Question] Were you surprised?

[Answer] No, because I knew that they regarded me as one of the leading cadres in agriculture, and I also knew that there was a need for me at home.

[Question] You gave up your post as the agricultural attache in Washington for the position of deputy minister. What is it that you learned over there that you might be able to utilize in your new office?

[Answer] Perhaps that a lot depends on personal contacts and that here at home there is also a need to build and cultivate contacts. I had witnessed the advance of biotechnology in agriculture, as well as the penetration of computerization into this area. I learned first-hand how much this field can profit from quickly utilizing the results of scientific advances. Without a doubt, any hesitation on our part could mean that we will irreversibly fall behind.

[Question] As an attache, what did you do so that this would not happen?

[Answer] I tried to provide support for the development of Hungarian biotechnology, in a manner that would point toward the right direction. I tried to create liaison between the research centers abroad and Hungarian universities, to promote travel abroad of Hungarian experts. There is an agreement in effect between the pertinent ministries in Hungary and the United States, on the basis of which opportunities arise for the exchange of experts. As a result of my efforts I was able to achieve that today more people are able to travel abroad to exchange experiences, and not just for one or two weeks as it was years ago.

[Question] To what degree did your view of Hungarian agriculture change during your Washington stay?

[Answer] I quickly became conscious of the fact that we have fallen behind in several areas. For example, we do not have the requisite infrastructure which would support agriculture. In the United States one can dial Hungary from any out of the way sheep-farm, or one can make arrangements to have a disabled tractor's part replaced within hours.

[Question] What is the job of an agricultural attache?

[Answer] I should start with the fact that this post is a Foreign Ministry appointment. The attache works at the embassy, under the supervision and guidance of the ambassador. His job is to provide the Ministry of Agriculture and Food Industry with information, to nurture scientific-technological contacts which promote agricultural development. At this time, such posts exist in five locations, at our embassies in Moscow, Bonn, Copenhagen, and Washington, and at the FAO headquarters in Rome.

[Question] As deputy minister, what area of competence has been assigned to you?

[Answer] I am responsible for the international economic contacts of Hungary's agriculture, and for overseeing operations from the point of view of legality.

[Question] Didn't you ever think about directing a large state farm one day?

[Answer] For many years I was the head bookkeeper at several large agricultural machinery repair stations; at that time, I had no desire to obtain higher positions.

[Question] Of which of your personal abilities are you the proudest?

[Answer] They say that my ability to make contacts is good.

[Question] And what fault do you recognize in yourself?

[Answer] I am not meticulous, so I always have to have a good secretary who can keep my papers and notes in order.

[Question] From whom have you learned the most?

[Answer] From the Deputy Prime Minister in the secretariat of the Council of Ministers who chose me to work with him. I learned from him how to deal with people. While there, I never felt myself in "an ivory tower."

[Question] Do you regard yourself as ambitious?

[Answer] The truth is, I never thought that one day I would be a deputy minister. Of course, I wanted to better myself, but who doesn't? But even as a beginner, and later too, I always tried to do my best.

[Question] In your career, how much can you attribute to your own abilities and how much to luck?

[Answer] I was always lucky, because even without a real patron, and without any special effort to seek out new positions, I have always received the type of assignments I found appealing.

[Question] Whom do you blame if agriculture ends up with a year below expectations?

[Answer] As a rule, the weather. Fortunately, Hungarian agriculture has by today reached the point that it can moderate such a negative influence.

CAUSES FOR DECLINE IN FARM PRODUCTION ANALYZED

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian 1 Dec 85 pp 16-17

[Article by Scepan Rabrenovic: "Politics as a Natural Disaster"]

[Text] When at a recently held session of the Council of Republics and Provinces of the Assembly of Yugoslavia, Vojvodina delegate Nikola Srezentic stated that the fall plantings were late and that not as many hectares as planned would be sown, Janez Zemljaric, the Vice President of the federal government, and Milorad Stanojevic, the chairman of the Federal Committee for Agriculture disagreed with him. They both asserted that "there is no reason why the plan for sowing should not be carried out."

Only a few days later, it turned out that delegate Kmezic [as published] was nevertheless correct: according to the latest data, about 1,100,000 hectares were sown with wheat this fall, i.e., about 350,000 hectares less than planned. There is no time left to do anything.

Two Catastrophic Years

Now, one can already state with confidence that next year we will be eating bread from imported grain. Not just because fewer hectares were sown, however. That is the last reason, since even with the hectares sown it would be possible to produce about 6 million tons of wheat (the genetic potential of the strain is even higher), but one can estimate with certainty that next year the harvest yield will be even lower than it was this year. The proof -- even in the grain-growing regions of Serbia, this year peasants plowed their land wth plows drawn by cows and oxen, and only a few of them sowed their fields with high-quality seed. They virtually did not even use mineral fertilizers.

The "return" of cows and oxen to the fields can be explained most convincingly by the situation that agriculture has been in for the last two years. At the above-mentioned session of the Council of Republics and Provinces, Nikola Kmezic described last year's situation as follows: "The prices of agricultural products grew at a rate of 44 percent, the prices of industrial products at a rate of 82 percent, and the prices of industrial products that represent inputs for agriculture, at a rate of 87.5 percent. In the same year, the prices of oil derivatives, which have a decisive influence upon the use of modern agricultural equipment in agricultural production, were increased by

108 percent, the prices of chemical products for agriculture grew by 113 percent, and the prices of artificial fertilizers by 129 percent. In the same year, the prices of agricultural machines grew by 74 percent."

Agriculture's situation this year was described by Milorad Stanojevic, the chairman of the Federal Committee for Agriculture, at the session of the Council of Republics and Provinces: "The prices of agricultural products grew by 47 percent, while the prices of producer goods of industrial origin for agricultural grew by 62 percent. Labor organizations in the area of agriculture have only 9 percent of their own funds available."

This is the explanation of why this year interest amounted to 19.5 percent of income in the economy, 26.5 percent in industry, and 71.8 percent in agriculture, and of why the losses in agriculture are five times larger than in industry.

Interest did not have such a disruptive effect upon agriculture just because of the slower growth in the prices of agricultural products, but also primarily because of the longer production cycle in this branch of the economy.

If one knows all of this, then it is not surprising that farmers are "introducing" cows and oxen into the fields again, that they are sowing mercantile wheat, and that they are not using mineral fertilizers. The costs of plowing and sowing one hectare by mechanical means exceed 15,000 dinars. Last summer, for example, for the money obtained by selling a calf, it would have been possible to buy 250 kilograms of mineral fertilizers and 10 kilograms of seed corn.

Unconvincing Explanation

The Federal Executive Council explains the 9 percent decline in agricultural production this year as a result of the frost last spring and the drought this summer. (It was calculated that the total damages from this amount to about 130 billion dinars, or $140 million).

The question, however, is how convincing this explanation can be, since if other terms, agrotechnological ones, had also been taken into account in the harvest along with the optimum ones, neither the frost nor the drought could have done as much damage. The drought and the frost only finished off everything that had not been done as it should have. This is the reason for the assertion that the greatest natural disaster that happened to agriculture is actually the official economic policy. And this disaster has been continuing for two full years now, with some chances of being continued longer, since no one knows of any attempt whatsoever to change the attitude toward agriculture. (If it exists, the public has so far not been informed about it.) This is naturally under the condition that "change" does not mean the 8 percent planned growth rate for agricultural production next year. If there really has been no consideration of any major changes that would alter the position of agriculture, this also indicates that agricultural production, even if increased by that much, would be 1 percent lower than the level of production last year.

In effect, this means that the planners have more confidence in circumstances of time than they do in a well-planned agrarian policy.

The Long-Term Economic Stabilization Program says that on the whole the status of this branch of the economy should be changed, so that food producers, like the rest of the producers in the country, would have the right to decide independently about the way in which income is obtained and distributed, and that the value of agricultural production should be established mainly by the market.

Agriculture is still predominantly "in debt for supplies," but that status is imposed on it from outside, primarily through the "agreements" among the republics and provinces. Since the republics and provinces do not all have equal conditions for the production of food, the prices, after strong tensions, are always adopted late. But as early as the sowing it should be known how much will be harvested, just as it should be known how much a cow will be milked in five years if a heifer is bought now.

Agriculture has not even had equal status with the other branches of the economy with respect to foreign economic relations, and so it has been harmed there as well. The majority of agricultural products are still covered by permits. Here is what happened last fall, for instance: during the harvest, the price of corn on the world market was $147 per ton, so the farmers asked for approval to export it. They did not receive the approval then, but rather later, when the price of corn on the world market had fallen to $105 per ton, and so $30 million was lost in exporting the same amount. The loss is even greater if one is aware that a considerable amount of corn "spoiled" in the silos, so that the livestock industry also lost it.

Who Will Become One of the Losers?

Certainly the slower growth of the prices of agricultural products was also influenced by the fact that the purchasers had become poorer (there were no shortages, even though production had been considerable reduced), but how can one explain the fact that for two full years no one even tried to close the price scissors that had been opened to the detriment of agriculture? It would have been natural for an emergency situation to be proclaimed in this branch of the economy at the end of last year, but it has not been proclaimed even now. This was probably because of a belief that not everyone in the country bears the consequences of agriculture's position equally. (On the basis of agricultural prices alone, an enormous income flowed from the agricultural regions to the nonagricultural ones, and with respect to Vojvodina, it can be stated with certainty that this province had already paid its contribution to the undeveloped regions through lower prices for agricultural products.)

Milorad Stanojevic, the chairman of the Federal Committee for Agriculture, justified himself at the session of the Council of Republics and Provinces by saying that development policy in the area of agriculture was under the jurisdiction of the republics and provinces, and that "as a rule, lower investments than necessary are planned, and as a rule, only half of that is carried out."

How can one go into a branch of the economy that "produces" only losses? It is the responsibility of the federal government to use various measures to create conditions in which it will pay to invest in the production of food. But this has not been done. And not just this.

The consequence of such a total negligence toward agriculture, in which credit-monetary policy should also be included, is that we have turned a branch of the economy that should have been a stabilizing factor into a branch of the economy that is destabilizing an already serious economic and social situation.

And no one seems to care.

BUDGET MANAGEMENT IN 1984 EVALUATED

Prague FINANCE A UVER in Czech No 7, 1985 pp 433-442

[Article by Eng Belo Bosak, candidate for doctor of science, director of state budget division of Federal Ministry of Finance: "Budget Management in 1984"]

[Text] On the whole we can put a positive evaluation on the next to last year of the implementation of the economic and social policy objectives that were established by the 16th CPCZ Congress for the Seventh 5-Year Plan for national economic development. In his speech on the 12th Plenum of the CPCZ Central Committee Comrade Gustav Husak stated: "The reason for evaluating our performance as positive is that planned targets have been exceeded, domestic and foreign economic equlibrium have been enhanced, hard currency indebtedness has been further reduced, cooperation has been expanded with the Soviet Union and other socialist countries, records have been set in agriculture, initial steps have been taken to reduce raw material and energy intensiveness and, last but not least, the domestic market has been well supplied, especially with food. This has set the groundwork for the fulfillment and in some cases the overfulfillment of the tasks for the Seventh 5-Year Plan."

Certain fundamental positive trends of 1983 continued and were enhanced in 1984. In particular there was a further increase in the economic growth rate, largely as a consequence of the implementation of resolutions of the 10th CPCZ Central Committee Plenum which the CSSR Government had incorporated in an updated state plan and in the priority tasks that were set in order to exceed previous plan indicators. Increased material and financial resource formation was related to the overfulfillment of planned tasks in critical branches of the national economy, and was accompanied by an increase in efficiency.

Gross national product in adjusted 1977 prices increased last year, according to preliminary data, by 3.2 percent over 1983; it was almost Kcs 5 billion higher than projected by the plan. At the same time industrial production increased by 4 percent (the plan projected a 2.5 percent increase), the volume of construction work by 1.9 percent (the plan had projected 0.7 percent), and gross agricultural output increased by 3.6 percent, thus achieving an increase of 6.9 percent over plan projections for this branch. Overall, this increase in the rate of material resource formation was achieved with lower standard consumption of fuels, raw materials and subassemblies, and we were successful in further reducing transportation intensiveness. All of the above amount to the successful fulfillment of the resolutions of the 10th CPCZ Central Committee Plenum.

Labor productivity increased in 1984 at a faster rate than in the preceding years of the Seventh 5-Year Plan. This increase, however, was accounted for mainly by faster than projected increases in the capital asset per worker ratio. The long term trend of reduced efficiency of capital assets continued. This means that the potential inherent in investments made in previous years continues to be underutilized. The same is true of inventories, another area to which we have committed significant resources.

The above facts and other negative phenomena that have carried over from previous years of economic development and plan fulfillment and which continue to hold back the achievement of greater efficiency simply mean that 1984 performance, while on the whole positive, should not be overestimated.

A key issue remains the consistent introduction of R&D findings into the entire process of planning and national economic management so that the accelerated intensification of development both overall and in specific areas of capital replacement can proceed at a pace appropriate to current requirements. The increase in technical-economic paramaters, quality, and the use values of production assets and consumer goods that is vitally necessary for our economy can be achieved only in this way.

The sophistication of foreign markets is growing, along with political discrimination and protectionist measures in capitalist countries, depending on how the crisis affects their economies. Commercial relations are also affected by changes in credit conditions, high interest rates, fluctuations in exchange rates, changes in world prices, etc. Under such conditions it is possible to export, without losses to the national economy, only state of the art products in both appearance and specifications. These products must also be serviced. Achieving an increase in innovational activity and the ability to adapt on the part of production and trade organizations that could lead to greater value added to the work of our society remains a problem that will have to be addressed in the future with much more emphasis than to date.

More rapid national economic development and the improved utilization of intensification factors is being retarded by certain deviations from planned objectives, inconsistency in task fulfillment, and the failure to make use of existing reserves. In addition to objective influences one cannot overlook the fact that subjective influences have an impact as well. These include shortcomings in the work of certain organizations, which so far have not been able to deal with the more rigorous economic conditions of the current phase of national economic development. Their performance, their low level of economic efficiency, combine to reduce overall achieved performance.

Even with these drags on performance the overall record of these enterprises is promising. Performance in 1984 was characterized by a strengthening of positive trends in the direction of fulfilling the tasks for the Seventh 5-Year Plan and the formation of relatively positive preconditions for a successful start in the Eighth 5-Year Plan.

Financial and budgetary policy in 1984 was aimed at assuring and facilitating the fulfillment of tasks of economic and social development, and especially those related to increasing efficiency, improving economic equilibrium, and assuring the standard of living of the general public.

National economic results and the conditions under which economic development occurred are reflected in the results of budget management in 1984.

The following results were obtained related to increasing the efficiency of production:

--on an adjusted basis the profits of economic entities increased by Kcs 16.1 billion, i.e. by 14.1 percent; in the domestic economy 74.6 percent of this increase in profits could be accounted for by decreased costs and 25.4 percent by an increase in revenues;

--total costs (exclusive of foreign trade) were 90.93 percent of revenues, which was 0.53 points lower than projected by the plan; at the same time materials costs were 0.58 points lower than projected in the plan;

--because of the above factors return on investment was 11.41 percent in 1984, or 0.88 points higher than planned; return on capital assets was 5.70 percent (0.63 points higher than planned) and return on adjusted value added was 29.41 percent (1.80 points higher than planned);

--the final balance in the relations of state economic organizations to the state budget, excluding sales taxes and domestic market differences, was Kcs 87.1 billion in 1984. The budget was underspent by Kcs 2.9 billion economic mechanisms of factory organizations [ZO]; the target balance for the domestic economy was exceeded by Kcs 3.1 billion;

--inventory turnover time in industry and construction was shortened by 4.5 days (the plan projected a reduction of 3.4 days);

--total state organization demand for financing capital construction reached Kcs 162.58 billion, which was Kcs 19.96 billion higher than planned; the state budget covered 22.5 percent of this demand, or Kcs 36.66 billion;

--noninvestment expenditures for R&D amounted to Kcs 17.7 billion, or Kcs 0.4 billion less than budgeted. The state budget financed Kcs 7.6 billion of these expenditures, or 5.7 percent more than in 1983;

--foreign financial relationships ran in the black, and we further reduced our foreign indebtedness; this was accomplished by increasing exports while decreasing imports. Exchange relations with our foreign partners worsened during the year.

The record in implementing financial and budgetary policy related to the standard of living was as follows:

--noninvestment expenditures on public services and amenities for the general public were Kcs 154.3 billion in 1984, or about 2.9 percent higher than in 1983; on a per capita basis the figure was Kcs 9,850, which was Kcs 264 higher than the previous year;

--the above figures include 1984 expenditures for social security of Kcs 82.8 billion (up 2.5 percent from 1983), Kcs 25.7 billion on education (a 3.5 increase), Kcs 24.1 billion on health care (an increase of 4.6 percent), and expenditures on culture of Kcs 4.8 billion (a 1.9 percent increase over 1983);

--public assistance to families with children (i.e. monetary assistance for child raising, equalizing contributions, childbirth support, allowances for children and a maternity contribution) amounted to Kcs 17.4 billion; when other forms of assistance available as monetary, merchandise, and other discounts total outlays in this area were Kcs 36.5 billion. These amounts are levelling off because of an ongoing decline in birth rates;

--state budget expenditures for housing construction and maintenance were Kcs 26.9 billion, which exceeded the budget by Kcs 0.7 billion (this overage came about because of excessive expenditures for housing construction);

--total nominal monetary incomes of the general population were Kcs 403.7 billion, an increase of 2.6 percent over 1983 (wage incomes increased by 2.4 percent and social security incomes by 2.2 percent). Taxes on wages increased from 17.4 percent to 17.5 percent in 1984;

--total savings increased to Kcs 205.0 billion, which is Kcs 0.5 billion more than planned; on a per capita basis this amounts to average deposits of Kcs 13,300; new loans were made in the amount of Kcs 10.3 billion, increasing the total loans outstanding to Kcs 36.8 billion.

Analyses indicate that the positive 1984 performances figures resulted to a significant extent from the implementation of the Set of Measures. These studies also show, however, that to increase efficiency and implement the strategic objectives of economic policy it is essential substantially to increase efforts to assure in a comprehensive way the shift to an intensive form of economic growth.

Performance in State Budget and National Committee Budget Goal and Task Fulfillment

In line with the positive performance in state budget management in the recent years of the Seventh 5-Year Plan, the 1984 state budget also pursued the goal of operating a balanced budget and generating the financial resources needed to assure the future development of our entire society. The achievement of these objectives has in the past been predicated on further increases in our economic efficiency, on the thorough implementation of the principles adopted in the efficiency enhancement program for the Seventh 5-Year Plan, as well as on the discovery and exploitation of underutilized capacity in individual sectors of financial management.

State budget management in 1984 reflected all of the positive as well as negative phenomena that had an impact on the economy during the year and which had to be dealt with. Nevertheless it may be stated that the fundamental task, i.e. the achievement of a balanced budget throughout the CSSR budgetary system, was achieved and that the performance in state budget management contributed to the further improvement of our economy. Among the most positive results was the exceeding of planned tasks by economic organizations. This was reflected in an increase in the share of the economic sphere in national economic resource formation and in higher revenues for the state budgets. The balance in the relations between economic organizations and the state budget increased by Kcs 9.8 billion over 1983.

State budget and national committee budget management finished the year with revenues exceeding expenditures by some Kcs 1.6 billion. This represents a further contribution to fulfilling the objectives of the Seventh 5-Year Plan in the area of financial and budgetary policy and national economic resource formation.

Table 1 presents the overall results of management in 1984.

Table 2 presents the overall relationships between the state budgets in the CSSR for 1984.

In line with the objective of improving planned management an integrational and coordinating function has been introduced for the state budget of the Czechoslovak ederation within our budgetary system. Revenues of the state budget of the Czechoslovak Federation accounted for 64.9 percent of the total revenues of all three state budgets, while its direct expenditures were only 20.9 percent of the total. Most of the expenditures of the state budget of the Czechoslovak Federation (67.8 percent) were in the form of subsidies to the republic budgets. As in previous years in 1984 these subsidies were in the aggregate granted to the republics in the planned amounts with a view to their requirements in the area of economic instruments for foreign trade. Special purpose subsidy targets for the state budgets of the republics were fulfilled by 103.7 percent, and aggregate subsidy targets by 96.9 percent. Special purpose subsidy targets were exceeded in two primary areas: selected price subsidies related to rating mechanisms in agriculture that are tied to the fulfillment of material indicators; and selected investment projects, primarily related to comprehensive housing construction.

Budget management activities of national committees finished the year with a surplus of Kcs 1.54 billion. This overage has already been reduced by deposits of supplementary revenues in excess of the plan (Kcs 1.63 billion) and adjusted upward by the payment of taxes on agricultural profits (Kcs 0.78 billion).

In view of this budgetary surplus and remaining balances in contingency funds and development funds of national committees as of 31 December 1984 (a total of Kcs 1.189 billion), and after aggregating supplementary revenues and prior to closing out the financial records for 1984, the available resources in contingency and development funds amounted to Kcs 4.363 billion; in addition, the national committees have available as of 1 January 1985, in associated resource accounts, a nationwide sum of Kcs 1.158 billion (Kcs 984 million in the CSR and Kcs 534 million in the SSR).

The above resources, combined with the formation of other supplementary resources in 1985 constitute the most necessary resources for achieving the objectives of Project Z and to support the development of local initiatives by national committees.

One of the most effective mechanisms used by national committees to carry out successfully the tasks mandated to them by election programs in Project Z. National committees have expended a total of Kcs 3.51 billion on this program (Kcs 2.43 billion in the CSR, 1.08 billion in the SSR). Completed investment projects related to this program are valued at Kcs 4.27 billion (Kcs 2.89 billion in the CSR and Kcs 1.38 billion in the SSR).

Table 3 lists examples of important projects completed under Project Z in 1984.

Financial Performance of Economic Organizations

In 1984 economic organizations greatly overfulfilled planned tasks in both quantitative and critical qualitative indicators. In comparison with previous years their growth rate increased at the same time that costs were being cut more rapidly. The results are presented in Table 4.

Planned profit targets were exceeded by Kcs 11.3 billion. This result was influenced to some extent by inaccuracies in the estimated actual 1983 levels (which was underestimated by Kcs 4.6 billion) which was used as the basis for setting plan tasks for 1984.

In Resolution No 120, dated 10 May 1984 the CSSR Government established priority tasks aimed at exceeding state plan indicators for 1984. These tasks were broken down by supervisory agencies and specific tasks assigned to individual organizations. In line with this goal the priority program for the output and adjusted value added indicators was fulfilled by 101.5 percent. These priority tasks made it possible to exceed planned profit targets by Kcs 6.9 billion (while there was no specific priority task set for profits, the plan would have been exceeded by 103.5 percent).

Profits had already begun to increase rapidly in 1983 (the 1983/1982 index was 112.8 percent). This was made possible mainly by intense efforts to reduce materials costs and to renew the growth of the national economy, with a consequent positive influence on reducing other types of costs. These factors had an even more significant impact in 1984, and this became evident in an even better growth rate for profits (the 1984/1983 index was 114.1 percent). Such a rate of increase in profits was unprecedented in this or any previous 5-year plan, as shown in Table 5.

The factors affecting the achieved year to year increase in profits are listed in Table 6.

Even when foreign trade and exceptional yields are excluded from the calculations the increase in profits for the domestic economy was high, with the 1984/1983 index at 113.1 percent. A critical factor was a decrease in total costs of Kcs 9.9 billion the greatest percentage reduction (0.86 percent) of the Sixth and Seventh 5-Year Plans.

Total costs as a percentage of outputs were 0.53 points lower than projected by the plan. This represents profit formation of Kcs 6.7 billion in excess of the plan. Plan tasks were filfilled for all major costs categories with the exception of the financial.

- from foreign trade	0.50		2.57		2.07
- from exceptional yields	-0.52		0.28		0.80
- from domestic economy	4.78	100.0	13.21	100.0	8.43
Including:					
- from increased output	1.64	34.3	3.35	25.4	1.71
- from reduced costs	3.14	65.7	9.86	74.6	6.72

Materials costs (excluding depreciation) and nonmaterial services also significantly influenced the development and fulfillment of the profit plan for 1984. This intensification factor is directly related to the implementation of the Set of Measures (incentives for improving adjusted value added). In comparison with the previous year materials costs declined by Kcs 10.1 billion (materials consumption by Kcs 6.7 billion and fuel and power consumption by Kcs 4.4 billion, while other costs of a material nature and costs of nonmaterial services increased moderately). Materials costs as a percentage of output were 0.58 points lower than set by the plan, with the savings amounting to Kcs 7.4 billion. The priority task for this indicator was set at 64.75 percent, while the actual performance was 0.18 points better.

The negative impact of a rapid increase in capital asset depreciation (a 1984/1983 index of 105.3 percent) on the evolution of the overall cost structure further declined in 1984 in conjunction with the increased growth rate of output. In comparison with the previous year these costs increased by Kcs 1.2 billion. Depreciation as a percentage of outputs was 0.06 percent lower than set by the plan, with realized savings of Kcs 0.8 billion.

Wage costs increased more rapidly in 1984 than projected by the plan (1984/1983 index of 101.4 in the plan, while actual index was 102.4 percent). This amounted to an increase in total wage volume of Kcs 1.8 billion. In relation to the achieved increases in output, the cost structure, and profit formation this increase in wages was a positive phenomenon. Wage costs declined by 0.87 percent as a percentage of output (in 1983 the figure had been only 0.52 percent, while in 1981-1982 the percentage has actually increased), with the relative reduction amounting to Kcs 1.5 billion. Wages as a percentage of output were 0.09 points lower than projected by the plan. This represented relative savings of Kcs 1.1 billion. Likewise the percentage of wages in adjusted value added (39.6 percent) was better than projected by the plan (40.3 percent).

Financial costs in 1984 increased, even though the plan had projected a reduction (actual 1984/1983 index was 104.0 while projected had been 99.2). This represented an increase from the previous year of Kcs 0.6 billion. The planned level for financing costs as a percentage output was exceeded by 0.22 percent, which amounted to Kcs 2.8 billion. The main reason for this poor performance were increased costs caused by shortfalls, damages, fines and penalties. Costs for such items increased in comparison with the previous year by Kcs 0.8 billion. The plan does not factor in these costs, but they nevertheless exert their full weight on plan fulfillment (in 1984 these costs totaled Kcs 2.3 billion). The impact of other components of financial costs largely offset each other, both in terms of development and in relation to the plan.

By all measures of profitability 1984 was a significantly better year than projected by the plan. The return on investment target was exceeded by 0.88 percent, return on adjusted value added target by 1.80 percent, and the return on capital asset target by 0.63 percent.

We did not succeed in fulfilling plan objectives comprehensively in inventory development and utilization (including priority tasks). Certain positive trends, however, continued to be evident in inventory management, resulting in further reductions in inventory increases and improved inventory utilization in comparison with the previous years of the 5-year plan.

The following trends were evident in inventory development in 1984:

--improved inventory management in industrial and construction organizations, including both an absolute reduction in inventory increases from previous years as well as improved inventory utilization, i.e. a speeding up of inventory turnover time in days;

--greater increases in inventories in agriculture and food organizations made possible by better harvest performance than projected by the plan;

--improved inventory growth in domestic trade, which partially contributed to the improved satisfaction of consumer demand;

--improved inventory growth in fuels resulting from positive mining results and desirable levels of pre-deadline deliveries.

Inventory during last year also showed the results of certain measures, especially the implementation of Federal Finance Ministry Decree No 37/1983, concerning invoicing and payments for deliveries for capital investment projects (with a planned impact of increasing inventories by Kcs 11.6 billion), the implementation of CSSR Government Resolution No 226/1983 regarding the assurance of smooth nuclear power plant construction (pre-deadline deliveries became evident in the plan as an increase of Kcs 0.3 billion), and the establishment of priority tasks in industrial and construction organizations (aimed at reducing inventories by Kcs 4.2 billion below the levels approved in the plan), and a program based on the weeding out of unutilized inventories.

Despite the fact that industrial organizations were unsuccessful in fulfilling their priority task (organizations of the Construction Ministry fulfilled theirs) and that these organizations overall exceeded planned inventory targets by some Kcs 5 billion, the above mentioned measures were instrumental in assuring that inventory increases in industry amounted only to Kcs 0.3 billion (they had been Kcs 1.6 billion in 1983).

A number of organizations in industry and construction, despite several favorable trends, failed to take advantage of all the possibilities for reducing the inventory availability requirements for the capital replacement process. In particular there has been little success in limiting the formation of new inventories while simultaneously making use of inventories accumulated in previous years. The plan projected the utilization of inventory reserves from previous years in the amount of Kcs 4 billion while building up inventories of items essential to the meeting of production targets in the amount of Kcs 3.8 billion. The established priority task required the further utilization of inventory reserves in the amount of Kcs 4.2 billion. In fact during 1984 Kcs 6.5 billion in inventories from previous years was used. This was offset, however, by the formation of new inventories in the amount of Kcs 6.9 billion.

Development of Public Services Consumption

The goals and objectives of expenditures on public services and amenities for the general public were successfully fulfilled in 1984, as shown in Table 7.

Comparisons with the performance of the previous year is to a certain extent distorted by the recalculation of wholesale prices valid as of 1 January 1984. In adjusted terms (after subtracting the price influences of 1984) noninvestment expenditures for public services and amenities increase by 2.9 percent over 1983, which amounts to an absolute growth of Kcs 4.32 billion. Investment expenditures transferred to the comparable price level declined by Kcs 0.92 billion in comparison with 1983 figures. The increase in overall expenditures on public services and amenities for the general public, expressed in an adjusted form, amounted to Kcs 3.40 billion, or 2.1 percent.

Table 7. (in billions of korunas)

	CSSR					
	Budget 1984	Actual 1984	Difference	Fulfillment %	Growth 84-83	Index 84/83
Noninvestment expenditures by budget-supported and self-supported organizations Total	152.02	154.34	+2.32	101.5	+6.56	104.4
Including: CSSR	1.02	0.90	-0.12	88.2	+0.17	123.3
CSR	102.36	103.95	+1.59	101.6	+4.19	104.2
SSR	48.64	49.49	+0.85	101.7	+2.20	104.7
Investment expenditures	15.07	15.70	+0.63	104.2	+0.70	104.7
Expenditures on public services and amenities for general public[a]	167.09	170.04	+2.95	101.8	+7.26	104.5
a) excluding Project Z						

The development of expenditures in the area of public consumption captures better than the absolute data the figure for "per capita noninvestment expenditures on public services and amenities for the general public." This figure increased by some Kcs 264 (102.8 percent) over the 1983 figure and reached Kcs 9,850.

The substantial resources expended for public services and amenities for the general population--these expenditures represent 49.7 percent of total budget expenditures--provided in 1984 for the implementation of demanding tasks in the area of social security, health care, education, cooperative housing construction, objectives in the area of culture and the activities of public organizations.

The successful fulfillment of planned tasks was, as in previous years, implemented through the use of special purpose and other resources transferred from the state budgets of the republics to national committee budgets during the course of the year and through the mobilization of internal, supplementary resources of the national committees. These internal, supplementary national committee resources cover roughly one tenth of total noninvestment expenditures on public services and amenities for the general public in the CSSR in 1984.

Conclusion

National economic development in 1984 built upon the basic positive trends of 1983. The implementation of the reoslutions of the 10th CPCZ Central Committee Plenum and the fulfillment of most of the priority tasks formulated by the CSSR Government to upgrade the state plan contributed to the maintenance of the economic growth rate from the previous year. This performance, along with plan tasks for 1985 provide concrete guarantees that the overall objectives and tasks of the Seventh 5-Year Plan will be met not only in the area of quantity, but especially in the area of qualitative indicators.

One of the positive aspects of national economic development is the fact that increases in national income is being achieved through the gradual implementation of economic intensification, greater efficiency, a reduction in transportation intensiveness and the improved utilization of internal capabilities. Greater resources assure a balance in our payment relationships with foreign partners, planned payments of loans and a reduction in our hard currency indebtedness, a further increase in work incomes, public and personal consumption and an increase in investment. As emphasized by the 12th CPCZ Central Committee Plenum, however, we cannot be satisfied with the performance of 1984 in economic development, nor should it be overestimated.

This is because during this period certain negative trends persisted from previous years and continue to retard the achievement of greater national economic efficiency. Among the most serious is the fact that R&D progress and innovative activity at the enterprise level has not yet become the main factor in the intensification of the economy. The technico-economic sophistication of a number of products and their quality, in spite of moderate improvements, continue to lag behind the current potential and requirements of the Czechoslovak economy. This is mainly evident in the low valuations of our products on the domestic market, as well as in international exchange, where the efficiency of our products has been on a continual decline. Labor productivity has, to be sure, increased, but more slowly than the capital asset per worker ratio has been increasing. Capital asset utilization has thus been worsening. Economically unjustified differences still exist in the managerial sophistication of specific organizations and branches, and planned tasks are not being completed comprehensively and evenhandedly. We continue to be unable to implement the needed structural changes or to adhere to desirable objectives in the utilization of output. This is especially true of deliveries designated for nonsocialist countries, deliveries for the domestic market, and capital deliveries. Most of the existing shortcomings stem from a continually unsatisfactory level of management, planning and control at all levels that far from corresponds to the difficulty of current tasks.

A CSSR Government report on the fulfillment of its program decree emphasized that to execute the strategy of the 16th CPCZ Congress it is essential to accelerate the process of economic intensification, more rapidly to improve the performance and effectiveness of the entire socio-political, state and managerial mechanisms, to carry structural changes further and substantially accelerate the implementation process for R&D findings. Financial agencies must also play their inevitable role in achieving cost savings, increasing return on investment and profits, improving management, improving the relationship between import and export prices, improve the efficiency of investments, inventories, etc. Only in this way can an effective contribution be made to fulfilling the tasks of the Seventh 5-Year Plan and to the formation of a favorable point of departure for the fulfillment of the tasks of the Eighth 5-Year Plan and the budgetary outlook for 1986-1990.

ECONOMY GERMAN DEMOCRATIC REPUBLIC

LABOR TASKS FORMULATED FOR INTEGRATED MANUFACTURING SYSTEMS

East Berlin SOZIALISTISCHE ARBEITSWISSENSCHAFT in German Vol 29, No 5, 1985 pp 340-50

[Second installment of the article on the same theme by Hans Eberhard Plath and Dieter Torke; for the first installment see pages 25-35 of East Europe Report EEI-85-080 15 Oct 85. Original title: "Concerning the Formation of Labor Tasks in the Projecting of Integrated Manufacturing Systems"]

[Text] The concept of project-related operations research for the analysis, evaluation and formulation of labor tasks in the projecting of integrated manufacturing systems has already been introduced[1]. Below are the results of some concrete projects which have been determined empirically. The investigative and formulative approach to be used in this regard is based on an iterative process which provides for a cyclical repetition of individual, methodical steps in which the synthesis of job functions and labor tasks is analyzed in accordance with the principle of complete activity structures.

Since the objective of this approach to the project is above all to control and prevent any possible risk factors, comparison projects in related technologies whenever possible were included in the investigation in addition to the projected and subsequently realized technology. The result was that, depending on the project in question, both simulations and analyses of actual situations were used.

1. Project and Job Functions

The project to be discussed here involves an integrated machine system for machining prismatic parts (housings) which must be inserted manually into the workpiece holder The machine system comprises five processing systems, each containing three or four machining centers (using CNC). In the case of the three Type A processing systems, the machining centers are interconnected by an automatic, oval-shaped workpiece magazine section with 18 storage slots. The workpieces enter and exit the system via rotating workpiece changers. Each processing system has a gripping and servicing station for gripping, resetting and releasing workpieces and fixtures (see Fig. 1).

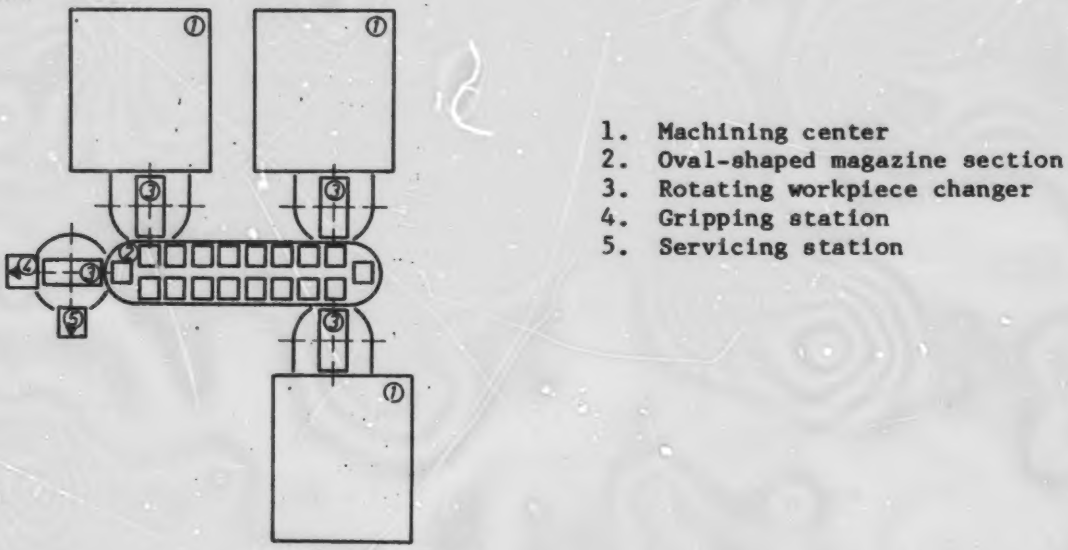

Fig. 1 Type A Processing System 1 (schematic drawing)

In the case of the two Type B processing systems, the machining centers are not interconnected by the magazines but rather by conveyor belts. The workpieces are machined using a computer-aided manufacturing process control system and are moved in and out via a centrally controlled storage and transportation system.

Of the numerous job functions related to the preparation, performance and assurance of production which are involved in this complex machine system, the gripping function was the initial subject of operations-research studies because, due to the way in which it fits into the system organization, it poses considerable problems in terms of task formulation. The existing gripping function, consisting of only a few elementary, manual operations, was considered the sole labor task for basic production workers by the project drawing office, whereas up to now these workers had been employed as highly qualified machining specialists.

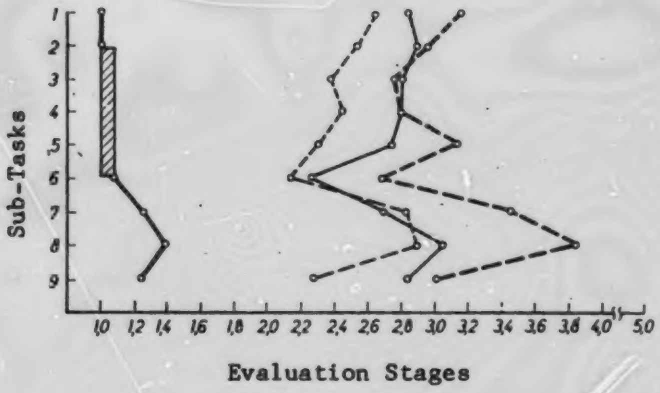
2. Evaluation of Rough Outline of Technological Project

In the iterative method, evaluating the rough outline of the technological project is the first step and is focused initially on the sub-functions to be performed by basic production workers. According to the investigative approach mentioned above, this step primarily involves estimating the probability of the incidence of risk factors (parameters to be excluded).[2] Some of the results obtained are given below.

2.1 Job Requirements

Job requirements were determined by means of simulation in the case of the projected technology and by means of actual analysis in the the case of comparison projects. Among other aspects, the following can be derived from the profiles compiled on the mental requirements (productive and reproductive)[3] which are assigned to the essential sub-tasks included in the work activities (see Fig. 2):

- If the job function of gripping becomes the sole task of the workers in accordance with the rough outline of the project, a restrictive requirement profile (dark, heavy line) is produced which is at a significantly lower level ($p < 0.01$) than was previously the case with other comparison projects, particularly in the case of the workers to be transferred (light, narrow line).
- The restrictions mentioned are the result of very deep divisions of labor. As a result, sub-tasks involving preparation for manufacture and containing aspects of planning and organization are not considered for basic production workers (shaded area).



Sub-Tasks:
1. Acceptance and clarification of labor contract
2. Preparation for machining of workpiece
3. Supplying, changing and checking tools
4. Supplying and changing gripping fixtures (and gripping first workpiece)
5. Checking the machining sequence (test cycle)
6. Operating the machine after setup
7. Monitoring of machine and workpiece machining process
8. Recognizing malfunctions and their causes
9. Post-machining activities

━━━ Gripping function corresponding to projected technology
——— Multiple machine operation in comparison projects (mach. tools, NC, CNC)
━ ━ ━ Operation of NC machines with low-level division of labor
– – – Machine operation in a running IGFA (representative curve segment)
▨ Not including sub-tasks 3 - 5

Fig. 2 Requirement Profiles for Sub-Tasks With Working Tools of Varying Levels of Automation and Degrees of Division of Labor

This discrepancy between requirements to date and future requirements, which is at the same time linked to insufficient utilization of existing qualifications or of qualitative labor assets, could lead to loss of performance, reliability and motivation as additional risk factors alongside dequalification risks.

2.2 Performance Sequence and Stress

Due to the limited availability of data from the project documents, the analysis of performance sequences was based initially on the relationships between active and "inactive" periods. These figures were recorded over a working shift and were determined by simulation in the case of the project technology and in real time in the case of the comparison projects. The results follow:

- In the case of the projected techology the number of active periods is significantly higher ($p < 0.05$) on the average and over the entire course of the shift than in the comparison projects in which the workers to be transferred had been employed up to that time.

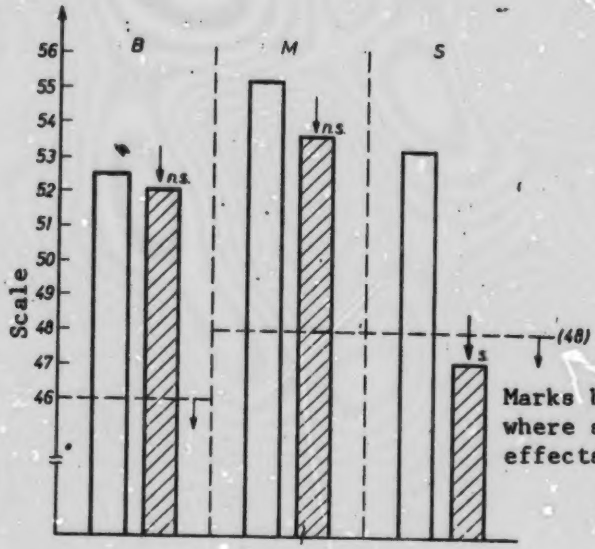
- Within the greater number of activity periods, not only are there fewer and more elementary manual operations to be performed than in the comparison projects, but they must also be repeated many more times and at much shorter intervals.

Therefore, it is clear that the risk factors to be considered include not only a one-sided view of the physical demands but also the implications[4] of negative psychological stress. The figures from the BMS questionnaire which was given to workers in the comparison projects indicate the following (see Fig. 3):

- In the case of the workers from the comparison projects who are to be obtained for the new production facility and who must currently meet higher quality requirements than those planned for them in the project, the scales for fatigue (B) and monotony (M) show only slight variations not considered critical.

- The scale for psychological saturation (S), however, shows a significant difference ($p < 0.05$) which also exceeds the critical limit. Therefore, clearly negative effects are already apparent in view of this degree of negative stress.

Thus, the following statement can probably be made: If job requirements which are comparatively more favorable already indicate negative effects, reduction of the requirements to suit the project can lead to substantial risks of undue stress which could be more extensive and comprehensive than is the case with workers in the comparison projects.



Marks beginning of area
where strong negative
effects are found

B: Fatiguing conditions
M: Monotonous conditions
S: Conditions of psychological saturation
EZ1 (Test Point 1: shortly after beginning of shift)
EZ2 (Test Point 2: shortly before end of shift)
n.s.: not significant
s. : significant ($\varphi < 0.05$)

Fig. 3 Figures from BMS Questionnaire for Determining Stress On Workers in Comparison Projects (n = 12)

2.3 Job Satisfaction

Data obtained from workers in the comparison projects for eight different areas of job satisfaction[5] indicate the following (see Fig. 4):

- Workers in the comparison projects exhibit clear satisfaction with fellow members of the work team and with the camaraderie and unity within the collective. This good social climate forms a very favorable basis in terms of personnel for collective types of labor organization. However, there is a probable risk of dissatisfaction in the social area when the specific labor organization planned for the project is realized.

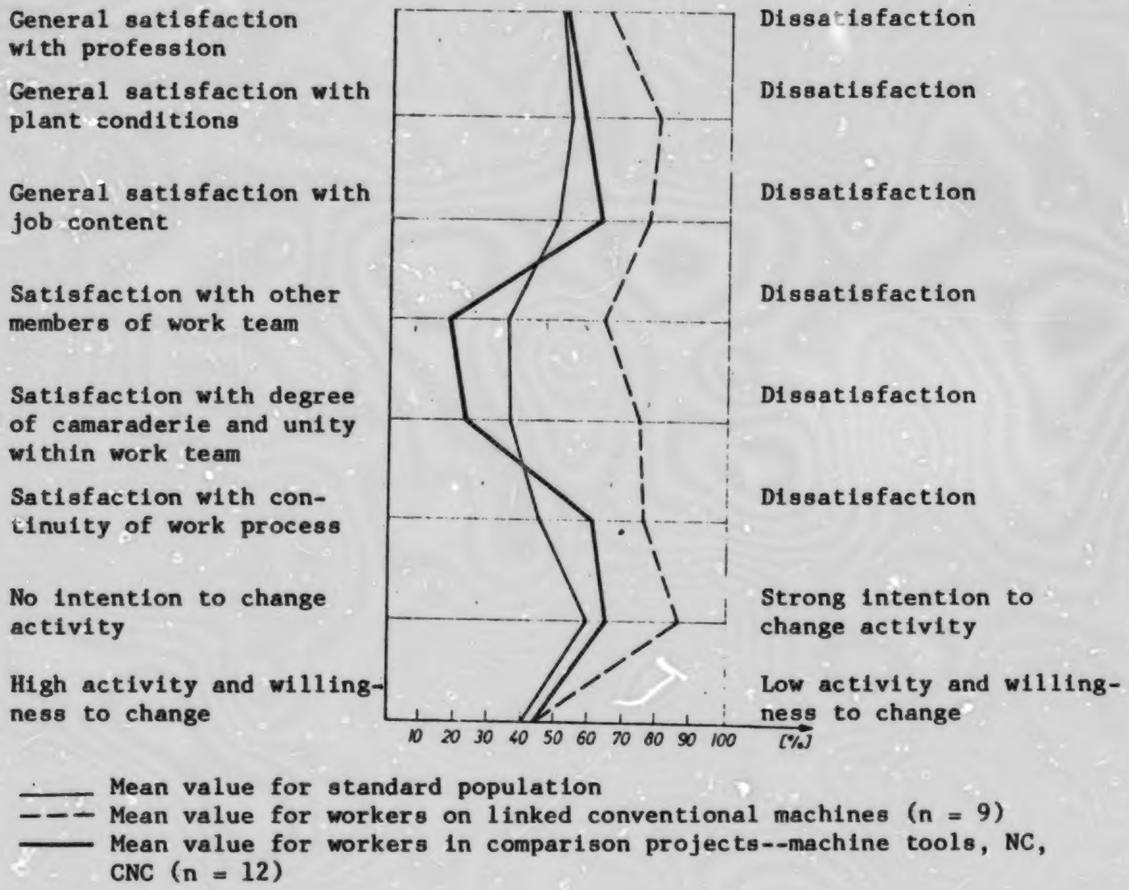


Fig. 4 Plotted Data

- Although the demands to be met in the comparison projects are relatively higher, there is already a clear trend toward dissatisfaction with job content, as well as a tendency to change activities. When the job requirements are reduced to just the gripping function, a general increase in the risk of job dissatisfaction and in the intention to change activities can be expected--similar to that encountered in work on linked conventional machines.

2.4 Worker Expectations Regarding Their Future Activity

In the questionnaire which has been developed[6], the basic concept is that worker expectations regarding their future activity are the determinants used in formulating jobs and especially in formulating specific tasks. Moreover, they provide information on the level required within the scope of formulating tasks aimed at a specific target group.

The figures obtained on the workers to be transferred are shown in Fig. 5 as the amount of emphasis on individual job characteristics in relation to the maximum possible emphasis. The shaded areas indicate the amount of divergence between emphasis on job characteristics as reflected by worker expectations and the gripping function as the sole labor task. Although it is not possible to go into detail here, the following is clear: For all of the characteristics, worker expectations regarding their future activity are substantially above the emphasis level for these characteristics ($p < 0.01$) which would result if gripping were the sole activity, even though the expectation levels themselves do not reach the maximum degree of emphasis. This could increase the probability of risks involving primarily undue stress, job dissatisfaction and lack of motivation.

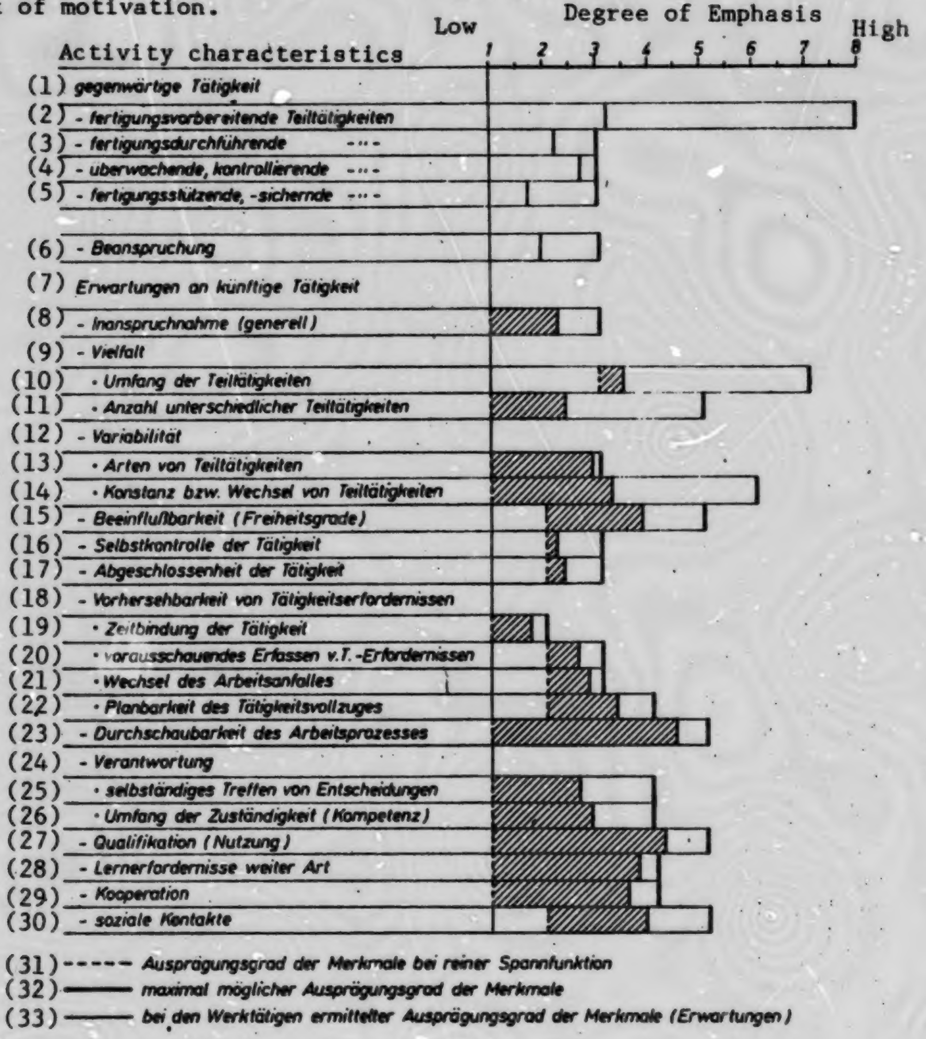

Fig. 5 Degree of Emphasis on Components of the Current Activity in Comparison Projects and on Worker Expectations Regarding the Quality of Their Future Activity in the Processing System (n = 12)

[Key on following page]

Key:

1. Current activity
2. - Sub-activities involving production preparation
3. - Sub-activities involving production performance
4. - Sub-activities involving monitoring, controls
5. - Sub-activities involving production support and assurance
6. - Stress
7. Expectations regarding future activity
8. - Utilization (general)
9. - Variety
10. • Scope of sub-activities
11. • Number of different sub-activities
12. - Variability
13. • Types of sub-activities
14. • Constancy/variability of sub-activities
15. - Influence (degree of freedom)
16. - Self-monitoring of activity
17. - Completeness of activity
18. - Predictability of activity requirements
19. • Time-dependent activity
20. • Predetermination of activity requirements
21. • Variation in work load
22. • Ability to plan activity process
23. - Clarity of labor process
24. - Responsibility
25. • Independent decision-making
26. • Scope of responsibility (competence)
27. - Qualification (utilization)
28. - Additional training requirements
29. - Cooperation
30. - Social contacts
31. Degree of emphasis on job characteristics in the case of a simple gripping function
32. Maximum possible degree of emphasis on job characteristics
33. Degree of emphasis on job characteristics (expectations) determined among workers

2.5 Process-Dynamic Time Response of Gripping Function During System Operation

The first tests on Type A processing systems were to see whether the documented utilization of the loading/unloading personnel of 50 percent of the overall gripping time per system was distributed over time such that the planned operation of two systems by one worker was possible. Simulations were employed for this purpose. The results are given below:

- The percentage of time per shift required for gripping is 65 percent and not 50 percent as calculated for the project.

- At the same time the overlapping periods involved in gripping requirements which occur simultaneously are considerable (see Fig. 6).

Thus, the planned type of labor organization involving two systems operated by one worker is not feasible because the large amount of idle time would present an unacceptable production risk.

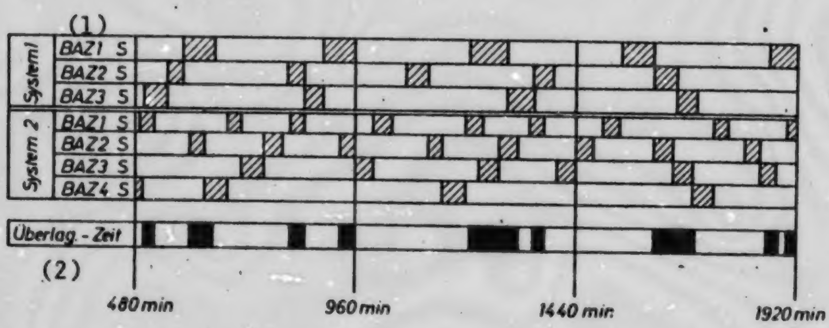

Fig. 6 Overlapping Time Periods Required for Gripping in Processing Systems 1 and 2 of Type A (S = gripping, determined by simulation)

Key: 1. Machining Center 2. Overlapping time periods

2.6 Consequences

With regard to basic management decisions, these and other results used in the analysis of the rough project outline led to the requirement for greater precision in the formulation of tasks and thus in accomplishment of those tasks by the workers, in the concept of wages and characteristic figures, and in workplace design.

Therefore, our primary concern was to largely eliminate the already known risk factors based on changes in the division of labor and in labor cooperation, in particular by combining job functions of varying content.

3. Reformulation of Labor Tasks

In accordance with the iterative process used in the project, the reformulation of labor tasks represents the second step in terms of a targeted and, moreover, controlled method of intervention with regard to the risk factors which have been determined.

Development of revised labor tasks intended first and foremost to produce a more favorable organizational integration of the gripping function was in accordance with the participation concept of collective development of solutions for formulation problems and included the test results shown here.

Among other things, an essential result of this process was a preparatory document on the reformulation of labor tasks which was approved by all involved. According to this document, the intention of the task formulation draft, which is oriented toward specific objectives, is to broaden labor tasks by combining manufacturing performance, preparation and assurance functions which are interlinked and interchangeable.

Accordingly, task structures were developed by integrating auxiliary processes into the main process. These task structures comprise three sets of tasks and include the following areas of operation: gripping the workpiece, tool setup and preadjustment, and setup and monitoring of the machine system. Table 1 provides a brief summary of task set I which applies to basic production workers.

Each of the three sets of tasks is similar to task set I and contains a priority task and additional sub-tasks in accordance with the basic ideas of Hartmann and Zink[8]. The additional sub-tasks comprise interlinked job functions which entail a considerable number of separate functions.

Table 1 Tasks and Job Functions in Task Set I

Tasks	Job Functions
Priority task	- Gripping the workpiece - Monitoring the main control panel
Additional sub-tasks	- Sub-tasks involving tool setup - Sub-tasks involving setup of the machine system - Sub-tasks involving monitoring of the machine system

The still open questions with regard to organization within the operating system are: According to what special principle of organization and to what degree in each case are the job functions able to be interlinked? Additional simulations and real-time analyses are required here in order to determine the frequency, duration and time-dependency of individual job functions.

4. Ability to Realize Complex Labor Tasks

The renewed labor analysis testing of more complex labor tasks planned for the project represents the third step in the iterative process and, corresponding to the current level of project preparation, uses simulation techniques. It is performed first and foremost with a view to priorities because we are dealing here primarily with the basic functions which must be assured.

What is to be determined, among other things, is the extent to which adequate time periods for the inclusion of additional job functions can be made available within the scope of the process-dynamic time structures possible within the manufacturing system, and whether it is feasible at the point in time required technologically. In addition, the reformulated labor tasks are to be evaluated in terms of the activities involved in the job functions to be combined.

Some examples of the time structure involving the machine functions and job functions of Type A processing systems are given below. The first analysis of the programs for computer-aided production control which were made available by the supplier of the working tools and which are part of the software which has been created indicated the following:

- The operational requirements which arise during one working shift are stochastic in nature and are interrupted by unforeseeable waiting periods of varying lengths.

- These waiting periods and/or the percentage of spare time are of particular interest in formulating more complex labor tasks. The frequency distribution of the duration of these periods shows, however, that their length is essentially only up to 5 minutes long (see Fig. 7).

- Taken individually, periods of spare time this small cannot be used in task formulation which intends additional functions, even though the overall percentage over the course of the shift is very high at about 35 percent.

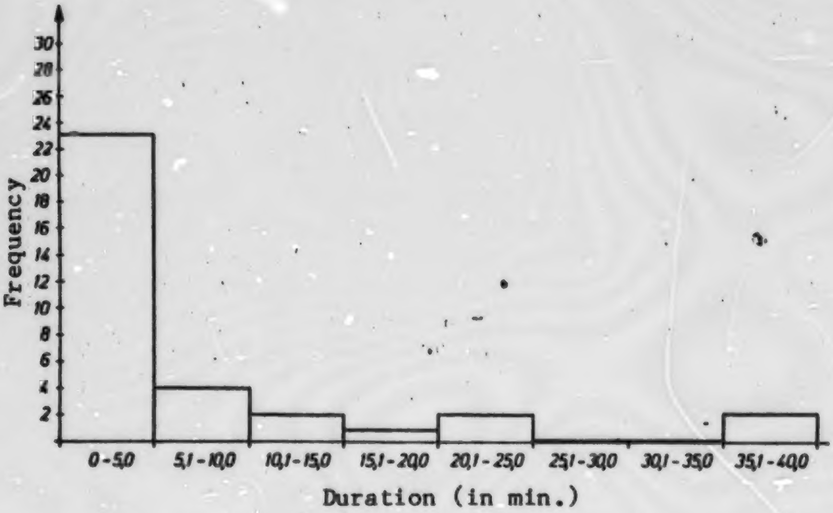

Fig. 7 Frequency Distribution of Waiting Periods of Varying Duration Per Shift in Type A Processing Systems (Determined through Simulation)

Therefore, an attempt was made to change the production process control programs through simulation in such a way that with equal utilization of the machining centers longer adjacent periods of spare time are created which are at the same time predictable. If the technological input parameters of "workpiece allocation," "number of palettes per workpiece," "machining sequence per machining center" and "point in time of entrance and exit of palettes" can be coordinated such that intermediate storage time reaches a maximum, the small individual periods of spare time are substantially increased through bunching.

As indicated above, production process control programs can certainly be developed which correspond to the requirements and expectations mentioned (see Fig. 8).

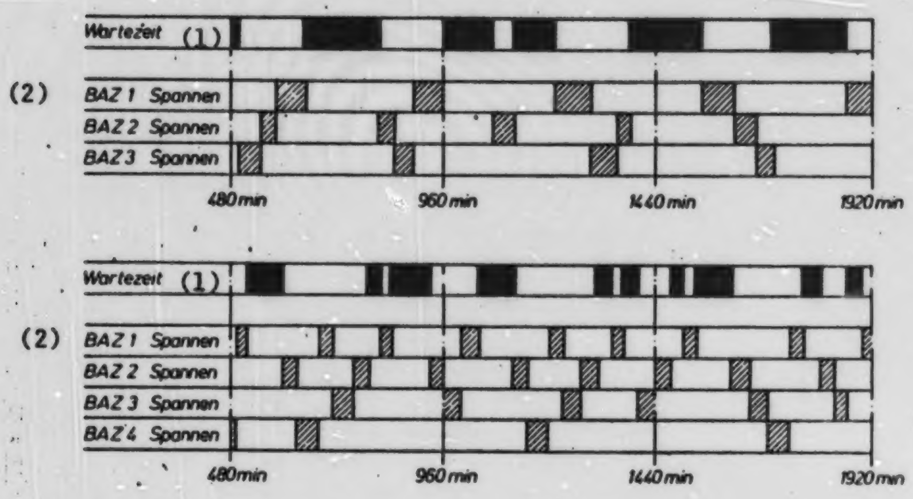

Fig. 8 Simulated Process-Dynamic Structure of Gripping Requirements and Spare Time Periods in Type A Processing Systems 1 and 2

Key: 1. Waiting time 2. BAZ = machining center; Spannen = gripping

By optimizing the technological input parameters indicated above, the operational requirements for both 3 and 4 machining centers per processing system can be scheduled (shaded areas) such that substantially longer adjacent blocks of spare time per shift are created (black areas).

This temporary separation of man from machine, made possible by the way in which the software is formulated, lays the groundwork for the planned formulation of labor tasks with more content by combining and therefore expanding job functions.

The time/content and function-related structuring of the three above-mentioned sets of tasks in keeping with the requirements or possibilities available in operating the system, and the activity-based evaluation of the job functions to be combined with a view to preventing risk factors, are an integral part of further project-related operations research.

Subsequent published reports will therefore deal among other things with simulation-based investigations of time-dynamic process structures in processing systems taking into account additional job functions and results for the purpose of verifying task structuring in a plant's operational phase. The objective here is to fully implement all possibilities of socialist job formulation in such a way that risk factors are eliminated by means of an orientation toward the important objectives of increased performance, personal growth and stress optimization.

VALOSAG ARTICLE ON COORDINATION OF NATIONAL ECONOMIES

Budapest HETI VILAGGAZDASAG in Hungarian No 46 Nov 85 p 57

[Article from VALOSAG No 10, 1985 by Laszlo Csaba: "Synchronization of Interests and Joint Search for Solutions"]

[Text] "It is obvious that the CEMA countries--in part a result of the weakness of the foreign trade concept and as a consequence of the subservient (service and natural gap-filling) role played by foreign trade in planning--have not succeeded in eliminating the parallels in structural policy with the help of the international effort to synchronize their planning. This does not at all justify the lack of actual coordination," the author points out in his article, which appeared with the subtitle "Thoughts On the Coordination of National Economic Policies."

The author sees one of the major causes for this apparent lack of organization in the fact that "in this system of mutual dependencies and varying institutions, the relationships between (economic) directing levels, between leaders and those led aren't relationships between equal partners, ones which can be described as theoretical games, but rather the hierarchical character of the organizational and institutional system has a determining role." Among other things, this also means that "in actual East European planned economies the role of the market so far has remained auxiliary, and the decisive standard for economic success was not the satisfaction of the co-equal partner, but rather that of the superior authority."

According to the author, the opinion is widely held that it is not possible to coordinate the economic policies of the individual countries within the CEMA, since the national goals of the individual countries differ sharply, as do the national economic mechanisms. The author adds, however, that this does not justify the maintenance of parallel structures, because "economic literature has already proven that as early as the 1950s and 1960s the common strains in the economic mechanisms of the CEMA countries--such as their internally directed, "sovereign", autarchical and non-monetary nature, their organizational differences developed primarily for subjective reasons in the financial system--hindered the development of regional economic cooperation." Among other factors, the lack of a well-functioning regional market hindered "the effective coordination of national priorities which differed out of necessity."

The exchange of commodities within the CEMA is primarily--and to an increasing degree--controlled by a medium-range planning coordination executed with essentially unchanged methods. When plans for 1986-1990 were coordinated, it became evident that because of the insufficient marketability and low technological level of commodities, as well as for economic reasons, it would be unrealistic to count on an expansion of the CEMA's commodity trade. Nor are the traditional methods of planning coordination helpful in stabilizing the growth of trade, even though that is supposed to be the main function of coordination. As the author states, in our time, when technological progress and product development is so swift, it is impossible to expect the detailed and reliable foresight which is called for by traditional planning methods. "The methodology of planning coordination continues to ignore the above-mentioned objective limitations on planning foresight," he writes, "and, instead, strives to add stability to the planning processes, employing its own resources. It is not surprising that attempts of this type bring even less success than has been our past experience: the coordination of planning is significantly behind schedule, whether measured by the timetable approved at the 1982 annual session [of the CEMA], or as compared to its own established norm.

POSTAL SERVICE IN NEED OF FUNDS, EQUIPMENT

Budapest MAGYAR HIRLAP in Hungarian 24 Dec 85 p 5

[Agoston Braun's interview with Illes Toth, president of the Hungarian Postal Service: "The Raven Flies with Crippled Wings"]

[Text] Our relationship with the postal service is more binding than a marriage. For, after all, no matter how much we curse "the raven," we cannot become independent of it. So we can only hope that sometime in the future the postal service will improve, and we will have less reason to complain. This possibility is the topic of our converstaion with Illes Toth, the president of the Hungarian Postal Service.

Illes Toth was born in 1926. He studied in the department of electrical engineering at the Budapest Technical University and received his diploma as an electrical engineer. He earned a diploma from the Higher Party School of the HSWP. Initially he worked as an independent party functionary; later he became the technical director, then the deputy director of the Orion Radio and Electronics Enterprise. Since 1970 he has been the first deputy to the director, later the director, of the Hungarian Postal Service. Presently he is president of the Hungarian Postal Service, with the rank of secretary of state.

[Question] I have heard economists making the claim that the price of our economic policies during the earlier decades has been, among other things, that in the interest of dynamic growth in production the development of the infrastructure, such as that of the postal service, has been neglected. What is your opinion concerning this?

[Answer] I'm glad that your first question was not concerning the telephone situation. I am even gladder, because in the areas of classical postal services we could please the public for much less money, say for about 3-4 billion forints, than in the area of telephone service, where such an amount is barely noticeable. For example, for 800 million forints we could expand the reception possibilities of television's channel 2 from 80 to 100 percent, or for the same amount we could introduce the practice of postal savings accounts. The latter would mean that the citizen could pick up his deposited money at any post office in the country, instead of being limited to the one where he made the deposit. Presently, this practice is made impossible by the fact that there is no record of the money outside the place of deposit.

The conflict between the productive sphere and the infrastructure has been increasingly tense for the past 20-25 years. During recent years they began to consider us--at least in theory--in our proper place. Unfortunately, the financing is still not what it should be. Therefore, we feel that the postal service has not received its proper share of the national development. For example, in the period between 1970 and 1980 we received 1.5-2.1 percent of the socialist sectors's investments, even though international data indicate that the dynamic development of postal and telecommunication services requires at least 4 percent.

[Question] It has been two and a half years since the Postal Service and the Ministry of Transportation have become separate organizations. Are you beginning to notice the fruits of independence?

[Answer] It was in the midst of the Sixth 5-Year Plan, during the years of belt-tightening, in a difficult situation, that we had to decide whether or not we wanted to accept independence. We decided in favor of separation, in spite of the fact that in two important areas, development and postal wage increases, we could not make any promises. We were confident that, if not sooner, at least by the Seventh 5-Year Plan, we could create the foundations for our future. These days, it appears that our hopes are starting to come true. We have acquired useful experience in the interim years, not only in our own opinion, but in that of the other organizations that work side by side with the Postal Service. The Council of Ministers recently evaluated the lessons of having an independent Hungarian Postal Service. I can sum these up this way: The reorganization of the postal service into an independent body took place according to schedule and essentially without difficulties. Our system of contacts has become simpler, quicker and more effective, domestically as well as on the international scene. The prestige of our organization has been enhanced in every respect.

[Question] Everyone prepares a year-end evaluation. If I would have to talk about the popularity index of the postal service, I would be quite embarrassed, because the manifestations are so extreme. The approximately 70,000 workers of the Hungarian Postal Service, who are not aided by modern technology, and whose working conditions are often far from ideal, are burdened by the constantly growing, and sometimes justified, impatience of the population.

[Answer] This is a very timely and important issue, which occupies our attention, too. According to our own data and the nationwide survey of public oppinion completed in 1983, mail delivery and the services connected to the delivery of packages and money orders are considered good or satisfactory by our clients. Naturally, from time to time it becomes necessary to examine the opinion of the public concerning postal services, and to compare the results with our own claims. For this reason, we are going to conduct another nationwide public opinion survey in 1986. In any event, I feel that, considering the volume of traffic--more than 780 million letters, 50 million registered items, 24 million pension checks and 11 million packages--this organization performs its job decently. However, due to shortcomings in the service, valid complaints come in from a wide variety of sources. Some of these are caused by objective factors of our circumstances, while others are attributable to our own faults.

I would also like to recount an average day in the life of the postal service: The mail trains take off around midnight, in 9 directions, and take with them approximately 30,000 packages, 1.3 million letters, 2.2 million copies of publications. During the dawn hours, the mail trains are met by 320 postal trucks at various points, in order to deliver the items to the 3,200 post offices around the country. And this early morning.... No matter how I figure it, we are in direct, or close indirect, contact with 4 million clients each day. The work outlined above must be accomplished every day.

As for the telephone service, few people are aware of the fact that the systems operating in cities such as Balassagyarmat, Esztergom, Komarom, in a total of 231 communities, are based on manual connection, many of these were installed around the turn of the century, and that these systems serve some 47,000 subscribers. The situation is not much better with the other important element of the telephone sevice, the cable network. This is classified into five categories, according to technical condition: This means that cables in category IV should be replaced immediately, while those in category V should have been replaced earlier. Well, in Budapest almost 45 percent of the cables are in categories IV and V ! There are 460,000 people in this country awaiting the installation of their telephones, and perhaps I do not need to tell you what kind of tension this creates. On the other hand, it is commonly known that in certain locations we were able to provide opportunities for the population to purchase bonds, thus in fact providing the money we could use to speed up improvement of the telephone systems. I can tell you that, with one or two exceptions, these bonds were sold out in one week. In Debrecen, for example, we had to expand our planned switchboard from 2,000 to 6,000, because three times as many people purchased bonds as expected.

In the final analysis, our aim is to live up to the traditions of the Hungarian Post Office, which used to be world famous for its quick, accurate and reliable service. It is the policy of the leadership of the Hungarian Postal Service to make the organization innovative and open to contact with the public, and to do this in such a manner that the institutional face of the Postal Service be the least evident. In this effort we have already accomplished a few things. For example, we participate in the distribution and popularization of books, we deliver medication to small villages where there are no pharmacies, and we operate public telephones on the honor system, from which our clients can send telegrams or talk for 6 minutes, and pay later. For our employees, we conduct courses in polite behavior, and even if many of them forget what they have learned in these, they never treat clients the way they used to.

[Question] We would welcome your views on something else: Are you satisfied with the esteem in which the public holds postal employees?

[Answer] Regrettably, we have not achieved our proper status yet. We are not recognized in accordance with the work we perform. Every day, 20,000 of my colleagues work in the snow, in freezing weather, in rain, in mud, literally on the street. 8,000 of our workers are permanently assigned to rotating shift work. Our conditions are such that we are unable to offer institutional eating facilities to one out of every three of our employees. In a nationwide comparison two years ago, each month postal employees took home 380 forints less than if they performed similar tasks in other areas, and last year this difference grew to 440 forints. For those who work behind the windows, who have to smile in addition to working, the comparison shows a 1,000 forints deficit. Naturally, we made every effort to come closer to the national average. For example, in 1985 postal workers received a 10 percent wage increase, and our prospects for 1986 are also promising. One result of the above-mentioned problems is that we are suffering from a shortage of workers. In many areas, primarily in the technical, but also in the delivery trades, shortages of personnel have become permanent, especially in the cities and in the trades most in demand. For example, we could immediately provide work for 850 telephone maintenance technicians.

[Question] There are admirable developmental concepts in connection with classical postal services; items classified as express mail can reach their Western destinations in the same amount of time as it takes--optimally--to deliver something from one community to another domestically. What kind of realistic plans do you have for shortening domestic as well as international delivery time, which is often intolerably long?

[Answer] Each day, the postal service expedites 5-6 million items. A significant portion of these arrive at their designated destination in time. Due to transportation problems--delayed trains, weather problems, fog--the processing time may be longer at times, and occasionally there are pileups in the local offices as well. Regrettably, there are still problems with the mechanization of mail processing, and I have already mentioned the shortage of labor. What are our plans, you ask? During the Seventh 5-Year Plan we will continue developing the network of mechanized mail processing stations, along with the realization of the so-called central points program. (These regional centers will significantly simplify the task of postal workers and shorten the time of delivery.) We will complete the center at Szekesfehervar and begin constructing the centers at Kecskemet and Pecs. We will continue the mechanization of mail processing in Budapest, Szekesfehervar and Szolnok. And, last but not least, we will replace a significant portion of the vehicles in our network of mobile post offices.

I would also like to announce that the Postal Service has a developmental concept extending to the year 2000. We defined the developmental concepts in 1979, based upon expected demands. In other words, we know what people will expect of us around the millenium, and what kind of personal and technical preparation will be required in order to satisfy these demands. Of course, I must tell you that planning is not so simple. Nowadays, we have numerous large-capacity and lightning-fast means for transmitting information, from communication satellites to electronic equipment. In spite of this, people prefer that their personal messages reach the adressee while preserving their personal traits. In other words, it makes a difference whether one receives the same intimate message written on a familiar-smelling pink stationery or relayed by a communications satellite. The annual 2-3 percent growth in traditional letter traffic is a world-wide phenomenon, and we must also be prepared for this.

I must add, however, that, regrettably, the Hungarian Postal Service is not a large enough customer for Hungarian industries to economically produce machinery for it, and we cannot obtain suitable equipment from the friendly socialist countries. We must recognize that the only way we can modernize is if we purchase entire lines of equipment from the West. This has its disadvantage in that we must spend hard currency; what is more, once we commit ourselves to the products of one firm, later we cannot switch as we would wish. We must accept this sacrifice, because otherwise there will never be a rapid and modern postal service in Hungary.

[Question] I would like to recall one of your recent public appearances. During the press conference concerning the telephone bonds, you announced to the newsmen present: "We would make a compact with the devil, if that would give us a chance to improve the telephone situation." In spite of the fact that the so-called COCOM list continues to prevent the import of the most modern electronic technology, real change will depend on this: Will we have enough money or not?

[Answer] As for the technical part of the question, indeed, embargoes prevent us from stepping up the pace of making our switchboards electronic. However, this is only one, and not necessarily basic, condition for the more rapid development of telecommunications. There is no denying, an electronic switchboard center consumes 40 percent less electricity than the crossbar system; it calls for a smaller building, and it is cheaper in every detail. Since it has no moving parts, it can even be considered to last forever. It is also true that the concept of crossbar switchboards is 40 years old, but it is still suitable for the support of a good nationwide network. There are a sufficient number of domestically manufactured parts that would be suitable for more rapid development. The question is, what pace can we establish; thus further development will be connected to investment resources. The telephone service is a profitable enterprise in Hungary too, but the Postal Service has to make contributions to the great public investments, such as public health or education, and therefore there is no possibility for us to spend more money on the expansion of service.

In order to realize the telecommunications development program during the Seventh 5-Year Plan, a project we consider absolutely necessary, a minimum of 40 billion forints must be spent. At this time, such an amount is not at our disposal, so we strive to use any outside resource that could contribute to development. Of course, we can only accept money if we can promise improvement in the quality, or at least the quantity, of service. Thus, the acceptance of money implies--among other things--responsibilities for us. In an effort to improve our situation, we are negotiating with the World Bank, and we are otherwise surveying the global money market in search of loans. In addition, the postal service also investigates the possibilities for involving domestic entrepreneurs ("stockholders") or foreign capital in the development of the country's telephone network. This presents a radical break with traditional practices. Finally, I must point out that, just as everywhere else, in Hungary too there is a trend toward making the various services self-sufficient and achieving the point where profits from the telephone service support the development of the network.

In other countries, there are switchboards as smart as computers. One punches in a code from his place of employment in order to turn on the heat in his home; or there are phones that forward important calls to the residence of one's friends where one is visiting. As my biography reveals, I am going to be 60 years old next year: I would like to be alive when we can use phones like these in Hungary!

ENTERPRISE RESTRUCTURING NO SUBSTITUTE FOR MARKET

Budapest FIGYELO in Hungarian No 2, 9 Jan 86 pp 1, 6

[Article by Istvan Csillag: "Enterprise Restructuring: "Only the Market Is Missing"]

[Text] Since 1980 nearly 600 new enterprises have been formed. About 400 independent and approximately 200 subsidiaries have been established. This is undoubtedly good news, but the pathological absence of small and mid-size companies (with an employee size of 100-500) is still typical. Thirty percent of all entrepreneurs in industry in the socialist sector still have personnel in excess of 2,000. Decentralization has so far strengthened primarily large companies and has reduced personnel only in giant companies. In spite of decentralization, examining the 460 main product groups of Hungarian economy we cannot find one in which the market share of the largest manufacturer is below 51 percent, and there are very few in which the combined market share of the two largest manufacturers does not reach 75 percent. Except for the chemical industry, this market share can hardly be justified by profitable enterprise sizes or the concentration of capital to meet the demands of international competition.

Of particular concern is the overcentralization of enterprise structures if we consider that individual enterprises combine on the average 6 plants, each with a personnel of 300, which means -- with some exceptions -- that they were created from as many independent enterprises.

In the '80s management bodies examined the market conditions of 16 branches; they focused on the production of consumer goods. They analyzed the structure, management and market position of more than 120 enterprises. Of them 70 have a higher than 60 percent market share in their own product group.

Slim Results

Considering all things, restructuring seemed possible for about 40 enterprises and the government handed this task over to the affected enterprises.

The essense of arguments against decentralization was that an expanded supply was needed to stay competitive. And for this, more import, investment, turnover capital, etc. were needed. Companies emphasized that one could hardly expect expanded supply from breaking up enterprises. In a deficiency economy demand will exhaust supply, and competition will be restricted by price fixing, limited supply of raw material and administrative decisions on company profiles. Among others, it was also in response to these arguments that the complex study of organizational restructuring was augmented by a number of forward-looking "supplementary" measures. Some examples are the loosening of administrative restrictions on profile changes, the establishment of unity among various functions (trade, production,) and the formation of the trading house model. However, it also became clear that the government could not make up for the lost capacities of enterprises earmarked for "amputation;" it was only able to give some help (for instance, in the form of periodic tax exemptions) to the new unit created through separation. This is why the original organizational measures became more "flexible," saying that if the government could not provide anaesthetic, let enterprises perform the surgery on themselves. So it is natural that the date of the surgery kept being postponed, and the sphere of intervention was gradually diminished as an increasing number of obstacles--endangering export responsibilities and the unified policy of technology and development; lack of necessary occupational knowledge; low level of implements, etc. --could be discovered. In the end, these arguments could substantially slow down organizational restructuring.

The Tactic of Those Splitting Off

But we have to see it clearly: overcentralization and organizational monopoly preclude competition, and in this way the government can become dependent on monopolies. If state management stakes everything on one card--in technical development, export, etc.--then the risk in the radical changes affecting several sub-branches is too high. Considering all this it is no accident that in time enterprises and their directorates will share the same interests. As Gabor Karsai put it in the 1985/47 issue of FIGYELO: team play will be developed between large enterprises and their directorates. We can see that for many the establishment of a few subsidiaries means that the urgent and public task of market building can be "checked off."

Looking back at the period of organizational restructuring between 1980 and 1985 we can say that although centralization has been loosened, with the exception of a few branches, we still have not created the organizational conditions of competition (no mention will be made here of other conditions of market building.) Perhaps considering more the difficulties and necessary conditions for market building we could have achieved greater changes and avoided the frequently heard opinion that the weaker first quarter industrial production is due to organizational restructuring. It is true, though, that this can be convincingly refuted by the example of the food stuffs industry and by enterprise analyses as well. (See Janos Deak's article in the 1985/I 3rd issue of FIGYELO.) But it does not hurt to emphasize over and over again that there is no connection between organizational restructuring and poor production. Moreover, in the case of several small enterprises, they have to struggle to survive. But the one big enterprise can wait, saying something might happen to it; in the form of state care.

Table I. ORGANIZATIONAL RESTRUCTURING OF INDUSTRIAL ENTERPRISES 1985

Nature of Organizational Examinations	No. of Affected Enterprises	New Independent Enterprises	Subsidiary	Subsidiary Being Formed
-- Complex Examination of Market Conditions	69	1	12	20

ENTERPRISE COUNCILS APT TO RETARD DECENTRALIZATION

Budapest FIGYELO in Hungarian No 2, 9 Jan 86 p 6

[Article by Iag: "Independents and Subsidiaries"]

[Text] Contrary to general expectations, the main source of market building and organizational restructuring was the independence initiatives of organizational units within enterprises. In previous years enterprise units dared voice such requests only occasionally. They were wary of enterprise and ministerial management. With the introduction of new enterprise management forms, however, dependence on management organs and the director's power have been weakened, and unit leaders could feel the collectives' support manifested at workers' meetings. And the Finance Ministry's decree on financial help needed to become independent has increased their feeling of security.

Most initiatives--45--came from industry, and generally from units of enterprises that earlier had been earmarked for restructuring. The initiatives, however, had been aborted because of the information given by the enterprise headquarters or the founder. At the same time it is surprising how few units have initiated their independence. The approximately 900 enterprises under the ministry have more than 4,000 plants. And cooperation among the enterprises' units has been seriously blocked in many places.

Although initiatives to become independent have been in general well-founded, they have resulted in the formation of independent enterprises only partially. The decisionmakers had to consider the risk of organizational restructuring. Many leaders of internal units have been relieved of their duties after the rejection of initiatives, clearly indicating that the law and financial help do not protect those initiating changes, and there are no guarantees to safeguard the position of those who seek changes or of the organization itself. This is why the necessity of adding to the law has surfaced.

An important experience in restructuring so far has been that the issue of whether to become totally independent or to choose the controversial form of subsidy will inevitably come up. There is a need for transitional forms. Why? Because the interest of the parent company, relieved of the everyday concerns of running the business, extends to counting on the initiatives of its subsidiary, and on the extra profit that the parent company will enjoy as well. But the establishing company is legally responsible for its subsidiary, therefore it rightfully wants to limit risks to a reasonable degree, including the right to close down the subsidiary at any time. And since the liquidation of the subsidiary is not tied to conditions, it is possible that the founder would want to close down the successfully operating subsidiary because it needs the capital tied down in the subsidiary, or because the subsidiary poses competition.

What kinds of guarantees do subsidies have that--yielding to the "gentle force" of management bodies--were established by some parent companies in order to sidestep the initiatives to become totally independent? The question is justified. This is what led to a proposal that wishes to create new versions of the subsidiary form. Its essence is that the parent company is liable for the responsibilities of the subsidiary only to the extent of the invested capital, and the subsidiary could be liquidated only in the proportion of the invested capital and under certain circumstances.

Proposals to regulate initiatives to make internal units independent are also aimed at making organizational restructuring easier. This seems all the more important as in the future initiatives toward internal independence will be decided upon by enterprise councils, and general and delegate assemblies. Only units of enterprises under state management will be able to turn to the establishing organ. Since decisions are the organs' internal matter we can expect that the process of organizational modernization will slow down even further, as why would the enterprise council let efficient, self-reliant units become independent, and why would a weaker unit want to lose its protection?

Table I.

BRIEFS

ECONOMIC TALKS WITH SOVIET AMBASSADOR--Vice Premier Wladyslaw Gwiazda met with Vladimir Brovikov, the newly appointed Soviet ambassador to Poland. They touched on the main issues concerning Polish-Soviet economic cooperation and trade. On 5 February 1986, Andrzej Wojcik, minister of Foreign Trade, met with the Soviet ambassador to discuss Polish-Soviet economic and trade relations including questions concerning the trade protocol for this year and the agreement for economic cooperation between the two countries in 1986-90. [Text] [Warsaw TRYBUNA LUDU in Polish 6 Feb 86 p 2] /8918

JOINT VENTURES WITH USSR--The next in a series of meetings of the government body for the development of economic ties with the USSR, headed by Franciszek Kubiczek, first deputy chairman of the Planning Commission of the Council of Ministers, was held in the Planning Commission. The subject of the meeting concerned Polish-Soviet cooperation in the creation of Polish-Soviet joint ventures in industry and Soviet credit allocations for the development of production capacity in Poland. [Text] [Warsaw ZYCIE WARSZAWY in Polish 7 Feb 86 p 2] /8918

MINING INDUSTRY TECHNOLOGY--A meeting of the scientific-technical council for mining in the Ministry of Mining and Energy was devoted to discussing the directions and forms of control over research and technical advances in the mining of lignite and bituminous coal in 1986-90 and the principles of financing research activity and also questions of a legal and organizational nature in R&D offices. The council praised the contributions of research and development institutions to the growth of the coal industry and the work they have done geared to further improving the organization and efficiency of the work of these offices and also analyzed the realization of the economic management plan of the Lublin coal basin based on the verified models of the "Bogdanek" and "Stefanow" mines and heard the opinions of experts on this matter. The meeting was led by Jerzy Nawrocki, member of the Council of State. Czeslaw Piotrowski, minister of Mining and Energy, also took part. [Text] [Warsaw ZYCIE WARSZAWY in Polish 7 Feb 86 p 2] /8918

TRADE SCHOOLS DISCUSS REFORM--A national meeting of nearly 300 secretaries of trade school basic party organizations took place in the Party Training Center. They discussed the functioning of trade schools within the framework of economic reform. Also discussed were the tasks set before this very important educational organ arising from the resolutions made at the 24th Plenum of the PZPR

CC. Representatives from the Ministry of Education, the national board of the Union of Polish Teachers and the PZPR CC Department of Science, Education and Scientific and Technical Progress took part in the seminar. Joanna Michalowska-Gumowska, minister of Education, and Boguslaw Kedzia, head of the PZPR CC Department of Science, Education and Scientific and Technical Progress met with the seminar participants. [Text] [Warsaw TRYBUNA LUDU in Polish 8-9 Feb 86 p 2] /8918

KOSZALIN EXPORT PROSPECTS--A conference to discuss the potential and conditions for the development of exports in the Koszalin voivod was held on 13 February 1986 at the "Kazel" electronics industry plants in Koszalin. Vice Premier Wl. Gwiazda, members of the Planning Commission board, and representatives of voivodship party and administration leadership took part in the conference. Vice Premier Gwiazda met with the voivodship party and administration leadership on the same day. They discussed the social and economic problems of the region. [Text] [Warsaw TRYBUNA LUDU in Polish 14 Feb 86 p 2] /8918

SOVIET 'DRY PORT' TRANSSHIPMENT--Over 50,000 tons of lumber, more than 65,000 tons of fertilizer (potassium chloride) and nearly 32,000 tons of petroleum products to satisfy the needs of the Polish economy came into the country from the USSR in January 1986 via the transshipment station near the border at Dorohusk. In addition, over 500 tons of Soviet seedstock was supplied to Polish farmers in January by this route. Lively traffic through this railway "dry port" can be seen in February as well. About 6,000 tons of goods are transshipped here every day. [Text] [Warsaw TRYBUNA LUDU in Polish 15-16 Feb 86 p 1] /8918

BYELORUSSIAN COOPERATION IN FORESTRY--Representatives of the Byelorussian SSR Ministry of Forestry along with Minister Georgiy Markowski visited Poland on the invitation of the Ministry of Agriculture, Forestry and Food Economy. Programs for scientific and technical cooperation in 1986 were defined and a draft for a bilateral agreement on scientific and technical cooperation in 1986-90 was agreed upon. Subjects of joint R&D porjects included the problem of the harmful effects of industrial pollution on forest ecology and the development and implementation of effective biological means to deal with the harmful emissions. They also touched upon the question of cooperation in the production and supply of machinery needed by both countries for forestry work. A communique was signed on 15 February 1986 by Zbigniew Nocznicki, secretary of state in the Ministry of Agriculture, Forestry and Food Economy and by Minister Georgiy Markowski. USE OF GEOTHERMAL ENERGY EXPLORED

Bucharest REVISTA ECONOMICA in Romanian No 43, 25 Oct 85 pp 4-5

/Article by Prof Dr Oprea Parpala: "Geothermal Energy. A Local Resource in the Energy System of Romania's Agriculture"/

/Text/ In a period when natural energy resources are diminishing and there can no longer be any question of alternative energy because all forms of energy are becoming essential, the earth's heat as a primary and inexhaustible energy source can help to make up the energy balance in agriculture, especially since Romanian has "hot points" in the form of geothermal waters heated in the "furnace" of fossilized nuclear energy left from the gradual decomposition of radioactive elements in the course of the earth's aging.

Characteristics and Reserves of Geothermal Energy

Since geothermal energy is fed constantly by the flow of heat from the earth's core, it is renewable like the biomass, for example. But just as the biomass is renewable periodically, after one production cycle, so does exploitation of geothermal energy have to be interrupted periodically, if the exploitation flow is faster than that of the supply, for a period long enough for the energy reserve in the subsoil to be replenished.

"Hidden" in the earth's crust, geothermal energy must be brought to the surface in sufficient quantity and under strict technical control. Because of that characteristic, exploitation of geothermal energy requires tap drillings and transmission via a heat-transfer fluid.

As distinguished from other energy sources, geothermal energy has the advantage of actually requiring no storage system because the heat is stored by the geologic stratum itself from which the fluid is extracted by drilling. Furthermore geothermal energy can be produced at any time it is required.

But as a result most of the cost of this energy is in the fixed production costs, so that the commercial profitability of the investments in this field depends upon operation of the installations as closely as possible to their optimal productive capacity.

In Romania (4), Bihor County along with the other western counties of Arad, Satu Mare and Timis make up an area rich in geothermal waters, with temperatures up to 130°. The prospecting that was done indicated that a daily volume of 400,000 cubic meters could be expected, at temperatures of 50-100°. Within a variation of 35°, 14,000 gram calories can be obtained daily, or the equivalent of 2,000 tons of liquid fuel. It is estimated that the operable reserves of geothermal water incorporate a potential saving of about 1.5 million tons of conventional fuel, while only a 30th of that amount is being used today.

But the geologic prospecting indicated that there may be an abundance of hydrothermal deposits outside the western area, in the Olt Valley, the Southern Carpathians and Dobrogea. Yet it is estimated that by the year 2000 hydrothermal energy will provide 0.5 percent of Romania's energy supply at most. (5)

Uses of Geothermal Energy in Agriculture

Since ancient times man has used warm springs either for baths or directly to cook food. In medieval Europe thermal waters were used for domestic purposes or to heat dwellings. Geothermal energy did not come to be used on a wider scale, particularly to produce electricity, until the beginning of this century, so that it is now used both directly as a source of heat and indirectly by converting it to electric power.

Direct use takes the form primarily of exploiting the low-energy hydrothermal resources, especially to heat dwellings (whether rural or urban). Many countries are using geothermal energy for this purpose, permitting major savings in fuel oil, gas or electricity for household needs. Heating greenhouses is another field wherein agriculture already has considerable experience. Note that geothermal waters are being used for more and more agricultural purposes, such as raising mushrooms and fish, drying organic materials, and fermentation. Some agricultural uses require higher temperatures. Drying fodders, fungi and bread grains requires a temperature of 100° C, or 140° C for accelerated drying of agricultural products. At temperatures of 70-180° C, geothermal energy can be used for refrigeration or to make ice, using an ammonia absorption cycle.

In the western area of Romania wells are discharging 43,000 cubic meters a day at temperatures of 36-126° C. In addition to heating some dwellings, supplying Nufarul district of Oradea with household warm water, and heating the Strand Restaurant and the TBC /Tuberculosis/ Clinic, those geothermal waters are used for agricultural production, to heat 2 hectares of greenhouses in Sacueni Commune, 1 hectare of carnation greenhouses in Oradea, 1 hectare of vegetable hothouses in Bors, and 500 square meters of greenhouses for flowers in Harghita. The hog-raising complex for 22,000 head in the Sacuieni CUASC /not further identified/ is heated with geothermal waters also used at the Palota Hemp Rettery.

The previous drillings indicate total potential discharges of 3,000 cubic meters per second at an average temperature of 75-85° C and with a heating capacity equal to that of 1.9 million tons of lignite per year. Besides enlargement of the greenhouse for flowers in Oradea, these new resources will permit construction of 75 hectares of greenhouses in the most favorable thermal areas (30 hectares of greenhouses and 30 hectares of solariums are being built in a first stage from 1981 to 1985).

One of the chief inconveniences of geothermal energy is that it can be used only in immediate proximity to the drillings, while the mineral residues in the water are not only very corrosive but may also clog the equipment. But these inconveniences peculiar to geothermal energy do not justify incomplete use of the energy capacity of the wells in the western part of the country. For example, in Bihor County alone the wells in operation in 1981 have an energy capacity of about 50 gram calories per hour, of which only 25 gram calories per hour were consumed, and that is equivalent to an annual loss of about 22,000 tons of conventional fuel. The way to exploit this potential completely is to make an integrated use of the geothermal water by stages and throghout the year, a technical undertaking that is in a first stage of completion.

Conversion of geothermal energy to electric power, the world output of which reached 2.5 gigawatts in 1980, is of no practical interest to Romania because of the required average temperature of the steam (170-300° C compared with 36-126° C in Romania).

Special Systems and Technologies for Use of Hydrothermal Energy

The special systems and technologies for use of hydrothermal electric power are based on the differences in the temperatures required for various agricultural activities, namely 20° for incubating spawn in fish breeding, 30° for biodegrading and fermenting, 40° for heating soil, 50° for raising mushrooms, 60° for livestock breeding and combined heating of greenhouses (atmosphere and warm beds), 70° for refrigeration (lower thermal threshold), 80° for heating buildings and greenhouses, 100° for drying organic materials (fungi, grass, vegetables etc.) and for washing and drying wool, 140° for accelerated drying of agricultural products, etc.

The traditional hydrothermal systems, that is those making direct use of the heat obtained, are not optimal for use of geothermal energy because a good deal of the weat is thrown out with the residual water. Moreover that heat can no longer be converted to mechanical or electric power. The only solution is to introduce a secondary cycle permitting transfer of most of the surplus energy in the geothermal fluid to another fluid whose physical properties permit recovery of the mechanical power.

The efforts to use the geothermal waters in successive stages until the last particle of heat in them is extracted led to discovery of procedures whereby the geothermal water is used as a source of heat in a first stage and as technological water in a following stage. This process is used in two flax and hemp retting enterprises in Timis and Arad counties that use thermal water as a technological water after mixing it with cold water. It would be a great foreward step to use geothermal water at a moderate temperature to produce electric power and then to heat buildings and as warm household water, so that the last levels of heat could be used to produce biomass.

The bad effects upon the environment of exploitation of geothermal waters are slight but cannot be overlooked. The chief potential for pollution is chemical and thermal pollution of both subterranean and surface waters, especially by the mineral salts in the geothermal waters. That pollution can be prevented by special emphasis on piping and cementing the wells. Moreover in the case of the geothermal waters at moderate temperatures air pollution by the gases in the hydrothermal fluids (ammonia, hydrogen sulfide and methane) is insignificant, and with the exception of the drilling operations, noise pollution is slight. And finally, exploitation of this kind of geothermal resource has never caused landslides anywhere.

Economic Effectiveness of Hydrothermal Energy

When geothermal energy is in competition with other energy sources, the decision to exploit and use it must be based on definite economic criteria. Previous experience shows that the cost of geothermal energy chiefly depends upon the investments made, while its profitability depends upon regular use of the discharges of geothermal waters at a rate close to the maximum capacity of the wells.

In Romania use of geothermal waters in agriculture has favorably affected both production costs and the technological process and product quality. The cost of growing hothouse roses with hydrothermal heating at Sacueni has been about half that in the hothouses heated with traditional fuel at Madaras and Salonta. Use of geothermal waters in the Palota Hemp Rettery shortened the retting time by 3 percent, raised the profitability of the tow by 3-5 percent and improved its quality as well. Heating the hog farms in the Sacueni CUASC with geothermal waters shortened the fattening period by 20 percent (a gain in weight of 225 tons of meat) at an additional annual profit of 175,000 lei. Use of geothermal waters in fish breeding doubled the growth rate of the weight of the carp, while the used waters (from the fourth stage of use) can be used to raise loach.

Increasingly efficient exploitation of hydrothermal energy resources depends on application of a series of economic and organizational measures at the international, regional and national levels, with priority on those in the National Plan. Training of specialists, international exchange of experience, expanded research and development, financing expensive drillings, and formation of the necessary infrastructure are only a few of the measures needed for efficient exploitation of the nation's hydrothermal energy resources, whose contribution to the energy reserve, especially that of agriculture, cannot be underestimated.

ECONOMY ROMANIA

PLANS TO DEVELOP SHIPBUILDING INDUSTRY

Bucharest REVISTA ECONOMICA in Romanian No 43, 25 Oct 85 pp 10-11

[Article by Stefan Petresc, plan-production director, and Eng Ion Drasoveanu, Galati Central for Shipbuilding: "Shipbuilding To Meet the Economy's Demands"]

[Text] The session of the Political Executive Committee of the RCP Central Committee of 5 October 1985 examined and approved the Special Program To Develop Shipbuilding in the 1986-1990 Period. In view of the major increase in the total volume of Romania's sea freightage, the program calls for an increase by about 2 times in the Romanian Sea Fleet's capacity in the next five-year plan. It is also intended to increase the capacity of the River Fleet, so that the volume of that kind of shipping will be 1.9 times greater. For efficient fulfillment of the tasks in this important sector of the national economy, the program calls for emphasis on assimilation and manufacture of highly complex ships for carrying special cargoes along with improvement of the performances and modernization of the classes of ships for carrying general and bulk cargoes. It is also planned to enhance efficiency in operation by making the ships' drives more productive and lowering the fuel consumption of the engines to present world standards.

Implementation of this program is an important step in development of water transport for the national economy and for the transportation sector. It is chiefly incumbent upon the machine building industry and the shipbuilding sector to carry out the assignments.

This form of transportation must be expanded for at least two reasons, first because Romania's geographic position on the Black Sea and with waters with high discharges permits development of a strong shipbuilding sector and maintenance of extensive sea and river traffic, and second because, from the standpoint of economic effectiveness, water transport permits shipping large quantities of products at lower costs than the other transport systems.

The shipbuilding sector also shares in the extensive developmental process that Romanian socialist industry has undergone. Benefiting by considerable investment funds, the shiyards have been intensively developed since 1970, when the first program to develop the Romanian shipbuilding industry was approved for 1971-1975, and it was followed by two other programs, for 1976-1980 and 1981-1985. Actually in the last 15 years the shipyards in Constanta, Galati, Braila, Drobeta-Turnu Severin, Oltenita and Giurgiu were rebuilt and modernized, and new ones were constructed in Tulcea and Mangalia.

The efforts made to develop and modernize the shipyards made it possible to increase and diversify shipbouilding considerably. In the current five-year plan shipbuilding is 4.2 times greater than in the 1971-1975 Plan, and the Romanian fleet is being equipped with 74 ships of various classes and a total tonnage of 2,349,000 tons dead weight (This tonnage includes ships already built as well as those scheduled to be finished by the end of this year). In this period Romania's shipping fleet has been equipped with a highly diversified variety of ships with a present total capacity of 4.9 million tons dead weight. Regular efforts have been and are now being made to build some new classes of ships, chief among which are the oil tankers of 5,000, 35,000 and 150,000 tons dead weight under construction at the Constanta, Galati and Braila shipyards.

Construction of modern seagoing and river ships that are efficient in operation depends upon an effort of technical thought and know-how supported by Romanian industry as a whole. The program to build oil tankers, for example, includes assimilation and delivery of highly complex machinery and equipment by the respective enterprises, such as main engines consuming limited fuel and 1,250 kilovolt ampere diesel generators supplied by the Resita ICM [Machine Building Enterprise], turbine pumps supplied by the Bucharest IMG [Heavy Machine Enterprise], hydraulic installations supplied by the Braila Progresul IUG [Heavy Equipment Enterprise], installation for telemetering and supercontrol of temperature of the gases in the main engine and an installation for remote control of temperatures in tankers supplied by Iasi Tehnoton, etc., which are important to the operation of the ship. Along with the progress made in equipping the fleet with seagoing freighters, the current five-year plan has also developed the river and industrial fleet, and 339 vessels have been delivered to meet the domestic requirements.

In addition to increasing the number of vessels and their tonnage, emphasis has been placed on further diversification of production. A wide variety of ships in great demand by the national economy have been placed in manufacture, such as oil tankers from 5,000 to 150,000 tons dead weight, a fueling tanker of 1,200 tons dead weight, freighters of 4,500, 5,000, 7,500 and 15,000 tons dead weight, ore boats of 55,000 and 65,000 tons dead weight, roll on-roll off freighters for carrying vehicles, push boats of 1,600, 2,400 and 2,800 horsepower, tugboats for servicing harbors, et al. Actually it may be said that the fleet's most varied requirements can be well met by Romania's shipbuilding sector at present.

The quantitative and qualitative development of shipbuilding and its wide diversification were due to specialization of the shipyards in classes of vessels and to that of the machinery enterprises under the central for making the mechanisms and assemblies that are installed on ships. This permits optimal performance of the manufacturing processes, greater labor productivity, better standardization of the ships' components, and reduction of the manufacturing cycle. In connection with the last point, reduction of the manufacturing cycle, we wish to note that in addition to the measures initiated and implemented by the central's units (such as promoting advanced technologies, securing regular supply of places of work, mechanization of various operations, enhancing labor productivity, etc.), a major contribution can and should be made by the suppliers of raw materials, materials, components and subassemblies by delivering them punctually and in conformity with the concluded contracts. We must remember, for example, that the late arrival of assemblies means taking down the hatchways and even cutting into the metal walls of the ships, which tends to increase the handling costs by 3 or 4 times in addition to holding up completion of the products.

Furthermore reduction of the manufacturing cycle is a major aim for all Romanian shipyards, chiefly because they make and deliver a product incorporating considerable material and manpower values. Once launched, a ship begins to produce like any investment capacity. Economically speaking, curtailment of the manufacturing cycle makes major savings in production costs by lowering the outlays on maintenance of the completed and activated installations and those on amortization of the fixed assets (fitting wharves,the slipway or drydock for construction etc.), etc.

For the 1986-1990 Five-Year Plan, the program drafted under Party General Secretary Nicolae Ceausescu's direct supervision to implement the total volume of sea and river freightage assigns important tasks to all the shipbuilding units for improvement of the activity as a whole, so that construction of seagoing and river ships will be developed quantitatively and qualitatively in close correlation with the national economy's growing needs. In the next five-year plan construction of seagoing freighters is to be increased by more than 2 times and that of oil tankers by more than 2-4 times.

The manufacturing programs of the central's units specify construction and delivery to the national economy of new classes of ships of increasing complexity for special cargoes along with improvement of the performances and modernization of the classes of ships for carrying general and bulk cargoes, such as those for carrying liquefied gases,, ammonia, liquid fertilizers,edible oil and bulk goods and of 8,500 and 25,000 tons dead weight, freighters of 8,000 tons dead weight carrying containers, multipurpose tankers of 5,000 tons dead weight, freighters for carrying packets of lumber, seagoing passenger ships with 200 and 450 berths, et al. In view of the need of increasing shipping on rivers and navigable canals the program also assigns major tasks for augmenting the river shipping fleet by increasing construction of automotive ships by more than 5 times and that of nonautomotive craft by 1.8 times, while construction of industrial ships is to meet the demands of the various beneficiaries. It is noteworthy that in drafting the Program for Further Development of Shipbuilding, in conformity with the programs approved at the session of the Political Executive Committee of the RCP Central Committee of 5 October 1985, special emphasis was placed on curtailing the list of manufactures while a number of standardized ships are to be developed, resulting in various structural variants to meet the requirements of the domestic and foreign beneficiaries. Meanwhile measures were devised to provide the shipbuilding sector with materials and components made in Romania. As a result the degree of integration according to classes of ships will reach 97-100 percent by 1990.

Since the provisions of the program to develop shipbuilding in the next five-year plan provide maximum loading of the production capacities of the respective units on both their level and that of the industrial central, technical, technological and organizational measures were devised to permit a major quantitative and qualitative leap. It is also intended to reduce the material and manpower inputs and the manufacturing cycle, to raise the technical and qualitative standards of the entire output as well as the degree of standardization, to improve the organization of production and labor and the supply of work places, etc.

To this end very heavy emphasis will be placed on further promotion of technical progress and on introduction and expansion of advanced technologies in the course of it, as basic requirements for enhancing labor productivity and reducing the inputs of raw materials, materials, energy and fuel as well as the manufacturing cycles. It is accordingly planned to expand mechanized cutting of sheet steel at all shipyards by use of automatic cutting machines and automatic and semiautomatic welding to the extent of 70-72 percent of the total welding operations performed on a ship (It is intended to begin automatic welding of steel sheets as well as automatic welding of profiles on both sides in a single operation); to introduce technology for control and alignment of sections, unit-sections and axis lines using theodolite and laser equipment; to improve the technology for thermal zinc plating by immersion of the elements to be combined and the pipes in vats of zinc alloyed with aluminum; to mechanize operations for sanding and painting ships in the stage of sections and unit-sections, and to introduce technology for cleaning the hulls of ships in repair by using robot handlers and technology for vertical automatic welding of the couplings between the planking sections, etc.

Through such measures and others as well that provide for better collaboration with the suppliers of raw materials, materials, components and subassemblies, more intensive training of working personnel, less turnover and more stability of personnel, better organization of production at every work place, more rapid assimilation of the new classes of ships, etc. (in which the shipyard the respective educational and research units, the central and the competent ministry are engaged), the necessary conditions will be provided for improvement of the work in this important activity and for making seagoing and river freighters available to the national economy in accordance with its requirements.

FEDERAL BUDGET FOR 1986 PUBLISHED

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 75, 31 Dec 85 pp 2205-2232

[Text] I. Summary Section

Article 1

The Federal Budget for 1986 contains the following:

1) the Federation's own revenues in the total amount of 663,730,000,000 dinars;

2) total expenditures, including the resources of the current budget reserve and the amount set aside for the permanent federal budget reserve-- in the amount of 1,103,390,400,000 dinars;

3) the difference between the total amount of expenditures and the total amount of the Federation's own revenues in the amount of 439,660,400,000 dinars;

4) the contributions of the republics and autonomous provinces--in the total amount of 439,660,400,000 dinars.

Article 2

The amount of 250,000,000 dinars is being set aside for the permanent federal budget reserve from the Federation's own revenues envisaged for financing the Federation's other functions and obligations and for the Federation's reserves for 1986.

Article 3

Revenues by types, forms and subforms and expenditures by basic purposes are set forth in the two partial sub-balances of the revenues and expenditures of the Federal Budget for 1985 in the amounts shown below:

SUB-BALANCE OF REVENUES AND EXPENDITURES TO FINANCE THE YUGOSLAV PEOPLE'S ARMY IN 1986

Classification Number			AMOUNT	
Revenue Form	Revenue Subform	I. REVENUES	Revenue Subform	Revenue Form
1	2	3	4	5
Type 03. Taxes on Product Sales and Service Charges				
03-1		Sales tax on products		388,200,000,000
	03-1-1	Part of the basic turnover tax	388,200,000,000	
		Total Type 03		388,200,000,000
Type 06. Customs Duties and Other Import Charges and Storage Charges				
06-1		Customs duties		156,142,800,000
06-2		Special import charges		95,257,200,000
	06-2-2	Special charge to equalize the tax burden on imported goods	80,134,900,000	
	06-2-3	Special charges for the keeping of customs records	15,115,700,000	
	06-2-4	Storage charges on goods stored in customs warehouses	6,600,000	
		Total Type 06		251,400,000,000
		Type 08. Revenues From Other Sociopolitical Communities		
08-1		Contributions of the republics and autonomous provinces		125,372,000,000
	08-1-1	Contribution of the Socialist Republic of Bosnia-Hercegovina	17,371,800,000	
	08-1-2	Contribution of the Socialist Republic of Macedonia	7,439,578,000	

08-1-3	Contribution of the Socialist Republic of Slovenia	19,736,614,000	
08-1-4	Contribution of the Socialist Republic of Serbia, exclusive of autonomous provinces	30,192,928,000	
08-1-5	Contribution of the Socialist Republic of Croatia	32,468,263,000	
08-1-6	Contribution of the Socialist Republic of Montenegro	2,646,034,000	
08-1-7	Contribution of the Socialist Autonomous Province of Vojvodina	14,917,505,000	
08-1-8	Contribution of the Socialist Autonomous Province of Kosovo	599,278,000	
	Total Type 08		125,372,000,000
	Total revenues for distribution (Types 03, 06, and 08)		764,972,000,000

Classification Number		II. DISTRIBUTION OF REVENUES	AMOUNT	
Distribution Group	Distribution Sub-Group		Distribution Subgroup	Distribution Group
1	2		4	5
		Basic Purpose 02. National Defense and Social Self-Protection		
02-1		Funds for the Yugoslav People´s Army		764,972,000,000
	02-1-1	Funds for the Yugoslav People´s Army in the current year	764,972,000,000	
		Total Basic Purpose 02		764,972,000,000
		Total distributed revenues of the Subbalance of Revenues and Expenditures to finance the Yugoslav People´s Army		764,972,000,000

SUB-BALANCE OF REVENUES AND EXPENDITURES TO FINANCE OTHER FUNCTIONS ANDOBLIGATIONS OF THE FEDERATION AND FOR THE RESERVES OF THE FEDERATION FOR 1986

Classification Number			AMOUNT	
Revenue Form	Revenue Subform	I. REVENUES	Revenue Subform	Revenue Form
1	2	3	4	5
		Type 05. Fees		
05-1		Administrative fees		4,919,900,000
	05-1-3	Consular fees	4,500,000,000	
	05-1-2	Customs fees	340,000,000	
	05-1-3	Other federal administrative fees	79,900,000	
05-3		Court fees		100,000
		Total Type 05		4,920,000,000
		Type 07. Revenues Under Specific Federal Enactments, Revenues of Administrative Agencies and Miscellaneous Revenues		
07-2		Revenues of federal administrative agencies		12,500,000,000
	07-2-1	Revenues of federal bodies, agencies and organizations	12,500,000,000	
07-4		Miscellaneous revenues		6,710,000,000
		Total Type 07		19,210,000,000
		Type 08. Revenues From Other Sociopolitical Communities		
08-1		Contributions of the republics and autonomous provinces		314,288,400,000
	08-1-1	Contribution of the Socialist Republic of Bosnia-Hercegovina	24,549,400,000	
	08-1-2	Contribution of the Socialist Republic of Macedonia	9,808,100,000	
	08-1-3	Contribution of the Socialist Republic of Slovenia	56,773,100,000	

	08-1-4	Contribution of the Socialist Republic of Serbia, not including autonomous provinces	86,851,000,000	
	08-1-5	Contribution of the Socialist Republic of Croatia	93,396,100,000	
	08-1-7	Contribution of the Socialist Autonomous Province of Vojvodina	42,910,700,000	
		Total Type 08		314,288,400,000
		Total revenues for distribution (Types 05, 07 and 08)		338,418,400,000

Classification Number		II. DISTRIBUTION OF REVENUES	AMOUNT	
Distribution Group	Distribution Sub-Group		Distribution Subgroup	Distribution Group
1	2		4	5
		Basic Purpose 01. Funds for Operation of Administrative Agencies		
01-1		Funds which workers realize as the income of the work community		23,505,395,000
	01-1-1	Funds for personal incomes	23,127,535,000	
	01-1-2	Funds for social services	377,860,000	
01-2		Funds for material costs		3,580,481,000
01-3		Funds for special purposes		44,543,124,000
	01-3-1	Funds for personal incomes and other personal benefits of officials and delegates	1,092,024,000	
	01-3-2	Other special purposes	23,412,250,000	
	01-3-3	Funds for general public purposes	20,038,850,000	
		Total Basic Purpose 01		71,629,000,000
		Basic Purpose 04. Funds Transferred to Other Sociopolitical Communities		

04-2		Supplemental funds		41,917,600,000
	04-2-1	Supplemental funds to the budgets of the republics and autonomous provinces	41,917,600,000	
		Total Basic Purpose 04		41,917,600,000
		Basic Purpose 05. Obligations to Finance Public Services		
05-9		For old-age and disability insurance		154,892,900,000
05-11		For welfare of disabled veterans		34,782,700,000
		Total Basic Purpose 05		189,675,600,000
		Basic Purpose 06. Other General Public Purposes		
06-2		Sociopolitical organizations		2,716,500,000
06-11		Compensation to the Social Accounting Service		394,800,000
06-12		Miscellaneous		23,000,000,000
		Total Basic Purpose 06		26,111,300,000
		Basic Purpose 07. Federal Reserve Funds		
07-1		Appropriation to the permanent budget reserve		250,000,000
07-2		Current budget reserve		859,900,000
		Total Basic Purpose 07		1,109,900,000
		Basic Purpose 08. Funds Placed in Time Deposits and Set Aside, Obligations and Other Purposes of Interest to the Federation		
08-4		Obligations under credits		7,975,000,000
	08-4-2	Long-term obligations from past years	7,975,000,000	
		Total Basic Purpose 08		7,975,000,000
	Total revenues distributed of the Sub-Balance of the Sub-balance of Revenues to Finance Other Functions and Obligations of the Federation and for the Reserves of the Federation in 1986			338,418,400,000

II. Detailed Section

Article 4

Expenditures in the amount of 764,972,000,000 dinars, as indicated in the Sub-Balance of Revenues and Expenditures to Finance the Yugoslav People´s Army, shall be distributed as follows:

Item No	Distribution Group and Subgroup	Basic and Detailed Purpose	AMOUNT	
			Item	Basic Purpose
1	2	3	4	5
		Section 1. Federal Secretariat for National Defense		
		Basic Purpose 02--National Defense and Social Self-Protection		
210	02-1-1	Funds for the Yugoslav People´s Army in the current year	764,972,000,000	
		Total Basic Purpose 02		764,972,000,000
		Total Section 1		764,972,000,000

Article 5

Expenditures in the amount of 338,418,400,000 dinars, as indicated by basic purposes in the Sub-Balance of Revenues and Expenditures to Finance Other Functions and Obligations of the Federation and for Reserves of the Federation in 1986, shall be distributed among entities disbursing and using the appropriations and by detailed purposes in the following amounts:

Item no	Distribution Group and Subgroup	Basic and Detailed Purpose	AMOUNT	
			Item	Basic Purpose
1	2	3	4	5
		Section 1. State Presidency of the Socialist Federal Republic of Yugoslavia		

Title 1. State Presidency

Basic Purpose 01--Funds for Operation of Administrative Agencies

1	01-1-1	Funds for personal incomes of personnel	182,141,000	
2	01-2	Funds for material costs	2,590,000	
3	01-3-1	Funds for personal incomes and other personal benefits of officials	34,666,000	
4	01-3-2	Compensation for separation from family	2,430,000	
5	01-3-2	Traveling expenses	2,730,000	
6	01-3-2	Postage-telegraph and telephone service	2,884,000	
7	01-3-2	Office supplies	5,500,000	
8	01-3-2	Entertainment	1,176,000	
9	01-3-2	Trips and visits	91,636,000	
10	01-3-2	Remuneration of nonstaff personnel	86,000	
11	01-3-2	Subscription to official gazettes, magazines, journals and newspapers	1,092,000	
12	01-3-2	Costs of manufacturing medals and decorations	36,000,000	
13	01-3-2	Costs of services	70,000	
14	01-3-2	Compensation for irregular working hours	1,170,000	
15	01-3-2	Purchase of uniforms and work clothes	666,000	
16	01-3-2	Addition to equipment, furnishings and fixtures	6,500,000	
17	01-3-2	Equipping and redecorating official housing	420,000	
18	01-3-2	Expenses of the Federal Council for Protection of Constitutional Order	168,000	
19	01-3-2	Expenses of the National Defense Council	150,000	
		Total Basic Purpose 01		372,075,000
		Total Title 1		372,075,000

Title 2. Department for Entertainment Facilities of the SFRY State Presidency

Basic Purpose 01--Funds for Operation of Administrative Agencies

20	01-1-1	Funds for personal incomes of personnel	87,325,000	
21	01-2	Funds for material costs	60,732,000	
22	01-3-2	Traveling expenses in Yugoslavia and abroad	134,000	
23	01-3-2	Addition to furnishings and fixtures	1,008,000	
24	01-3-2	Costs of maintaining structures, furnishings and fixtures	70,850,000	
25	01-3-2	Personal incomes of seasonal workers	840,000	
26	01-3-2	Remuneration of nonstaff personnel	900,000	
27	01-3-3	Costs of maintaining and using the villas on Brioni used for entertainment	170,000,000	
		Total Basic Purpose 01		391,789,000
		Total Title 2		391,789,000
		Total Section 1 (Items 1 through 27)		763,864,000

Section 2. SFRY Assembly

Basic Purpose 01--Funds for Operation of Administrative Agencies

28	01-1-1	Funds for personal incomes of personnel	779,758,000
29	01-2	Funds for material costs	17,080,000
30	01-3-1	Funds for personal incomes and other personal benefits of officials	614,907,000
31	01-3-2	Funds for housing construction representing 4 percent of personal incomes and other personal benefits of officials	24,597,000
32	01-3-2	Postal-telegraph and telephone services	44,492,000
33	01-3-2	Compensation for overtime	16,500,000
34	01-3-2	Remuneration of nonstaff personnel	1,999,000
35	01-3-2	Operating expenses of delegates and assembly bodies	140,000,000
36	01-3-2	Purchase of domestic and foreign books	460,000

37	01-3-2	Subscription to official gazettes, bulletins and journals and magazines	5,600,000	
38	01-3-2	Publication of transcripts	6,916,000	
39	01-3-2	Preparation of publications of the SFRY Assembly, information summaries, bulletins and other assembly materials	10,920,000	
40	01-3-2	Expenses of parliamentary delegations	39,643,000	
41	01-3-2	Costs of entertainment	1,937,000	
42	01-3-2	Purchase of clothing and footwear	4,587,000	
43	01-3-2	Services rendered by others	6,300,000	
44	01-3-2	Costs of maintaining the moto pool	48,546,000	
45	01-3-2	Printshop expenses	45,881,000	
46	01-3-2	Purchase of equipment and adaptation	17,860,000	
47	01-3-2	Share in preservation of the main museum layout of the Museum of the First and Second Session of AVNOJ [Antifascist Council for the National Liberation of Yugoslavia]	5,000,000	
48	01-3-2	Office supplies, minor items, paper and other expendables	138,880,000	
49	01-3-2	Operating expenses of special commissions	1,392,000	
50	01-3-2	Tito's Scholarship Fund for Young Workers and Workers' Children of Yugoslavia	1,050,000	
51	01-3-2	Redecorating and furnishing housing for official use	3,250,000	
52	01-3-2	Costs of holding elections and recall	140,000,000	
		Total Basic Purpose 01		2,117,825,000
		Total Section 2 (Items 28 through 52)		2,117,825,000

Section 3. Council of the Federation

Basic Purpose 01--Funds for Operation of Administrative Agencies

53	01-1-1	Funds for personal incomes of personnel	80,805,000
54	01-2	Funds for material costs	2,535,000

55	01-3-1	Funds for personal incomes and other personal benefits of officials	59,123,000	
56	01-3-2	Postage-telegraph and telephone service	2,405,000	
57	01-3-2	Traveling expenses in Yugoslavia	500,000	
58	01-3-2	Traveling expenses abroad	50,000

CHANGES IN FEDERAL BUDGET FOR 1985

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian No 75, 31 Dec 85 pp 2232-2233

[Amendments enacted by the SFRY Assembly in a session of the Federal Chamber in Belgrade on 28 December 1985, signed by Radovan Vlajkovic, chairman of the SFRY State Presidency, and Ilijaz Kurteshi, president of the SFRY Assembly]

[Text]

Article 1

In the Federal Budget for 1985 (SLUZBENI LIST SFRJ, Nos 71, 1984 and 53, 1985) the amount "690,254,500,000" in Article 1, Subparagraph 2, shall be replaced by the amount "697,482,300,000"; in Subparagraph 3 the amount "253,633,600,000" shall be replaced by the amount "260,861,400,000"; and in Subparagraph 4 the amount "243,633,600,000" shall be replaced by the amount "250,861,400,000".

Article 2

In Article 3 the following change shall be made in Section I. Revenues of the Balance of Revenues and Expenditures of the Federal Budget for 1985:

1) In Type 08. Revenues from Other Sociopolitical Communities the amount "243,633,600,000" in Revenue Form 08-1 Contribution of the Republics and Autonomous Provinces shall be replaced by the amount "250,861,400,000"; in Revenue Subform 08-1-1 Contribution of the Socialist Republic of Bosnia-Hercegovina the amount "33,708,292,000" shall be replaced by the amount "34,709,791,000"; in Revenue Subform 08-1-2 Contribution of the Socialist Republic of Macedonia the amount "14,353,577,000" shall be replaced by the amount "14,782,475,000"; in Revenue Subform 08-1-3 Contribution of the Socialist Republic of Slovenia the amount "36,947,095,000" shall be replaced by the amount "38,084,927,000"; in Revenue Subform 08-1-4 Contribution of the Socialist Republic of Serbia excluding autonomous provinces the amount "60,317,418,000" shall be replaced by the amount "60,058,065,000"; in Revenue Subform 08-1-5 Contribution of the Socialist Republic of Croatia the amount "63,029,154,000" shall be replaced by the amount "64,900,976,000"; in Revenue Subform 08-1-6 Contribution of the Socialist Republic of Montenegro the amount "5,144,594,000" shall be replaced by the amount "5,297,141,000"; in Revenue Subform 08-1-7 Contribution of the Socialist Autonomous Province of Vojvodina

the amount "28,938,302,000" shall be replaced by the amount "29,798,308,000"; in Revenue 08-1-8 Contribution of the Socialist Autonomous Province of Kosovo the amount "1,195,168,000" shall be replaced by the amount "1,229,717,000"; and in the line item Total Type 08. the amount "243,633,600,000" shall be replaced by the amount "250,861,400,000";

2) In the line item Total Revenues for Distribution (Types 01 through 09) the amount "690,254,500,000" shall be replaced by the amount "697,482,300,000".

In Section II Distribution of Revenues the following changes shall be made:

1) In Basic Purpose 04. Funds Transferred to Other Sociopolitical Communities the amount "52,734,200,000" in Distribution Group 04-2 Supplemental Funds shall be replaced by the amount "59,962,000,000"; in Distribution Subgroup 04-2-1 Supplemental Funds to Budgets of Republics and Autonomous Provinces the amount "52,734,200,000" shall be replaced by the amount "59,962,000,000"; and in the line item Total Basic Purpose 04. the amount "52,734,200,000" shall be replaced by the amount "59,962,000,000";

2) In the line item Total Revenues Distributed and Undistributed the amount "690,254,500,000" shall be replaced by the amount "697,482,300,000".

Article 3

In Article 4 the amount "690,254,500,000" shall be replaced by the amount "697,482,300,000";

1) In Section 14. Federal Secretariat for Finance, Title 1. The Secretariat, Basic Purpose 04. Funds Transferred to Other Sociopolitical Communities, the amount "14,311,000,000" in Item 247 Supplemental Funds to the Socialist Republic of Bosnia-Hercegovina shall be replaced by the amount "15,802,400,000"; in Item 248 Supplemental Funds to the Socialist Republic of Macedonia the amount "6,522,900,000" shall be replaced by the amount "7,202,560,000"; in Item 249 Supplemental Funds to the Socialist Republic of Montenegro the amount "5,382,100,000" shall be replaced by the amount "5,943,040,000"; in Item 250 Supplemental Funds to the Socialist Autonomous Province of Kosovo the amount "25,468,200,000" shall be replaced by the amount "29,964,000,000"; in the line item Total Basic Purpose 04. the amount "52,734,200,000" shall be replaced by the amount "59,962,000,000"; in the line item Total Title 1. the amount "108,914,888,000" shall be replaced by the amount "116,142,688,000"; and in the line item Total Section 14 (Items 231 through 281) the amount "109,092,151,000" shall be replaced by the amount "116,319,951,00".

Article 4

These amendments shall take effect on the day after publication in SLUZBENI LIST SFRJ.

SQUAD COMPOSITION, WEAPONRY DETAILED

East Berlin BAUERN-ECHO in German 16 Oct 85 p 6

[Article by Lt. Col. Werner Kilian: "Combat Vehicles of Our Motorized Rifle Units"]

[Text] All of our motorized rifle units now have modern combat vehicles and heavy weaponry. It is completely different from a similar NVA unit in 1956, the year the NVA was founded.

In 1956, the nine enlisted men and the one non-commissioned officer who was the leader of an infantry squad had two PPSh 41 automatic rifles built by the Shpagin arms plant in the Soviet Union (but referred to as MPi-41 in the NVA) and six 1944-model carbines as well as one RPG-2 bazooka. Aside from the bazooka which was developed and built after 1945 and had a range of 150 meters, all the other Soviet weapons had seen service in the Great Patriotic War. They were all robust, easy-to-use weapons of simple construction with which the soldiers were quickly able to familiarize themselves. The "Shpagin" had a drum magazine which held 71 7.62 pistol bullets which could be fired singly or in continuous bursts. To attack targets at distances greater than 200 meters, the squad used the carbines and a DP machine gun. Both of these weapons used 7.62 rifle bullets. The carbine was a multiple-load weapon with a five-cartridge magazine. After every shot, it had to be reloaded by hand. The flat drum magazine of the machine gun, on the other hand, provided room for 47 cartridges.

Although each infantry squad was supposed to have one APC to serve as a combat and transport vehicle, only a very few two-axle SPW-40s and three-axle SPW-152s were actually available in the beginning. Both of these were open, non-amphibious, lightly armored vehicles equipped with one heavy machine gun.

And what is it like today--almost 30 years later ? Every NVA motorized rifle squad now has a completely closed, amphibious combat vehicle. It may either be a SPW-60PB or an SPW-70 or a BMP-1 or BMP-2 armored personnel carrier. While both of the combat vehicles are equipped with a 14.5mm turret machine gun and a 2000-cartridge 7.62mm machine gun and otherwise merely differ in terms of overall height, motor type and hull construction, the APCs differ above all in their turret weaponry. The BMP-1 has a 73mm cannon while the BMP-2 is equipped with a 30mm cannon and a different type of guided antitank missile.

In a motorized rifle squad equipped with a BMP-1 and the usual weaponry, the squad leader, his deputy as well as the No 2 bazooka gunner, one other squad member, the turret gunner and the driver all carry a Kalashnikov automatic rifle as their personal firearm. That automatic rifle as well as the two Kalashnikov light machine guns (IMG K) used by the squad will also fire the M 1943 7.62mm cartridge. The rifle magazines hold 30 rounds each but the machine guns hold 40 and 75 rounds respectively. A number of the rifle and machine gun parts are interchangeable. The RPG-7 gunner (the RPG-7 has three times the range of the old RPG-2) and the two machine gunners carry a Makarov Model PM 9mm self-loading pistol as an additional firearm. The squad's weaponry is augmented by the turret armor which includes a 73mm smooth bore cannon with 40 shells and a 7.62mm heavy machine gun with 2,000 cartridges as well as a launching device for the antitank missile (four of which are carried on board the APC) situated above the cannon barrel.

SED SECURITY HEAD REAFFIRMS VALUE OF WORKER MILITIAS

East Berlin DER KAEMPFER in German Vol 30 No 1, Jan 86 pp 1-2

[Excerpt from speech by Wolfgang Herger, CC member, head of the SED CC section for security issues, to party activists of Magdeburg Bezirk]

[Text] A few months before the Eleventh SED Congress, the Eleventh CC Plenum drew up a persuasive balance sheet: At the side of the Soviet Union and firmly rooted in the community of socialist nations, the German Democratic Republic is successfully coping with the challenges of our age. Our socialist fatherland is proving to be a reliable factor in the fight for peace, progress and freedom, a stable pillar of socialism in the heart of Europe. The policy of our party, directed to the welfare of the people and resolutely guided by the Central Committee and Comrade Erich Honecker, its general secretary, is backed and carried out by the working people in town and country. That is demonstrated by the popular movement in preparation of the Eleventh Congress and its many initiatives.

The Stronger Socialism, the More Secure Is Peace

In view of the threat to mankind, evoked by the most aggressive circles of imperialism, it is more obvious than ever that socialism is alone able to guarantee the first human right, the right to live in peace. In alliance with all men of good will, a strong socialism is alone capable of keeping at bay the forces threatening peace. The working people realize the Tenth SED Congress resolutions by tremendous achievements in the national economy and all sectors of our life. They are thus creating favorable conditions for the successful further pursuit of our domestic and external policy. More and more citizens of our country are guided by the appreciation that the stronger socialism is, the more secure is peace.

The fighters of your district also have provided the correct answer to the challenge of our age as characterized at the Tenth and Eleventh CC Plenums: In addition to their concrete targets for the fulfillment of the 1985 and 1986 economic plans, they have adopted as their own the competition appeal of the comrades of the Magdeburg Ernst Thaelmann Battalion.

Fighting Actions Weigh Heavily

By their thousands of individual and hundreds of collective obligations, they make sure of a solid rise in performance in this year of the Eleventh SED Congress. These are directed above all to the conclusion by exemplary results of training tasks, exercises and reviews of standards, fight for new best titles and marksmanship certificates or carry on military propaganda at polytechnical secondary schools as well as skilled tradition and partnership work.

All this activism is realized in many useful actions and best performances for the benefit of our workers and farmers' power. A look at the various obligations demonstrates that the unity of economics and defense readiness is consciously appreciated. Let us cite the example of Comrade Karl-Heinz Mathes from the pioneer squad of the Hermann Matern Batallion, brigade leader at the radiator molding shop of the Thale Harzer Works VEB and activist of socialist labor. He assumed the following obligations for the Eleventh SED Congress: Above plan output, enabling a youth collective to successfully conduct the socialist competition, excellent marks for rifle shooting and norm acceptance, thorough preparation for all topics of training, exemplary care for personal weapons as well as for individual and collective equipment.

Balance Sheet of a Successful Training Period

In the training period just concluded, fighters, noncommissioned officers and commanders have accomplished all their tasks with exemplary personal commitment. They mastered new test situations and honorably carried out the class assignment decided upon by the Tenth SED Congress.

Among the units recording an outstanding development is the Willi Oerke combat company from the Magdeburg housing construction combine. The comrades of this unit have achieved good and excellent results in the entire training period, both with respect to political and combat training. Though many comrades work at various construction sites in the district, the collective managed a satisfactory attendance at training. The comrades of that unit also accomplished in an exemplary manner the tasks involved in ensuring combat readiness. Also among the units largely deciding the pace of the evolution of fighting power and combat readiness is the Willi Kutz combat company. In the period of training under review, this collective obtained the merit title, 67 of its fighters hold the merit badge, and another 78 met the conditions for the marksmanship badge. The comrades of the company did 4,900 hours of work to reconstruct their assembly area and a training base in Haldensleben Kreis. This work has a value of M65,000. The unit cultivates cordial partnership relations with a company of the Border Troops and a unit of the Soviet Army. The fighters in the two enterprises, the Ceramic Works VEB and the Haldensleben Transmission Works VEB are achieving outstanding performances. The list of such exemplary units is long. It demonstrates the positive outcome of a successful training period.

Appreciation for Exemplary Performances

As you know, the Politburo report to the Eleventh CC Plenum expressed its appreciation for these achievements by the following words: "At the past weekends, the combat groups of the working class successfully concluded the 1985 training year by the reviews conducted in all units. The Politburo thanks all fighters, noncommissioned officers and commanders for their demonstrated and full willingness to serve." Our heartfelt thanks are due the comrades of the German People's Police, the comrades in the senior party organs, the secretaries and managements of the basic organizations in the enterprises, the state managers and all other comrades responsible for the development of the combat groups as well as spouses and family members for their often demonstrated understanding and their moral support for service in the combat groups.

Reason for Optimism

We are all moved by the question of what 1986 will mean with respect to the settlement of the main problem of our time--the prevention of a nuclear world war? What can we do to preserve peace for us, our children and children's children? The Eleventh CC Plenum has plainly indicated the difficulties of the situation. And yet there is every reason to view the future with optimism. Thanks to the existence of the Soviet Union and the other socialist states, thanks to the military-strategic equilibrium achieved by heavy sacrifices--especially in the Soviet Union--, imperialism is no longer able to arbitrarily decide the fate of the peoples. To the extent that the international balance of power is shifting toward socialism and all peaceful forces, it will be possible to compel the old and war generating society to keep the peace and to banish the threat of war. No imperialist world domination is achievable any longer.

There is no reasonable alternative to the policy of peaceful coexistence between countries with different social system, as proposed by socialism. The Soviet Union, the chief power of socialism, together with the other states of the socialist coimmunity, offers mankind another approach than that of the arms race and the accumulation of death dealing weapons. At the Geneva summit it once again submitted an entire complex of concrete measures, directed to the limitation and reduction of nuclear arms and other weapons of mass destruction, the prevention of the militarization of space, the consolidation of confidence and security. As for the GDR, constructive steps toward securing peace, detente and disarmament take precedence in our foreign policy. We back the suggestions made at Sofia. We champion the recovery of a healthy climate in European and international affairs, a return to detente.

Reliable Defense of the Socialist Fatherland

Just because we are for peace, we consistently realize Lenin's teaching regarding the defense of the socialist fatherland. We have always done and will continue to do everything possible for the reliable defense of the workers and farmers' power. The GDR will continue at all times to faithfully carry out its obligations in the alliance of the Warsaw Pact. By bringing to bear the strength of all our people, we succeeded in strengthening our republic's defensive ability to the extent needed. The same will be the case in future years.

In the 32 years of its existence, the combat groups of the working class have demonstrated that this revolutionary tool of power, directly led by the party, represents an essential factor in the security of the workers and farmers' power in the GDR. We can no longer even imagine our social life without the combat groups.

Geared to Great Challenges and Criteria

The proportion of party members and the personal stability of the collectives remain important conditions for the combat strength of the units. At the same time we need to take care that steady changes occur in the units; new fighters need to replace older comrades. This makes great demands on the quality of leadership, in particular empathy, tact, knowledge of human nature and pedagogical skills.

All commanders are called upon for pleasure in decisionmaking, prudence in leadership and the realistic assessment of their own strength so as to further raise the quality of political and combat training. Not least do the commanders need the ability to organize training and realistically appraise performances. The latest training period provides us with knowledge which will have to be taken into account later. We are thinking, for instance, of greater scope for the commander himself with regard to the organization of training. He is best equipped to know which of the topics and which problems are likely to take a great deal of time in his unit. Great physical and psychological challenges confront all fighters. For them, any test situation needs the renewed acceptance of standards, in particular the standard of weapons training and physical fitness. Linked with all this are great challenges to the comrades' willpower. The success of the collective essentially depends on individual performances and attitudes.

The more relevant incorporation of the review of norms in the entire course of the training year seems appropriate. It will also be important to assign even greater value to the practical relevance of training, the exact mastery of commands and basic skills, the actual guarantee of the leadership of a unit on the move. Our fighters' outstanding willingness to serve is demonstrated whenever reviews and other training tasks relating to the units are carried on at weekends. The fullest possible attendance at training or upon alarm does not happen fortuitously. It must be organized by long-range planning--in close cooperation among party organizations, state managers and commanders.

The Leading Role of the Party--The Most Important Condition for Successful Work

The most important condition for successful work in the combat groups will always be the strengthening of the party's leading role. The attendance at exercises and reviews of senior party officials in the enterprises and Kreis managements as well as of members of the secretariat of the respective Bezirk managements should therefore steadily continue to maintain their direct influence on the combat groups. These officials' participation has always been coupled with personal conversations in the unit, with active ideological work within the framework of political training or at meetings and agitation appeals. This motivates many fighters to complete the planned training with the greatest possible willingness to perform.

Consistent Implementation of Party Decisions

Another constant priority task is the explanation and resolute implementation in all units of decisions by the Central Committee and the Bezirk managements. The same holds true for the exact implementation of commands and instructions.

In this meaning we are committed to everywhere perfecting the conditions ior service and the training of the combat groups. The new order of service must become familiar to all combats. Truly communist relations tend to evolve in the combat groups, precisely because people of similar mindsets cooperate here, who know one another from working together and "lying side by side in a prone shelter." Of course this also implies the need to make definite demands and call for their realization.

The honorary study groups carry a major responsibility. As the working organs of Bezirk and Kreis managements they help prepare appropriate decisions, always realistically appraise the situation and affect cadre development. We expect the comrades operating in the honorary study groups in future also to carry on intensive instructive and supervisory eefforts for the implementation of party decisions in the combat collectives.

Working With the Commanders

A constant key question is the training, support for and instruction of our commanders. Many have been active for years. The party expects a commander of a combat group to be able in particular to

-- always make his fighters aware of the meaning of their employment and class assignments, organize his unit as a sound, politically reliable and militarily able combat collective which will act resolutely in any situation and accomplishing every party assignment;

-- himself set an example, earn the trust of his comrades, make sure that their willingness to serve is sensibly used and help the noncommissioned officers lead their men;

-- strengthen the combat strength, respect for and authority of the party in the unit and promote trustful relations between communists and unaffiliated members of the group.

Socialist Competition in the Sign of the Preparations for the Party Congress

In accordance with the appeal of your Ernst Thaelmann combat group battalion, the socialist competition among the combat groups at the beginning of the training period stands entirely in the sign of the preparations for the Eleventh SED Congress. The echo from all units of your Bezirk and the entire country is strong and concrete. In Thaelmann's spirit, we are concerned here to achieve preeminent performances to strengthen socialism. These are the proper answers to the challenges of our age. They show that our fighters understand the connection between strong socialism and secure peace.

Let us therefore with all energy tackle the new training year which is entirely in the sign of the Eleventh SED Congress.

INTRODUCTION OF NEW WEAPONS SYSTEM DISCUSSED

East Berlin MILITAERTECHNIK in German No 1, 1986 [signed to press 7 Nov 85] pp 1-3

[Article by Lt. Gen. W. Rothe: "Current Problems and Programs in Design of Man-Technology Relationships in NVA Ground Forces"]

[Text] The focus of the first few months of this year is almost entirely on the preparation of the 11th party congress of the SED and the 30th anniversary of our socialist armed forces. These days, the main topic of the many discussions taking place in the military collectives is to take stock of what has been achieved and to look ahead to the future--particularly as regards the proper use of combat equipment, weaponry and other gear.

For almost 5 years now, the members of our armed forces and the civilian employees have been making a concerted effort to fulfill the task set by the 10th party congress of the SED which was "to make masterful use of military equipment and to take the qualitatively rising demands of the man-military equipment relationship into conscious consideration."[1]

The results achieved during this time span are substantial and the new insights gained are of great value for the continuation of programs aimed at perfecting the relationship between man and technology. They are part of the 30 years of experience which our NVA has obtained side by side with the Soviet army and the other fraternal armies in solidifying combat effectiveness and combat readiness. They also give proof that the time-tested policies of our party were right to provide modern military equipment on time and in adequate quantity to our armed forces and, at the same time, thoroughly to prepare the members of our armed forces both politically and militarily for the proper use of combat, command and maintenance technology.

The units and service branches have paid particular heed to the statement by the Politburo of the SED central committee contained in its "Comments on the Report of the Main Political Administration Regarding Political-Ideological Work in the NVA." The statement called on all commanders, party organs and organizations to lay even greater stress on the fact that modern weaponry and combat equipment requires above all a commensurate effort in terms of leadership, complex political-ideological programs, equipment maintenance as well as working and living conditions.

More than ever, it is our job to apply in a purposeful manner all our valuable expertise and insight into the man-military technology relationship in our political-ideological programs, in combat training and in the operation and maintenance of the equipment.

Thanks to the goal-oriented political-ideological programs of our party and mass organizations, the social science and political training programs and the operation-oriented political mass programs on the relationship between man and military equipment are being conducted with ever growing awareness. We may therefore safely say today that the understanding of the reciprocal relationship between man and military equipment--particularly as regards the control function exercised by man--has constantly been growing over the past several years among the members of our armed forces.

By further strengthening the Marxist-Leninist frame of reference as it applies to this reciprocal relationship, we will be creating the necessary conditions in the future for making proper use of military equipment, taking full advantage of its combat capabilities and assuring its proper maintenance.

This relationship, however, is by no means constant or rigid. On the one hand, the fundamental significance of the man-military equipment nexus in the socialist armed forces continues to grow in importance in view of the threat of war emanating from imperialism and the immense consequences of a potential war. To develop this relationship in a purposeful manner is of increasingly decisive importance for combat effectiveness and combat readiness. On the other hand--as man and his equipment continue to develop--the relationship itself continues to evolve as the dominant role of man as creator, producer and user of technology continues to grow.

Our ground forces are taking this fact into consideration. The trends in the development of the service branches, special units and services are reviewed on a regular basis and general as well as specific guidelines are elaborated. Independent of all special considerations, there is one basic guideline to be followed, i.e. that the development of the man-military equipment relationship is not in the first instance an organizational-technical or technological problem but above all a long-term, complex process of political work, education and training of the members of the armed forces.

What has already been achieved offers convincing proof that the biggest gains in the best use of military equipment, weaponry and gear are being achieved in those military collectives in which the commanders, the technical specialists and, of course, the political and party workers place the proper evaluation and assign the proper political priority to technical issues.

1. Intensifying Class Attitudes toward Military Equipment

One of our priority tasks is to make a concerted effort to intensify class attitudes toward military equipment. It must be understood that weapons in the hands of the soldiers of the working class are a decisive tool in the protection of socialism and the preservation of peace. This calls for solid faith in the reliability of our military equipment , for a sense of responsibility and creative commitment to the business of soldiering as well as a love for technology which finds expression in constant and conscientious care to maintain it in a state of combat readiness. Attitudes such as these have led to superior achievements in the proper use of equipment in units and service branches in preparation for the 11th party congress of the SED.

In further developing class attitudes toward military equipment, it will be our job to take certain trends into consideration which place high demands on our commanders, political organs and party organizations. They are a consequence above all of the more and more rapid changes in the quality of military equipment and also of the political and social development of the members of the armed forces themselves.

2. Higher Quality Learning

As a consequence of NATO confrontation policy and the effect of scientific-technological progress weapon systems are becoming more and more complicated and the time intervals between the introduction of new technologies and/or their modernization are becoming shorter. Refitting and/or modernization call on training personnel and trainees to acquire more and more comprehensive and fundamental information with regard to the installation, impact and tactical use of equipment and also with regard to potential actions to be mounted by the adversary.

The systems character of the equipment calls for more and more thorough technical familiarity with electronic, electrical, hydraulic, mechanical, pneumatic and other components. This applies both to technical equipment such as the T-72 tank, the antiaircraft missiles systems of the ground forces and the self-propelled artillery as well as command and maintenance technology.

Both operating and maintenance personnel need to become more and more familiar with the many processes involved in the activation, operation, coordination and check out of weapons and equipment.

For this reason, aggressive approaches to learning and training have become a major factor in assuring combat efefctiveness and combat readiness. Thus, the activation of a broad-based learning movement is not just a temporary phenomenon but an indispensable, long-term ingredient of political leadership dedicated to mastering the technology. This mass initiative calls for familiarization with military equipment on the part of leading cadres and the perfection of methodological skills on the part of young training personnel. This includes mass practice and training exercises by members of the FDJ and young members of the armed forces which aim at increasing their knowledge and improving their skills. It also includes participation in socialist competition for qualification in technical fields. In accordance with the program outlined at the 12th conference of the delegates of FDJ organizations in the NVA, it will be our job to continue time-tested procedures at a higher level. What we mean by this is to place even greater emphasis on the youth initiatives in the technical field in connection with effective patronage activities.

More and more use is being made of a method employed by a number of units where theroretical and technical know-how is transmitted in interesting ways to groups by experts and particularly well-versed older draftees and/or reservists.

3. Using Modern Military Equipment to Raise Combat Readiness

Units which received modern weapons over the past several years have made good progress.

Efforts at the command and the political-ideological education level were focused on rapid introduction of the equipment and equally rapid retraining of personnel in accordance with the experiences of the Soviet army. This resulted in a relatively short period of time in a high level of expertise with regard to the military equipment and weaponry. These efforts demonstrated that goal-oriented, pinpointed political education, combat and technical training as well as care and maintenance can lead to short-term success in mastering the technology.

But experience has also taught us that there will be lasting progress only if the social problems connected with the higher demands can gradually be resolved at the same time. There is a need to take the changes in working and living conditions of our fighting men, occasioned by the nature of the technology, its operational principles and the accompanying training programs, into consideration and to include them in our planning.

It will be our priority concern to do away with time delays as best we can. This will require a genuinely scientific style of leadership, improved intellectual preparation and above all a high degree of intensification in combat training and the rationalization of care and maintenance.

Progress in this respect has been made in such units and maintenance facilities where commanders and technical specialists , led by the members and candidates of the SED, made their influence felt. This means that the proper maintenance technology is used; that all the modern maintenance tools are thoroughly and accurately applied and that maintenance work is performed on schedule. Things work really well in all those instances where innovation and inventiveness are given free rein; where people independently look for more efficient ways of doing a job even while adhering to regulations, e.g. cleaning equipment in a shorter period of time.

As we introduced new equipment in our ground forces, we found on a number of occasions that while it is important to take those trends in the man-technology relationship into consideration which arise whenever new military equipment is introduced, it is equally important to focus attention on those units where the modernization process has not or has not yet taken place.

There is the chance of encountering delays, of underestimating the combat potential and effectiveness of available equipment and commitment to combat training and maintenance may lag. For this reason, it is necessary to conduct a thorough analysis and arrive at a coordinated position among the party organizations in order to determine early on why different units and commands are using different generations of equipment and how these work together in practice.

We can proudly point to a whole array of equipment and weaponry which has stood the test of time and which will be just as valuable to us in the future, if we know how to use it and to take advantage of its combat potential. The point therefore is to see how our combat responsibilities can successfully be discharged by using all the equipment available to our units and commands.

4. Using Modern Training Methods to Intensify Combat Training

Since the start of the eighties, we have been introducing more and more modern training equipment and simulators in our ground forces. Many units, commands and training centers are receiving new, highly efficient combat training technology. This equipment is capable of simulating the functions and operations of combat, command and maintenance technology to a large extent; it helps reduce wear and tear of the actual equipment and is extremely cost-effective in addition.

There is a kind of special training process which mediates between the fighting man and his military equipment. Commanders, political bodies and party organizations everywhere are looking into the question of how this affects the man-military equipment relationship. This, in turn, provides the political leadership with important information.

The positive approach of the training personnel and the trainees to the training equipment and the simulators; the recognition of their cost-effectiveness and the favorable conditions for competitiveness in combat training all have a positive effect on the training results achieved.

Efficient use of training equipment and simulators leads to marked progress in the intensification of combat training. The "Paul Hegenbart" command, for example, made use of an APC training package and managed thereby to increase the effectiveness of its gunners.

Trainers and/or simulators have become indispensable in a number of training programs, e.g. in antitank and antiaircraft units.

All in all, developing the right approach to this type of training equipment is becoming more important all the time. It will determine to a large extent whether commanders will make sure that the equipment is used enough, whether it is well maintained and always ready for operation and whether the soldiers themselves will train on the equipment with the proper enthusiasm and intensity.

Based on their experience with this type of training equipment, some units and commands have worked to overcome some of the reservations resulting from the fact that a given piece of equipment cannot in every instance duplicate all the functions and operations of the original. Those are the units and commands where proper work is being done today.

Success is achieved particularly in those instances where commanders and communists support all ideas for added, conscientious use of training equipment and simulators and focus the attention of innovators' movements on these processes.

5. Solidifying Socialist Relations in Military Collectives

During the past few years we have found again and again that mastering scientific-technological progress in military matters calls for further solidification of socialist relations within the military colllectives.

In this context, commanders and party organizations have been placing stronger emphasis on the establishment of stable socialist relationships and the maintenance of firm discipline.

We can now say that relations within the military collectives, jointly mastering the technology, have developed well. Typical examples of this are to be found in teamwork and mutual help in squads, crews, operators and maintenance units.

Experience has also taught us that relationships inside a military collective, which to a large extent are determined by cooperation in the operation of weapons systems, must be consciously strengthened through the entire term of service by the most varied means. This can be achieved with the help of goal-oriented political programs, concern for the needs of the individuals and substantive cultural-political work.

In the ground forces, there is a growing trend to form groups of specialists and to provide separate training for them. This reduces the time in which the full complement of the collective working together might solidify socialist relationships and in which the unit commanders and the party and FDJ organizations could exert a direct educational influence on them. Particular attention must be paid to this trend in preparing political programs.

At the same time, the process of specialization runs more and more counter to the possibility of replacing one soldier by another on a given piece of equipment. This is why it is becoming more and more important to develop organizational structures and initiatives which aim for more flexibility in this regard.

6. Intensifying Understanding for Military Economics

The man-military equipment nexus is also becoming more and more important from the standpoint of military economics.

The military collectives are making great efforts to translate equipment and budgetary resources into combat effectiveness through goal-oriented and efficient programs. This particular aspect makes it plain just how much understanding among communists, commanders as well as all members of the armed forces and the civilian employees has grown as regards the economic policies of our party.

If we manage to intensify this understanding further, we will be able to effect additional savings in fuels and lubricants; in coal and energy; in more regeneration of modules, componenst and tools; in the optimization of plans for vehicle use and the targeted utilization of standards and limits.

It goes without saying that the success of any such measures depends to a very large extent on the relationship between man and technology. This is even more true as the growing complexity of the technology continues to increase its value.

More and more, conscientious adherence to technical standards and to operating and maintenance instructions as well as safety regulations are having a definite impact not only on the combat readiness of the armed forces but also on the military budget.

It is becoming increasingly clear that discipline in dealing with the technology is of major economic importance in this context. More than ever before this new type of "technological discipline" calls for greater reliability, accuracy, punctuality and independent initiative.

This, in turn, calls for major efforts in education on the part of all commanders who should serve as examples; for the influence of the party and the effectiveness of the FDJ organizations. There should be even greater competition in the conduct of such processes in military life. We should continue to develop our efforts in the field of military-technological propaganda with respect to the abovementioned tasks.

The 30-year history of our National People's Army teaches us the following:

We have always succeeded in mastering the increasing difficulties of military equipment because the party was always able to convince people of the necessity to preserve the peace and to motivate them to superior achievement and because it always saw to it that the armed forces of the working class received the type of military equipment which was in keeping with the times.

At this time, prior to the 11th party congress and the 30th anniversary of the NVA, we should take particular advantage of this historic lesson in our units and commands so as to strengthen the class positions, to enhance pride in our own weapons and to develop confidence in victory.

PROFILE OF HUNGARIAN 'MUVELODES' BEFORE ROMANIZATION

Budapest ELET ES IRODALOM in Hungarian 17 Jan 85 p 7

[Interview with Janos Kovacs, literary historian and acting editor of MUVELODES, by Erzsebet Almasi: "In the Service of National Identity: A Conversation in Budapest About the Romanian MUVELODES"; date and place not given]

[Text] Is it possible to direct the cultural activities of Hungarians living in Romania from Bucharest? To what extent is it possible, while sitting in the press palace of the capital city, to keep track of everything that is important for the readers and the public to know? What kind of a role does a periodical assume in shaping facts, the state of affairs itself, and reality? I could just as easily have put the questions in the past tense, too, since on the first of January 1986 the minority cultural organ entitled MUVELODES ceased publication. More precisely: it appears in Romanian under the title CINTAREA ROMANIEI (We Sing of You, Romania) and publishes only programs--for example, plays and choral works--in the Hungarian language. For 3 years the publication did not have an appointed chief editor; its last--already retired--director, the literary historian Janos Kovacs, recalls the past of the periodical.

[Question] Many considered MUVELODES the most useful Hungarian-language publication in Romania. It organized roundtable discussions, initiated competitions and sought out persons living in diverse regions, who were in fact doing something for the cultural life of their village or city. It published sketches of actors, reports of a sociological nature, technological and scientific reviews, all of those kinds of things which were of interest to most Hungarians living in Romania. Culture, however, is a broad concept. What fit into MUVELODES at any given time?

[Answer] The history of MUVELODES has been somewhat stormy. It started publication under the title MUVELODESI UTMUTATO [Cultural Guide], intending to serve as a guide on cultural subjects, publishing program information, plays, poetry, and songs. In the 1950s the chief editor at the time, Gyorgy Kisbenke, brought several writers and composers onto the staff, and with their cooperation produced a quality, high-standard publication. A period of crisis followed: 70-80 percent of the contents was translated into Hungarian from material in its Romanian-language counterpart; this was complemented by a few of its own news items and reports. An effort to change this situation succeeded in 1968, when the editors were given semi-independence, later full independence. Janos Andras, the chief editor, enriched the paper with new topics: he encouraged writings on folk art and the traditions of folk culture.

[Question] Why did this happen at /that/ time?

[Answer] Because interest turned toward the villages and the surviving folk culture. Unfortunately, MUVELODES was unable to rise above the so-called specialized administrative level on the subject; at times its articles were meaningless. Of course, amateur artistic and cultural activities are so diverse that it is impossible to determine the direction of divergent efforts with a few articles. At the same time, urban cultural life was neglected. In other words, they did not succeed in developing a proper balance. When in 1974 I joined the staff, it took several months to get my bearings before I, together with the members of the editorial board and with the help of outside colleagues, succeeded in shaping a profile from which the so-called specialized administrative articles were omitted. We tried to present the practical side of cultural activities.

[Question] What was the most important thing the paper had to say?

[Answer] We sought to make people realize that it is possible as well as necessary to develop Hungarian cultural life in Romania in the socialist spirit.

[Question] Was this not sufficiently obvious?

[Answer] We wanted to make our readers aware of its importance. We encouraged all types of cultural activities in the Hungarian language. Topics concerning folk culture filled 10 of the 68 pages. Nor did we forget the fact that the majority of Hungarians residing in Romania are city dwellers. In the villages of the Szekely region there has continuously been and even today there is a cultural tradition--this is less characteristic of the cities. Urban Hungarians listen to the radio, watch television, go to concerts, read, few of them become involved in amateur cultural activities; and this can also create the impression that Hungarian cultural life is less alive in these cities. But we did not limit the definition of cultural education to dilettantism. On the contrary, considerations of popular culture guided us in our approach to the theater or the fine arts, which, of course, differed from that of a specialized journal. For example, we examined the relationship between the theater and the audience or the effect of the theater on shaping national identity and consciousness.

[Question] I believe that one of your most successful series of articles was one which tried to give a picture of small-town cultural development.

[Answer] Most of the readers of MUVELODES are from small towns. Szekelyudvarhely, Segesvar, and Regen, for example, do not have professional performing ensembles or professional theaters; in these settlements the potential for amateur artistic activities are greater than elsewhere. There is also a greater need for them. We were curious as to what extent the residents utilize what we considered optimal conditions, and how much of this experience could be applied elsewhere; how could we dispel the old belief that small towns are the hotbeds of petit-bourgeois mentality or, if you prefer, provinciality. In many cases it became obvious that one can't speak about such phenomena any more. Thus, there is no petit-bourgeois atmosphere prevailing in Csikszereda, Szekelyudvarhely or Lugos. People are more openminded and predisposed toward new things; they are able to overcome self-complacency, which is one of the greatest dangers to culture in small towns. The other important series of articles was about the "villages on the move." The new environment changes the cultural demands of people who relocate from the village to the city. Or, perhaps as a consequence of the relocation, the demand for culture is pushed completely aside. At the same time, urban culture is gaining ground in the village, in the form of theater, poetry readings, radio and television use, sinceculture is transmitted via mass media.

[Question] Still the "quiet laborers" of culture, those who operate beyond the spot-light of public recognition, are mostly teachers and instructors.

[Answer] The teacher has always been the caretaker servant, day-laborer, and beacon of cultural life, especially in the villages. What is more, in Romania, in the villages and in the cities alike, it is the schools which provide the institutional framework for the cultivation of Hungarian language and culture. But I recall, for example, that we published a report about a cabinet-maker from Pankota, who established a regional museum, complete with a large bird collection. And, if my memory serves me right, the head of the theater group in Nagybanya is an engineer.

[Question] What kind of situation report would you give about the present state of Hungarian cultural life in Romania?

[Answer] I think that we must differentiate between the two characteristic forms of cultural life: community and individual. The extensive individual cultural life in the cities complements the emphasis on community cultural life in the villages. The former is immeasurable; perhaps only the number of theatergoers and readers of books can give an indication. But, even though people read the new books and make sacrifices to be able to attend the theater, they also play the violin and listen to records at home. This also contributes to self-development, to self-education. Occasionally the results are spectacular. I believe that during the 1970s MUVELODES gave a sufficiently faithful picture of the foundations and renewal of Hungarian cultural life in Romania. Nevertheless, the possibilities have not been exhausted; this is indicated, among other factors, by the fact that, according to official surveys, the participation of Hungarian amateurs in the series of national cultural celebrations called MEGENEKLUNK, ROMANIA (We Sing of You, Romania) remained below the national proportion of Hungarians. If we start with this piece of information, then the picture is not heartwarming. However, numbers do not tell the whole story. The quality of activity can redeem the lack of quantity. To mention a characteristic and perhaps often mentioned example, in recent years in Illyesfalva in the Szekely region amateurs performed a Shakespeare series. The very fact alone that they undertook something like this in a Szekely village tells a great deal about the cultural demands and standards--regardless of the artistic quality of the performances.

[Question] To what extent was the Hungarian speaking reader able to get information about cultural achievements from MUVELODES?

[Answer] We regularly reported on events which were examples to be followed: how, for instance, cultural work was proceeding in a large factory in Ploesti, or elsewhere. We reported the experiences of Romania's peoples' colleges, information about joint Romanian-Hungarian programs, and even our [Romanian-language] counterpart turned to us for material. Of course, there is never enough of such mutual exchange of information, but the opportunities are there. In any event, our primary job was to write about Hungarian cultural life.

[Question] Finally then, what was your "personal stamp" on the paper?

[Answer] I wanted to make an open publication out of MUVELODES. We did not close ourselves off from anything which promised to be effective and enriching from the point of view of national-nationality self-identity and individual self-realization. My individual ambition also contributed to this a little. I wanted to prove that it was possible to do more with a periodical than what our press had generally done. I was glad to receive all of those types of articles which brought to the surface the fact that people want to preserve and would like to strengthen their national consciousness. But we must not forget about the fact that human consciousness incorporates not only an affiliation with a particular nationality, but also the desire for universal cultural development, and the desire for self-expression and self-development. This approach determined what I considered important or unimportant among the incoming manuscripts.

[Question] Among the contributors to your publication, we could also read, for example, the name of Tibor Toro, an atomic physicist from Temesvar.

[Answer] When I arrived at the paper, a good portion of the outside contributors regarded popular culture, and specifically amateurism, as a third-rate interest. It was difficult to overcome this attitude; we looked for a long time for those contributors who were willing to sacrifice their time in order to acquaint themselves with the facts and then to write down [their ideas] in an exact and carefully considered manner. Many outstanding figures of Hungarian intellectual life in Romania--including the natural scientist Tibor Toro--published in our paper; and, as one of the consequences, members of the younger generation regarded it as an honor when we asked them to contribute to our publication.

BOOK REVIEW ON HUNGARIAN-SPEAKING POPULATION IN MOLDAVIA

Bacau ATENEU in Romanian Nov 85 p 10

[Article by Petru Fartade: "On the Origin of a Moldavian Population"]

[Text] The book The Origin of the Ceangai of Moldavia by D. Martinas, published 1985 by Editura Stiintifica si Enciclopedica, with the collaboration of I. Coja and V.M. Ungureanu, treats a fragment of the uneasy history of the Romanian people that includes many unexplained pages. One such page, undoubtedly, is the ethnic-historic origin of the Ceangai of Moldavia. Uncertainties about this group of Romanian citizens persist because, in some scientific circles, it was felt that they were not a part of our national history.

In undertaking this work, D. Martinas was inspired by the idea that a presentation of some historical data regarding the inhabitants of the regions of Moldavia, who are known as "Ceangai" or "Hungarians", would be an act of lofty patriotic duty and an obligation of conscience, deriving from the primordial question: Who are they?..."a separate stock" or a "Hybrid"?...since, as a Ceangau himself, he has always felt Romanian. Looking at it another way, he was convinced that to furnish the present with data on the ethnogenesis of the Ceangai as well as on those specific traditions and customs that have been preserved until our own day would mean to project a ray of light on their history with a view to elucidating a long-standing controversy. The latter has centered on the non-Hungarian phonetic system of the Ceangau dialect, as shown in the author's argumentation based on an analysis of results (including those of Hungarian investigators). Such conclusions, along with many others that appear in the work, have led I. Dumitriu-Snagov, the author of the book's introduction, to say that D. Martinas has produced "an admirable synthesis", "a stimulating systhesis", with a view to elucidating a probem that persists in the mind of some that the Ceangai are an "historical enigma".

The book consists of three chapters, of which the first two, "Historical Aspects" and "Linguistic Aspects", occupy the major part of the work. Tacked on to them is the final chapter entitled "Notes and Commentaries" by I. Coja and V.M. Ungureanu. The same I. Dumitriu-Snagov attaches particular significance to them for their "particular accuracy is not changing the content and in preserving the form evolving over the years of work". The desire of the collaborators was, undeniably, to put together a work that would constitute, both for the experts as well as for the public at large, a working tool, an invitaation not only to think but to draw attention to the Ceangau phenomenon, so often forgotten or ignored, even by those who investigated them.

In the first chapter Linguistic Aspects, the author presents diverse theories regarding the origin of the Ceangai, their ethnic conscience, the origin and significance of the name Ceangai", their customs and dialect, as well as numerous other historic-ethnographic aspects. The author succeeds, on the basis of impressive bibliographic material, in deflating hyptheses of the allogeneous origin of the Ceangai that have long been dominant both in Hungarian research and in our own. This population is not as homogeneous as one might think and does not live in a unified geographical area, but rather is dispersed among a large number of fellow countrymen, with the other components as brothers. The Ceangai proper, who are to be found along the middle basin of the Siretual River, both those whose current mother tongue is Romanian and those so-called "bilinguals" who make equal use of the Romanian language and their Hungarian dialect, originate in an old Transylvanian Romanian population, according to the author, that was probably "Szeklerized" [Hungarianized], between the 13th and 18th centuries and subsequently emigrated to Moldavia as part of that enormous socio-political phenomenon from Transylvania known as the "Profugium Valahorum" [the flight of the Wallachians] (D. Prodan). From the documents presented by D. Martina, it turns out that they are not a Hungarian population that had become denationalized and recently assimilated by the Romanians of Moldavia, as had been claimed by some foreign investigators. The hypothesis that the Ceangai are the result of "the complex process of forced Szeklerization", both from the linguistic point of view as well as the religious, is argued with historical facts that must be taken into account, manifesting the process of denationalization begun in the feudal Hungarian state via its institutions (the church, army, school and feudal lords). The resistance of the Romanian peasantry, which became dramatic, culminated in gradual ethnic pressure and the abandonment of the native districts. In these conditions the official language and faith prevailed, in the linguistic sphere, as D. Martinas notes in the chapter Linguistic Aspects. But the Ceangai, unfamiliar with the Hungarian language that uses a phonological system totally alien to their own speech, developed their own hybrid dialect that was "broken" in comparison to the official language. This was not to the liking of the real Hungarians and Szekler, for which they were stigmatized with the epithet "csangok"; in fact, in their speech, Hungarian words are mixed with many native Romanian words. The linguistic material presented by D. Martinas, following assiduous research in almost all the Ceangai villages of Moldavia, leads to the conclusion that they "speak a Romanian dialect of the Transylvanian type", not Moldavian, which proves that they did not learn Romanian in Moldavia but rather in Translyvania where they had come from during different historical periods. In arguing his hypothesis, D. Martinas proceeds from the specific linguistic aspects of the Ceangai dialect, concerning 2 viewpoints, both of real scientific interest: first, the historico-linguistic, in accordance with which the population is Romanian, originating in Transylvania; the other, the purely linguistic aspect, which considers the Hungarian influence the direct product of the process of Szeklerization, illustrated in the speech of bilingual Ceangai. The dialect of these latter cannot plead for a Hungarian origin, since it is far from that Finno-Ugric tongue, as is seen in the description of the Szekler missionary Petru Zold when he writes about them: "They all speak Romanian and Hungarian, but they speak Hungarian very badly". Going on, the author deals with phonetic and lexical problems, drawing the reader's attention to a rich trove of material from the study of events to which we are referred as well as field work carried out in support of his hypothesis.

The corpus of Notes and Commentaries, covering 152 annotations carefully selected and organized by V.M. Ungureanu, is testimony to the enormous effort expended by the author to prove his theses, and provides the reader direct access to the sources that elucidate the so-called "enigma of the Ceangai". The work is accompanied by a postscript by I. Coja that is of particular interest for understanding both the conclusions reached by the author and the need for continued research in the area of the Ceangai to remove uncertainties that still remain.

D. Martinas's book stands out both as the fruit of passionate work carried out over several decades that fills a much felt void in our historical and linguistic literature, and tackles the problems through a felicitous supplement of historical and linguistic documents together with remarkable interpretations containing new hypotheses and ideas. Even if some of the latter are susceptible to criticism by the experts, they will undoubtedly remain an important contribution to the decipherment of a void spot in the history of our people.

SEVERE PENALTIES URGED FOR GASOLINE HOARDING

Bucharest INFORMATIA BUCURESTIULUI in Romanian 27 Dec 85 pp 1, 3

[Article by V. Voiculescu and R. Duca: "Unyielding Opinion, Firm Measures Against Those Who Disrupt Service at PECO Stations"]

[Text] Excessive consumption--above normal, reasonable levels--often indicates speculation and illicit profiteering. Stockpiling gasoline at home presents a grave risk of accident and fire. The law provides severe penalties for those who cause disruptions in services.

Normally, driving during the winter is significantly reduced as many automobile owners do not use their cars for short drives, especially within the city. This is a fact that the statisticians in the motor vehicle departments in the militia can attest to. A large number of automobile owners avoid the increased risk of accidents that is linked to the rigors of wintertime driving. It follows then--and this has been the case in all past years--that the decrease in auto traffic during these months should be accompanied by a corresponding decrease in demand for gasoline. Yet, paradoxically, the PECO stations recently have been the scene of long lines which in turn has caused disruptions in normal gasoline sales. This despite the fact--and this must be noted from the outset--that the quantity of gasoline available to motorists has been and continues to be greater than the demand during similar periods in previous years. Thus, there is an appropriate supply, that is to say, sufficient amounts of gas given that the problem of ensuring quantities of fuel is not a simple one, that petroleum stocks are limited and that we must strive in all sectors (including private vehicular traffic) to be reasonable in using those stockpiles and in conserving them.

So it is with good reason that we ask: "If automobile driving during this period is less than normal, what is behind the sudden surge in gasoline consumption?" From the start, there is an unmistakable conclusion: the disruption in normal supplies at PECO stations is because certain automobile owners purchase more gasoline than they need; the surplus is intended for speculation. Through their irresponsible attitude--indeed anti-social at times--these "octane collectors" do harm to the interests of the rest of the citizens who understand that they are to purchase gasoline only to meet their needs. Not once, but several times we were able to observe how these hoarders operate--they fill up their cars several times a day--at the same PECO station or at different locales, then empty their tanks into any kind of container. In this way, they transform their automobile trunks or their homes into veritable--and very perilous--gasoline storage facilities.

Alerted by the recent excessive gasoline consumption, the PECO management has implemented a series of measures including recording the license tags of cars which fill up at the gas stations. Using computers to analyze the data sent in by specially designated employees at PECO stations, grave abuses in gasoline purchasing have been uncovered.

Indeed, the above data has revealed some very undesirable records in gasoline consumption, selfishness and crass greed. For example, the PECO management told us about a single automobile--license number 3-B-5305--which in only 3 days was a customer at 7 different gas stations in Bucharest, purchasing over 300 liters of gasoline! We did some fast calculations--is it possible that the driver had traveled over 3000 km in 72 hours? That is hard to believe. Another automobile--2-B-8974--collected over 160 liters at just the Military and Alexandria stations and appeared in the records of the Oltenita station as having consumed another significant amount of gasoline. True, the car owner--retiree Mircea Huter (5 Paralutelor Street) admitted to purchasing only...160 liters and having a stockpile of only...40 liters. And why did he need such large amounts of gas? For various trips was his response. A response which quite clearly is unacceptable.

Of course, evidence of these reprehensible activities has been turned over to the militia and they are now under investigation. All implications and responsibility will be established in accordance with the law. Furthermore, as a result of militia investigations--prompted by the PECO data--many of the authors of selfish actions were identified promptly. For example, there is Mihalache Oancea (35 O. Cocarascu St.) owner of the automobile with tag number 7-B-5779. He is a team chief at the "Pajura" ICRAL who sent a subordinate, Costel Marciuc, to the PECO station. After filling the gas tank, he emptied it, and got in line to fill it up again. What did they say about this later? The boss said he did not know anything about his subordinate buying all that gasoline. The subordinate has a different story! All of this to try to cover up gasoline hoarding. Another "customer" at PECO stations is Ilie Tataru (28 Gazalei St.) who is employed at the Antrepriza metallurgy works and who owns the automobile with license tag 10-B-5725. Let's follow him around for a day. About noon, he fills up his car--which he has equipped with a reserve tank--at the 11 June service station: 43 liters. He empties the tank and in the afternoon he is once again a customer: 43 liters more. Once again he empties the tank, selling a full gas can to his boss, foreman Ioan Gheorghe, who, it appears, "did not notice" that his subordinate was absent from work. The next day the same I. Tataru bought gas again: 60 liters from the Alexandria service station. In 2 days he purchases 150 liters, part of which is found at his home, stored in...a chickencoup! In another case, Ion Chiriac (14 Monument St.) owner of auto, tag number 19-B-9842, filled his gas tank three times in a single day--over 120 liters--and the next day, in his basement, only about 20 liters remained. Is it possible that these cases of stockpiling are but compulsive reflexes of misers? Is it possible that the "transfers" that some of these people make from their own stockpiles are innocent ones, altruistically motivated? It is obvious that they are speculative and intended to make money. The authorities are acting firmly and relentlessly in these cases to punish those guilty in accordance with the penal code.

Furthermore, in addition to the unethical practices uncovered in these cases, such stockpiling can cause grave accidents at the homes where this is going on--fires with terrible consequences not only for the hoarders but for others who live in the same dwellings. This is why Council of Ministers Decision 2285/1969 categorically forbids such stockpiling which, because of the grave risk it entails, is severely punishable.

Thus these are despicable practices which provoke a chain reaction of abuses--beginning with unexcused absences from work, then creating the potential for fire and finally causing disruptions in service at the PECO stations where gasoline allotments are made based on strict necessity. It is in our interests--in the interests of everyone--that these unacceptable attitudes be severely punished and resolutely brought to a halt. Public opinion must act decisively to combat such detestable practices and to promote a moderate spirit of conservation which characterize each one of us.

CONTINUING PROBLEM OF YOUTH UNEMPLOYMENT REVIEWED

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian 10 Nov 85 pp 14-16

[Article by Dusan Sekulic: "Condemned to Idleness"]

[Text] Perhaps it is not easy to determine which is a more serious problem for this society, debt or unemployment. On the other hand, however, it is quite easy to conclude that both are consequences of the same type of irrationality, and that both will cost the new generations much more than those whose chosen representatives have become famous by putting a sort of double noose around the necks of their descendants. Repayment of the debts is being left for the future, the generations to come, while the members of those generations are being prepared on a massive scale for social incidents, since it is still quite unclear how they are to be given an opportunity to solve the basic question of existence, and to work. Today Yugoslavia, with a million unemployed, i.e. 15 percent of the total number employed, is the inglorious European record-holder in this respect. The most serious thing about it is that 77 percent of the unemployed are younger than 30.

The fact that both the Central Committee of the LCY and the Serbian Central Committee dealt with this issue last week shows that society is becoming aware of the seriousness of the facts, and so, if these forums cannot be credited with devising a magic formula to eliminate unemployment, the unemployed can at least take comfort in the fact that they have not been forgotten. This should, however, by no means create for them a false hope that the end to the problems will come soon. Unfortunately, there are still no real solutions.

Just as in the case of foreign debt, a bitter paradox is presented by the fact that Yugoslav citizens keep more than $20 billion in private accounts in domestic and more often foreign banks, so in the case of the unemployment issue as well, it is an unusually painful fact that Slovenia has the lowest unemployment rate in Europe, and that with 42.3 percent of the total number of inhabitants it is equal to the most developed countries, while at the other extreme in Kosovo only 11.6 percent of the total number of inhabitants are employed. Now, when it is more than clear that among us there are both those who know how and those who have, what else can one conclude except that there is a lack of common sense, organization, correct decision-making...

The main prerequisite for correct decisions is true facts, but we do not know precisely today how many people really are unemployed; it is estimated that at least 20 percent of those registered are misrepresenting themselves. Even less is known about how many of the approximately 6.5 million officially unemployed would remain without work tomorrow, if normal economic criteria existed.

How to Employ

"We think that among the million unemployed people registered on the lists, from 10 to 30 percent are registered falsely," says Zdravko Krvin, a member of the Presidency of the Council of the Yugoslav Federation of Trade Unions. "We will go through the records in all of the opstinas in the country by the end of the year, so that we can know the real state of affairs once and for all."

One cannot deny that correct information about the number of people unemployed is significant, but the finding of this information is the only concrete thing that can be expected to be done soon in connection with the issue of unemployment in Yugoslavia. It is not clear today how to achieve full employment on a social scale, or employment that could at least be called normal. Those who know a solution do not know how to remove the insurmountable obstacles to that goal. Political action remains at the level of issuing declarations and repeating the depressing statistics.

If the unnaturally rapid employment of the previous decades was almost exclusively a consequence of the also unusually large investments, now, when there is no domestic capital formation, and its replacement by new foreign credits has become impossible and inaccessible, how can new jobs be created? From 1981 to 1985, however, 1,075,000 new workers were employed, 532,000 as a replacement of generations, "natural outflow," and another 543,000 people as true new employment. At the same time, though, the productivity of labor fell, there was an even more pronounced leveling, there was a fundamental reduction in the incentives for labor, and, worst of all, real wages declined by almost half. These facts, in any economically logical thinking, automatically rule out a solution through new "artificial" employment, in accordance with the logic of solidarity applied to socialist society, in which even poverty should be equally distributed, since "it is better to have any job and any wages, than to have nothing." Such a course, which is after all a common one in "real socialism," where there is "full" employment, is not being seriously considered by anyone today, except for the unemployed themselves. In their fear of "social tensions," the bureaucracy and the power centers would probably be more inclined toward this type of demagogy, even though this would mean postponing the explosion until a later time, with much more serious consequences.

Everything for Work

"We in the Trade Union see a solution for unemployment in the utilization of several different possibilities," Zdravko Krvin says. "Above all, there is a potential in making better use of the existing capacities, and shortening the working hours in individual industries. Next there are small business, agriculture, tourism, changing seasonal workers into permanently employed ones with a shorter total working time, domestic crafts... and in general, every working activity that offers a possibility for supporting oneself. Just look at the situation in small business: each of the 600 opstinas in Yugoslavia has some policy of its own, and practice differs as if it were a question of different worlds."

"For me, unemployment is absolutely the first economic-political and social problem of Yugoslavia," says Berislav Sefer, a delegate to the Yugoslav Assembly, who is well known for his original approach to social trends. "A further increase in the kind of unemployment that we have would bring unforeseeable consequences, since our unemployed are better than the average people who are employed: they are young, educated, and quite certainly more motivated to work and change their lives for the better. So far, all the conclusions and resolutions on unemployment have not crossed the threshold of abstraction. It is important to understand that unemployment can only be eliminated with healthy social relationships. What we are doing now -- about 200,000 newly employed each year, with a decline in productivity -- is a dangerous tactic. Where are the ways out? If today we have a use of industrial capacity of about 65 percent, it is improbable that it cannot be better utilized, regardless of the excuses that there is no energy, raw materials, market... This does not fall out of the sky for others, either. This dead capital, paid for with expensive resources for whose repayment we are now suffering, is simply crying out for a new initiative, for new ideas that would revive it. The mistaken investments, the expensive imported equipment, worth at least five and maybe as much as ten billion dollars, are now practically lying as scrap -- and isn't it true that with new organization and new installation it could be made productive, and new jobs could be created? But for all this purpose and ideas are needed. The same forces who created the "Fenije," however, are now maintaining an atmosphere of verbalism, fear of changes, a psychology of survival, instead of ambition and progress, since this is the way for the bureaucracy to keep power.

Shorter but Better

Of the practical and immediately available opportunities, Sefer now sees a chance for new employment in shortening working hours.

"If it has been proven in practice that shortening working hours for difficult work has contributed to a significant increase in productivity, then it is really improbable and incomprehensible that someone has opposed this," says Sefer. "And so people are still insisting on shortening working careers, on new retirees who we are far from being able to pay, instead of extending a person's working life, with shorter working hours, and making more productive work possible for him. In that way we would also find a place for the young ones and save society a new burden."

One of the most insistent advocates of shortening working hours is Marija Todorovic, chairman of the Labor Committee of the Serbian SR:

"We seem to be striving persistently to avoid facing the truth in life, and instead we are living in a world of illusions and delusions," Marija Todorovic says. "At one time we raised a big fuss about the so-called hybrids, the people who have one foot in the factory and the other in the field. And recently, at Zmaj, I heard the question, 'Why don't those who have land give up their jobs?' Then why don't those who have apartments to rent and money in the banks? Today we should be happy about mixed households, since if there were none there would be millions of social incidents. But when our half peasant, half worker wants to harvest wheat or pick corn, he has to take sick leave, to lie, to act like a social parasite -- for the sake of work that is actually very beneficial to society. All of this is because our labor legislation, and in general our view of labor relations, are at the level of some long obsolete period, contrary to the fundamental determinations about the free association of workers. Why don't we make it possible for such a worker to have a labor relationship in which it will be stipulated in advance that for several months he will not work at a machine because he will be working in the field? Why is it that in capitalism it is possible for a woman, a mother and a housewife, to be that and also work for four hours, and in socialism it is not possible? How many thousands of jobs would we obtain in this way? The fact is that in a large number of cases our people do not rush into the socialized sector just in order to receive a personal income, since it is likewise obvious that many people would not be able to live on that personal income. It has to do with the rights related to the labor relationship: health, social, and retirement insurance, the right to an apartment, and a nevertheless enviable amount of security compared to any private initiative in this society which changes the guidelines every hour. The fact is that among the 270,000 unemployed people registered in Serbia on the lists of the SIZs [self-managing interest communities], more than 60 percent are from villages, i.e., most have some sort of economic support. I am convinced that the introduction of retirement insurance for peasants and health insurance for the entire population, without any differences, will essentially reduce the pressure on employment."

The More Work, the More Rights

Marija Todorovic also thinks that the resistance to shorter working hours is unreasonable.

"Even if one can understand a certain amount of astonishment, and sometimes even resistance from management bodies in the economy to demands for the establishment of three shifts, because of a shortage of energy, raw materials, marketing, organizational problems, and other complications, there really is no justification to the resistance to having three shifts last a total of 18 hours, i.e. only 4 hours longer than two shifts now. All those who have shortened their working hours in difficult jobs have achieved extraordinary results in increasing productivity and quality, and reducing sick leave. The fact is that sick leave is most frequent for employed people up to 27 years old. It is no wonder, if a young person goes to a job as something that always begins before dawn and continues inflexibly for a set time, with formal presence being the most important thing. I support the principle of having the worker himself determine how much he will work, but also having his labor relationship rights depend on this. For a little work -- just social and retirement insurance; for maximum work -- also a personal income and a right to an apartment, for example.

"In regard to unemployment among young people, I think that society is not active enough concerning this almost tragic fact," Marija Todorovic feels. "Postponing employment until after 30 also means postponing life; it means losing the best years for beginning the creative period of life, for the natural reproduction of the population, and all of this causes irremediable and unforeseeable harm. I would express what should be done in a sort of slogan: the entire population capable of work, plus the entire material wealth of society, for the entire younger generation. One should by no means think that youth can be employed in the present organizational scheme, in the present way. From the opstina to the federation, all existing and still undiscovered possibilities for employment should be investigated, and investigated every day. It is clear that the socialized sector of the economy, industry, cannot take in everyone who comes. But instead of investigating new possibilities, in which the main criterion would be having someone work, ensure that he is able to support himself, and cover his rights arising from the labor relationship, and not what he does or how, we are pettily devising new methods that determine or prohibit work for someone.

"I have a recent example. I suggested to the appropriate services that they somehow legalize the work experience of those women who have been taking care of children for decades, part-time, for 5, 6, or 8 thousand a month per child, doing the parents an invaluable service and ensuring some sort of income for themselves. And do you know what happened? Our lawyers created a draft regulation specifying that these had to be at least women who had qualifications as nurses, and that nursery schools had to accept them for a labor relationship -- all of this without any relationship to real life, and absolutely the opposite of the original simple idea: a woman works; why isn't her work experience regulated? There is no telling how many jobs like that there are. Thus, we had barely won private individuals the right to open bookstores, when the opstina officials greeted them with so many taxes that now the Serbian Executive Council has to intervene in order to save them. To put it simply, we have to create conditions in which a person who works is a patriot," Marija Todorovic concludes.

Dogma and Life

The extent to which social consciousness is burdened by traditionalism and a truly irrational dogmatism was perhaps best shown recently by the case of the so-called law on purchasing jobs -- the nickname maliciously given to a regulation governing the investment of the foreign exchange funds of returnees in the creation of new jobs, with the investor being given preference in employment in the job that he created with his funds. From the criticisms of the draft law expressed by the youth organization through the Presidency of the SSOJ [League of Socialist Youth of Yugoslavia], above all a fear was made public that this was a road to the vampirism of capitalist relations, stockholding, and that it was essentially unjust. As if it were essentially just when someone comes from Germany with 50,000 marks and looks for work, while someone else has neither work nor marks! Aren't they very much unequal -- but that is life. Is it really more sensible to induce the returnees to leave their money in foreign banks, from which we later obtain credits that smother us, instead of investing it in our economy, which is crying out for new technology? Is it really better for a person to build a house with an elevator at the end of a muddy street than for him to "buy" his daughter a job and a machine at a clothing factory? Questions like this could be asked endlessly, and all in order to prove that we as a society are still living in some other spheres, in some promised or invented world, not acknowledging reality, and consenting to have those who fear for their positions label every indication of reality as a heresy.

If anything has real prospects for dispelling the mirage and exposing the cheap illusionists, it is the unemployment of young people. To put it simply, they will tolerate this to some limit, and then they will not. If this is certain, as indicated by all the experiences of both the past and the present, isn't it better and more advantageous to wake up from a false dream while the alarm clock is still ringing, than with the aid of coffee that is just water? Even if in that case someone is left without a blanket...

RELIGIOUS UNDERGROUND, STATE CONTROLLED CHURCH VIEWED

Zurich DIE WELTWOCHE in German No. 4 23,Jun 86 p 11

[Article by Thomas Seiterich: "The Holy Father Feels Linked to Us Czech; a Religious Underground Develops in the CSSR in Addition to the State-controlled Church"; first paragraph is DIE WELTWOCHE introduction]

[Text] Churches and Charter 77

In Czechoslovakia more and more citizens withdraw with resignation into their private lives. The ruling communist party in vain seeks an attractive vision of the future. Solely the churches and the Charter 77 civil right movement are able to mobilize people--the church in part also in the underground. Lay priests preach on "mountain hikes," illegal periodicals come into being in various cities, the official church believes it is being monitored by the state security service.

For 35 years true ecumenicity in Czechoslovakia has been taking place in the prisons, "a pensioner told me who on account of his involvement as an active Catholic has spent 14 years in communist prisons and penal camps." Following the occupation of Czechoslovakia by Hitler Germany the man was detained by the Gestapo for years as a Czech patriot and resistance fighter. Today he is a member of the Charter 77 civil rights movement. "I got to know many of the leading civil rights activists but also, e.g., our present state president, Gustav Husak, in prison. Husak was in prison under Stalin. He was extremely withdrawn towards his fellow prisoners and suffered as a communist under the treatment accorded to him by communists."

Officially the state does not like the ecumenicity among the Christian denominations in the CSSR: "The church secretaries, who watch over every clergyman and see to it that church activity is limited to worship services which are permitted to be conducted only in so-called worship rooms, prevent ecumenical togetherness fearing that uncontrollable events could ensue." All the more lively," my partner in the conversation reports, "is the ecumenical conversation in the prisons. There ecumenicity does not stop at the dividing lines of the churches but it also includes the skeptics, the agnostics and the imprisoned atheist communists. Therefore theology here in Czechoslovakia is devoid of bad enemy images and also free of a spiteful anticommunist emotion. Too bad that this fact is so little known in the West."

"The Catholic Church operates along two lines. The first line, that is the official church supervised and controlled by the state. That are the priests authorized in their parish by the state and the public worship services, also the homes for handicapped in which a very few sisterhoods are still tolerated. Behind that," according to a female partner in the conversation, "a so-called second line operates outside the very narrow legality limit for church activity drawn by the communist state: This church underground consists of lay groups and priests who, secretly consecrated, are not known to the state. These clergymen as a rule work in worker occupations or are pensioners. They work in a manner similar to that of the worker priests in the West."

"Many of our secret priests studied theology in the 50's and were put into the army or in prison for years from the theological faculty. Each of the country's big cities has more than a dozen of these secret clergymen. The organization of the second line," according to our female partner in the conversation, "is, however, decentralized and lies in the hands of laymen." Laymen publish underground periodicals; on the table in front of us there lies "Informace o cirkve," Information on the Church, which is regularly published with a circulation of about 1000. The periodical is put together in several cities, copied and then distributed over the entire country from hand to hand. It contains news on the world church, but especially theology. In the issue that lies before us there is a theological article translated into Czech on the Charismatic Movement, authored by the West German theologian Heribert Muehlen."

The work for an underground paper is risky. "State security of course knows about these periodicals. The penalty facing the collaborators is two years' imprisonment. Now and then one of the editorial groups is busted; however, the sentences recently have always been suspended and the defendant placed on probation," our female partner in the conversation reports.

"While in the countryside in Bohemia and Moravia church life has declined in many places and has shrunk to communistically controlled Sunday worship services, in the cities there are more and more active Christian lay groups, so-called action groups."

The group headed by our conversation partner meets every two weeks alternately in the homes of the 12 members. Most of them are young married couples. At the meeting the Gospel is read, open prayers are said, news is exchanged and theological education imparted. Other groups whose membership consists especially of students and persons to be trained have developed other forms to get together. Now and then they go on "hikes in the mountains" which are nothing but days of meditation led by priests.

Many of the young Christians who are active in the second line learn or speak Polish. From Poland they get prayerbooks, periodicals and theological literature. The news from the world churches for the most part comes from Austrian radio.

Our female conversation partner enthusiastically reports on the big pilgrimage to the Velehrad on 7 July 1985. "Velehrad, there 250,000 Christians provided a direction for the new start of the church. When the communist minister of culture wanted to deliver a prepared speech, the believers interrupted him with catcalls and laughter. The people pressed the top functionary into holding an open unprepared dialogue and cornered him with questions on freedom of religion, freedom of information and human rights. Since Velehrad, a new self-confidence has grown among us Christians. There is a broad new religious start: The churches have not been so full for decades as they were for Christmas. The number of lay groups is growing."

Cardinal Frantisek Tomasek, the archbishop of Prague, resides in a Maria Theresia-yellow renaissance palace on the Hradcany Hill, directly across from Czechoslovak State President Husak.

The cardinal, a sprightly 86-year-old, during the conversation turns up the portable radio on the table to full volume, so that the secret monitors of the communist state security service will at least not be able to listen in on every single word.

In response to the question of what caused the mass pilgrimage on 7 July 1985 to the grave of the apostle of the Slavs, Methodius, the cardinal said: "All the world could see how many deeply religious people there are in our country, that not only old people publicly profess their Catholic faith and your loyalty to the church but that there are also quite a number of young people who do so. Two-thirds of the pilgrims were young people. That is new and that gives courage for the future." Tomasek reports how much the present pope means to the Catholics in the CSSR: "The Holy Father is closely linked to us. He understands our situation and is close to us. I have never experienced him to be excited, nervous, unsure--always self-assured and calm, full of optimism and confidence. That is the way the communists have to be faced." The cardinal, measured by the rules applying otherwise in the world church, is over 10 years too old to perform the duties of the administrative office of his diocese. Tomasek: "I am old and I wait for my successor. But on account of the siutation between church and state here, it is at this time not possible for the Holy Father to appoint a successor."

HUSAK REGIME TOLERATES SERIOUS ALCOHOL ABUSE

Zurich DIE WELTWOCHE in German No 1, 2 Jan 86 p 9

[Article by Inge Santner: "For Us Beer is Like the Daily Bread; The Husak Regime Tolerates Serious Alcohol Abuse in the Country--the Little Bit of Freedom of the Czechoslovaks"; first paragraph is DIE WELTWOCHE introduction]

[Text] Too Much Blood Alcohol

The alcohol problem in Czechoslovakia is serious: In 1983, by statistical proof, 1926 Czechs and Slovaks died from the direct consequences of alcohol abuse. The financial harm resulting from alcohol-caused loss of working time amounts to a calculated 66 million francs a day. In spite of that, the Prague rulers do not want to follow in Kremlin chief Gorbachev's footsteps, who has declared war on alcoholism in the Soviet Union.

With all the required respect for noble Soviet models, this much is absolutely definite for the Prague rulers: they loath the Gorbachev campaign against alcoholism. They have no intention of imitating it.

Even Comrade Vasil Bilak, who is recognized as the man most loyal to Moscow in the CSSR Politburo, does not by any means want to get involved in this issue. His response to the question whether at least the enormous beer consumption in the Bohemian areas ought not be reduced just a little strongly rejects the idea: "To us beer is like bread," he says.

It is acknowledged that communist Czechoslovakia would have more than enough reasons for an anti-drinking campaign. Admittedly, the vodka consumption stays within relatively modest limits and also the consumption of other hard drinks up to and including the allegedly all-around healthy Slovak juniper gin Borovicka. In their place the national beverage beer literally flows like water.

The latest statistics were quite impressive. By official count, in 1983 1926 Czechs and Slovaks died as a result of the direct consequences of alcohol abuse. The financial harm as a result of alcohol-induced losses of working time added up to a daily 302 million korunas (according to the official rate of exchange roughly 66 million [Swiss] francs), whereby the average daily output of a worker was estimated at 850 korunas. Forty-seven percent of all felonies (murder, robbery, bodily injury) and 58 percent of all rapes were attributable to alcohol.

Every CSSR citizen--counting great grandmothers and babies--in 1984 consumed exactly 154 liters of beer, 10 liters of wine and 6 liters of liquor. His intoxication cost him easily 1572 korunas (equals 19 percent of his total expenditures for food), while he plonked down a mere 156 korunas for non-alcoholic beverages.

The alcohol problem has become so explosive that lately the newspapers, too, are dealing with it. The party newspaper RUDE PRAVO, e.g., recently published a pertinent report on the public mood from Roznov pod Radhostem, a small town south of Ostrava, which starts as follows: "The saloon (Sestka) is jam-packed, some customers must stand. All in all about 60 people are assembled here. Heavy half-liter glasses bump into one another. The men first blow away the beer foam and then become immersed in the golden brew with evident satisfaction. It is just 9 AM. The men wear overalls or other work clothing. Tool bags can be seen here and there. The beer flows and flows from the barrel without interruption. The haste with which the waiter moves through the crowd indicates that the daily morning whirl has reached its peak."

Why does the government keep quiet in spite of that? Why does it give the cold shoulder to the Soviet champions for a sober Eastern Europe and signals a resolute "without us" to big brother Gorbachev? Greatly varied motives come together here. Superficially what is involved is the credibility of the ideology. As orthodox communists the men around party chief Gustav Husak stubbornly adhere to the obsolete theory long since abandoned elsewhere that alcoholism constitutes a relic of the bourgeois era and that in the healthy air of socialism it would sooner or later disappear by itself. According to the Morgenstern theory that things cannot be that must not be, they ignore their drunkards even though their number doubled during the past decade.

Of course more important are hidden considerations. They concern no less than the stability of society. After Husak had purged about 460,000 comrades eager for reform from the Communist Party after assuming office in the spring of 1969, and otherwise had turned everything upside down, he finally wanted calmness, nothing but calmness. And that is precisely the same what he wants today. His entire policy of normalization stands and falls with it.

Plenty of Opportunities Available for Drunkenness.

To put it another way: Husak needs a largely passive population which pretends a measure of agreement with the party, i.e. participates in some indispensable manifestations of communist loyalty and waves a goodly number of red flags on 1 May. In return he provides the population with the opportunity for a largely unhampered private life on a relatively good material level, which includes the weekend house as well as the beer glass. Any intervention in this regard rightly appears to him to be extremely risky because it would be destabilizing.

The satisfaction of the citizen today is based not least in the always plentifully available opportunity for drunkenness. In the factory one moist round of birthday drinks chases the next one. In the always present moonlighting, the fee is in bottle form. Car repairs, hospital beds, stays at spas and goods in short supply can be obtained only against high-proof beverages.

Sobering up the nation would require a government that is politically strong enough to cope with the displeasure of its subjects or economically so strong that it can offer incentives other than drink, such as a greater assortment of consumer goods, more discos for the young people, more cultural attractions for the older ones. But the Prague government is politically as well as economically weak. Therefore it has no other choice but to fill the vacuum in the social provisions normally available by products of the breweries.

Politburo member Bilak deserves understanding. The absurd sounding association beer equals bread is really the obvious thing to do here.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ROMANIAN JOURNAL REVIEWS DEVELOPMENT OF ALBANIAN AGRICULTURE

Bucharest REVISTA ECONOMICA in Romanian 29 Nov 85 p 28

[Article by Marilena Ivan, Institute of World Economics]

[Text] As early as in the first years after the country's liberation and the victory of the people's revolution -- 29 November 1944 -- Albania saw the move to implementing the agrarian reform, which represented one of the key measures of people's power in the stage involved. The development of the reform, in the context of the law adopted in 1945 by the National Liberation Antifascist Council, supplemented with a number of new provisions in 1946, led to the accomplishment of radical socioeconomic changes. The abolition of the class of big landowners (at the time of liberation 3 percent of the farms held 40 percent of arable areas), free land allotment to 70,000 families of poor peasants (45 percent of rural holdings) and provision of these families with livestock and agricultural implements created the premises for the subsequent development of the socialized sector, by the establishment of state agricultural enterprises and agricultural cooperatives.

Paralleling the building of the national industry, the development of Albanian agriculture during the period that followed liberation evinces the characteristics of gradual transition to the intensive stage. Moreover, the problems of development are tackled in an increasingly complex manner, with the efforts for the expansion of the technicomaterial base of agriculture being coupled, specifically in recent years, with measures to enhance the level of civilization in rural areas.

Under the specific conditions of relief in Albania, expansion of agricultural areas represented an essential factor for the whole development of agriculture. The investments made by the state and agricultural cooperatives for increasing the land resources, by completion of projects of clearing, soil improvement, terracing and building of drainage and irrigation systems brought about major results. In 1984, the cultivated area increased by a factor of 2.4 versus the level in 1938, and the irrigated area increased by a factor of 13.

Gradually as the possibilities for using additional areas for farming purposes are being exhausted, the emphasis has shifted to intensive utilization of existing areas, in both lowland and hilly areas. To this end, a special program for the development of agriculture during the 1981-1990 period has been put into application. In the first stage of implementation of the program, respectively under this five-year plan, important investment funds have been mobilized (about one-third of all planned investments) for the acceleration of the process of intensive development of agriculture. During the 1981-1984 period investments from state funds totalled about 2.18 billion leka, and those from production cooperatives, 2.5 billion leka.

The objectives of the programs for modernization of agriculture cover a very broad area of concerns: improvement of farmland, expansion of mechanization, better organization of plant and livestock production, application of results of scientific research, efforts for monitoring and increasing the economic efficiency of the activity in agriculture.

Among the above-mentioned matters, a major one involves conservation and enhancement of soil fertility. Despite the results obtained so far, there still are lands that are weakly fertile, acid, sandy, and the like, involving reserves in terms of increasing yields, provided the required improvement projects are completed at an accelerated rate and upon scientific bases. Conservation of the agricultural land supply is one of the priorities, because a tendency has been noted in terms of decrease in agricultural lands caused by erosion, landslides and unjustified withdrawal of some lands from agricultural use. As for ensuring, through irrigation and drainage projects, the moisture conditions, overall satisfactory solutions have been noted, however perfectible in light of the kind of crops.

The need for more rapid mechanization of agricultural operations stems primarily from the greater volume of work required by the increase in farm output. Under this five-year plan efforts have been made for better utlization of the existing fleet of machines, with measures also taken for introduction of new technical means.

In animal husbandry, the orientation toward intensive animal raising involves creation of the corresponding fodder base. Although positive results have been obtained, it is necessary to double or even treble the production of fodder crops and improve the structure in this cultivation. Creation of large animal husbandry complexes does not mean renunciation of use of natural pastures, whose utilization, however, also necessitates specific development projects.

Concentration and specialization of agricultural production by and large represents a significant orientation, assessed economically as advantageous and which involves both animal husbandry and vegetable crops. For instance, cotton growing is concentrated in only four districts, rice growing also in four districts (versus eight a few years ago), and tobacco growing, in 13 districts (versus 20 previously). The above-mentioned process permits greater specialization of farm brigades, that now handle two to three crops, versus six to seven in previous years. In animal husbandry production is specialized according to the various species, through establishment of individual complexes for cattle, hogs, fowls, and according to the various products, by creation within the complexes, of specialized sectors, for instance, in milk, meat, egg and other productions.

In the process of development and intensive activity in agriculture an input in increase is provided by research and education units, directly involved in the endeavors to improve the technicomaterial base and survey the long-range issues of the entire agricultural sector.

The improvement in the standard of living of the population in rural areas also is a facet of the strategy of socioeconomic development of the country, which is in close correlation with the current and long-range objectives of agricultural development.

A report given at the June 1985 session of the People's Assembly of the Socialist People's Republic of Albania provides a number of facts and figures regarding the results obtained and the objectives proposed for the second half of this decade in the area of supply of food and manufactured goods to the agricultural population and in the area of housing construction and provision of sociocultural amenities in rural areas.

The volume of sales to the rural population (who account for two-thirds of the total population) in terms of foodstuffs and nonfood products went up between 1980 and 1985 by about 20 percent in the case of state trade units and 13 percent in the case of cooperative units. Provisions for the 1986-1990 Five-Year Plan involve increases ranging between 14-40 percent in sales of basic foodstuffs and major categories of industrial consumer goods, with the goal of having supplies rise at a decidedly higher rate than that of the increase in agricultural population.

In the first 4 years of this five-year plan there were built 27,000 individual dwellings, and for the personnel in state agricultural enterprises 4,700 apartments were put up. Annually the state allots large sums in the form of long-term credits for housing construction, specifically in hilly areas. The appropriation of about 100 million leka during the 1981-1985 period for creches, nurseries, schools, rural clubs and cafeterias located in villages also is a major contribution to the improvement of the standard of living of the peasantry.

Results of consistent efforts on a long-term basis, the development and modernization of agriculture enable this basic sector of Albanian economy, alongside of industry, to increase its input into meeting the domestic needs for raw materials and processed goods, and also into the creation of the fund of products for export.

The traditional Romanian-Albanian friendship and cooperation relations have continuously developed in the years of people's power, on the basis of observance of the principles of national independence and sovereignty, equal rights, noninterference in domestic affairs, and mutual benefit. There has been an increase in economic cooperation under this five-year plan, mirrored in the expansion of annual trade exchanges and in conclusion of agreements for broadening and diversifying bilateral economic cooperation.

LACK OF COOPERATION REDUCES IRON-NICKEL ORE PRODUCTION

Tirana ZERI I POPULLIT in Albanian 7 Nov 85 p 2

[Article by Kostaq Duka: "For Lack of a Thread and Needle...."]

[Text] As a consequence of the lack of cooperation in solving certain problems which disturb the progress of production, ways are kept open for the loss of responsibility and the burdening of the economy with overspending.

Iron-nickel ore is produced in Korce, responsibility is sought in Pogradec

In the Rehove mine in Korce District a quantity of iron-nickel ore is produced for export. But the middleman on the way to Durres where the iron-nickel is unloaded is the Guri i Kuq mine in Pogradec. The mine did not get this middleman duty by chance. Inasmuch as the iron-nickel which comes from Korce District has great qualitative value, it is mixed with that of Guri i Kuq to improve its characteristics. Up to here there is nothing wrong. The bad thing deals with the responsibility. Inasmuch as it is up to the Guri i Kuq mine to play the role of middleman, it must also bear full responsibility for the production of export item, not only the amount produced here but also the amount which the Rehove mine of Korce District must ship out.

Therefore, the iron-nickel mine of Guri i Kuq accounts for the iron-nickel which is produced in Korce (and sometimes the export is not credited to the Rehove mine). "That is a fact," they say in the planning ministry, "that's the way it is done. For the export item, for the whole quantity which is sent to Durres, you are responsible...." "Why do you not supply the export item?" This question is posed emphatically in the economic activities of the Pogradec district. "But look, we have fulfilled our task, but those comrades of Korce have not sent their quantities." These explanations of the heads of the Guri i Kuq mine are repeated from meeting to meeting.

And it is good that this call for an accounting takes place, but they don't have the address precisely. We say they don't have it precisely because of the fact that principally responsible in many cases is the Rehove mine in Korce District. But it was unintentionally saved from great embarrassment for an export item which luckily it does not report as such because it has left the reports to the Guri i Kuq mine. The heads of this mine have gone to Korce several times, they have had discussions with the heads of the Rehove mine, with the participation of the workers of the two sections of the industry in the districts. They receive promises, but afterwards the trucks of the Korce auto park simply do not come. What happens? Korce District is among the districts noted for export. It has fulfilled and surpassed the tasks of this year. But how much would the non-realization of 1,584,000 leks foreign exchange burden the export plan of this district? This then is the value of the deficit which the Rehove mine has caused since the beginning of the year.

Is this deficit acknowledged in Korce district? It is acknowledged, but it is not treated with the strength which it would be treated with if it were valued as an export item, as it really is.

Therefore, we would have nothing bad, but only good if the Rehove mine would be responsible not only for the production plan and for the contracted tasks, but also for the export item.

For the Sake of Tradition

The workers of the sawmill are troubled, and with them, also, those of the packaging and production of chairs at the wood-processing enterprise in the district of Pogradec. They are not furnished periodically with lumber. Whose fault is it? Lumber is not lacking, it is produced in the sectors of the sawmills, but it waits at the railway station of Perrenjas. The transport is at fault, then. In following up this uneasiness of the workers we met with a practice like this. From the sectors of the sawmills in Uji i Ftohte and Bishnice, 25,000 cubic meters of lumber are sent to the wood-processing enterprises during the year. Of this amount 16,000 cubic meters pertain to the sawmill sector in Uji i Ftohte and only 9,000 to that of Bishnice. It happens like this. The 16,000 cubic meters from Uji i Ftohte are taken by automotive vehicles to the railway station of Perrenjas. The road from Uji i Ftohte to Perrenjas is 53 kilometers long, while there is another road which is 40 kilometers from Uji i Ftohte direct to the wood-processing enterprise. When you learn this, the question arises: Why not take the quantity produced in the Uji i Ftohte sector directly to the wood-processing enterprise, rather than travel over that road? Only for the sake of tradition? If the road is not suitable in the winter season, why not take advantage of it the rest of the year?

We have proposed this, they told us in the wood-processing enterprise. As far as we have heard the obstacles are presented by the Ministry of communications. A study we carried out shows that if not only the 16,000 cubic meters produced in Uji i Ftohte but also the 9,000 produced in Bishnice should all be transported directly with the motor pool vehicles, we would have an annual saving of 130,000 leks; at the points of loading and unloading ten fewer workers would work, and we would not have these delays. To take advantage of only 26 kilometers of railroad, the lumber is loaded and unloaded six times before reaching the wood-processing enterprise. Therefore, as the people way, "For lack of a thread and needle...."

SHORTCOMINGS IN EFFORTS TO IMPROVE QUALITY OF CHROME

Tirana ZERI I POPULLIT in Albanian 26 Oct 85 p 2

[Article by Sami Milloshi: "Labyrinth of Excuses"]

[Text] Few attempts to concretely solve the problem of the averaging of chromium. The problem of the averaging of chromium ore is neither new nor unfamiliar for the two mines, Batre and Bulqize. Some time ago the mines, each by itself (in their own yards) accomplished the averaging of ore with the purpose of raising the quality of the product for export. Now there has appeared on the agenda, besides the averaging within each mine, also the averaging of the ore of the two mines. It is understood, this is a solution which transcends the narrow interests of each enterprise, therefore it is a solution of a great problem to the benefit of our economy as a whole. This purpose is served also by the special decision of recent times, a decision which the Ministry of Industry and Mines and also the export organs presently have in their hands as the producers of the ore. Up to this point all is in order. But the question arises: What is being done of a concrete nature for the averaging of chromium ore, therefore how is it understood and what measures are taken in all the links in order that, as the saying is, the work will run like a clock?

Actually, not only does the work not run like a clock, but it is not understood yet why it should run like that, not to mention the responsibility which each one has that no one "mechanism" of this "clock" should become a hindrance. Why do we say this? Here is a fact. On the account of the Batre mine "Mineraleksport" holds 6,000 tons of ore, only because this mine has not fulfilled by 1.5 hundred [as published] the task resulting from the decision about the quality of the ore. At "Mineraleksport" it is justly said that this mine must by all means provide the required quality of ore for averaging with the ore of Belqize. While in the Directorate of Mines at the Ministry of Industry and Mines there is another claim according to which, and because in this or that instance the quality is not provided, still the averaging can take place. "It can take place!" Certainly it can take place, but exactly who must do this averaging? And what is more, where? And for these questions you get quite a different answer both in the Ministry of Industry and Mines, also in "Mineraleksport."

"If it comes to us in our yards below the required quality, we do not do averaging nor is it up to us to do it," the director of "Mineraleskport" Niqifor Alikaj tells us. "Cranes cannot be used for small amounts of ore, but electric energy. Yes...." he continues.

Whereas in the Directorate of Mines at the Ministry of Industry and Mines, the director Frank Kroqi speaks to you with another language. "The enterprises of Foreign Trade do not agree that our men participate in evaluating the quality of chromium. They do not agree that a mixture be made of the Batre chromium with that of Bulqize, justifying this with the inaccurate analyses obtained from the material in the towers, etc., etc."

Who is right? What must be corrected so that this dropping of the relay-race baton of responsibility does not continue as much by the one as by the other? Naturally it is not so easy to make this or that organism guilty, but one thing is clearly understood. The fault remains an orphan because of narrow interests (from the producer on down to the others, so that each one comes out clean on his own account). They do not keep in mind what value, what effectiveness the implementation of the decision taken on the averaging of ore really has. When we say that narrow interests hinder, displays of ministerial bureaucracy, how do you say it, with this we have in mind that, though as we brought out, there are misunderstandings about solving concretely this or that problem, again listen to Niqifor Alikaj saying, "Nobody has come to us (Mineraleksport), to discuss what we are to do." Or, "You finish the regulation (the petition of "Mineraleksport" to the Ministry of Industry and Mines), afterwards let us talk." And as long as the problem remains unsolved, complaints about one another continue so much from one telephone to the other. Telephone consultations continue. "Why do you not mix the chromium in Lucan, but...." and "...listen, Sokol, (request to the director of the Directorate of Mines of the Ministry of Industry for Sokol Kabon, deputy director of "Mineraleksport"), tell Halik Hoxha that he is hindering us...." But in addition to these reciprocal admonitions by telephone, hope is not lacking. "But why, man, we are working for the one goal."

Nor is there a lack of the accounts which Franco Korqi keeps, according to which if work were done like this or like that, the economic effectiveness would be tens of thousands of leks foreign exchange, etc., etc. But who needs the slogans about the economic effectiveness of the averaging of ore, who needs these accounts, when in fact the matter has not been discussed openly by all the parties (beginning with the producer) in order to solve concretely with a creative spirit each misunderstanding there in the place where the averaging will be done. Those slogans, those complaints about one another on the telephone, as long as they leave the problem pending unsolved, are nothing other than bureaucratic procrastination harmful to the interests of the economy. If it is said, "But why man, we are working for the one goal," this must result in concrete efforts to resolve such problems. Who will do the averaging in the yard (wherever that is decided), the enterprises of the Ministry of Industry and Mines or

"Mineraleksport" (the discussion is always about occasions when the ore does not come up to the specified quality). Another question: Exactly how do we proceed in the averaging of the ore in the yard? All these problems are fully capable of being solved, if the producers and the directorates of the respective ministries would only discuss matters openly, and each retain full responsibility for whatever he must solve on the basis of the decision. And let all the basic organizations of the Party barricade themselves against the concepts and practices which nourish the narrow interests of the sector or the ministry, which only thrust the problem into the labyrinth of excuses.

ELECTRICAL ENGINEERING INVESTMENT POLICY VIEWED

Prague PLANOVANE HOSPODARSTVI in Czech No 7, 1985 pp 70-76

[Article by Eng Elena Korenova, State Planning Commission: "Investment Policy in the Electrical Engineering Industry"]

[Text] Management of the electrical engineering industry department uses as a starting point the tasks and needs of its production, trade, and research structure corresponding to the requirements of the national economy and the development of socialist economic integration. Activities in the field of producing basic resources are also derived from this.

In application of investment policy, the department starts from the principles of the "Set of Measures To Improve Management of the Economy After 1980" and carries out the tasks laid out in "Main Directions for Economic and Social Development of the CSSR in the Years 1981-1985" approved at the 16th CPCZ Congress and the conclusions of the 10th CPCZ Central Committee Plenum on the tasks and development of engineering, electrical engineering, and the metallurgical industry after the 16th CPCZ Congress. The department directs the economic production units and subordinate enterprises to higher efficiency for the resources expended for capital construction, to more rapid returns on investments, to utilization of the results of science and technology, and to an orientation toward progressive modernization, rapid payback actions, and reconstruction.

The plan for capital construction for the Seventh 5-Year Plan created for the electrical engineering industry the conditions and space to ensure a more rapid rate of development and an improved make-up in accordance with the needs of the national economy and global trends. Despite the new conditions in the national economy at the beginning of the 1980's, twice as many investment resources were left to the department by law in the Seventh 5-Year Plan, with a production growth rate established at 36 to 42 percent, as were invested in the limited economic production units and organizations in the previous 5-year plan. A significant increase in the volume of work and deliveries created a favorable basis for gradually carrying out the designated tasks and for preparing for its further development in the next 5-year plan as well.

The orientation of the investments comes from the principles of intensive development in the production process, while respecting distributed investment actions and essential structural changes in the department's production base which are required by rapidly growing production. One must keep in mind that the electrical engineering industry department's production base was marked by an inadequate level of investment in the electronics fields in the fourth through sixth 5-Year Plans. It now has a large number of broken-down facilities and others which are not suitable for its needs and the tasks which are placed on the department.

Distribution of investments in the Seventh 5-Year Plan pursued the following intensification factors of the production process:

--the previously approved concept for the development of fields in the electrical engineering industry will be brought into accordance with the needs of the newly created department and of the national economy;

--the structural transformation of the production base will take place mainly through rebuilding and modernization and these forms of construction will take preference over new construction;

--the technical level and quality of the production base will be upgraded by application of R&D results and the purchase of licenses;

--the allocation of new developmental plans will be oriented toward areas with favorable developments in the labor force availability and increased attention will be paid to modernization and rebuilding to achieve maximum savings and better utilization of the labor force;

--particular attention will be paid to transforming the department's production base on the territory of the capital city of Prague;

--the development of the electrical engineering industry will be totally subordinated to the need for a definite strengthening of its anti-import and export capabilities;

--demands for importing machinery and equipment from nonsocialist countries will be minimized; the limits of DNU [hard currency credits] will be used first of all for specifically designated construction projects and those which provide exports to the USSR:

--imports of construction labor or construction professionals will not come into consideration;

--the use of steel construction designs will be reduced;

--greater efficiency will be achieved in investments; that is, there will be greater benefit from the products used and rationalization of fuel, energy, and raw materials consumption; better utilization will be made of the existing fixed assets and working more than one shift will be increased;

--the largest investment actions of the Seventh 5-Year Plan will be reevaluated from the viewpoint of their capital intensive nature, marketing secured, and demands for importing materials from nonsocialist countries and improving the efficiency (specifically this concerned a group of construction projects for the production of color picture tubes at the kraj enterprise Roznov Tesla for Kcs 1.4 billion and a group of construction projects for the production of asynchronous motors by MEZ in Mohelnice and Michalovce for Kcs 3.6 billion).

To implement the investment policy according to specific principles and tasks, the volume of work and deliveries was distributed into individual categories of investment construction in the following proportions: 31.4 percent of the construction work was designated for the development of buildings and construction projects. The volumes of construction work were derived from the intention of reducing the degree to which facilities are scattered, completing construction projects within the planned schedules, and with the construction projects already begun achieving savings in the first years at a level of about 10 percent of the overall budgeted expenses; 68.5 percent of the volume of work and deliveries was designated for the development of technology and machinery equipment and 49.5 percent for construction projects with budgeted costs over Kcs 2 million and 50.5 percent for construction projects with budgeted expenses up to Kcs 2 million, including machinery and equipment not included in the budget for the construction project. The limit on budgeted expenses [BE] for beginning new construction projects for the electrical engineering industry ensured significant development for the department.

Investments for construction projects with BE over Kcs 2 million were designated in particular to implement plans for the production of asynchronous motors, color television picture tubes, the development of electronics, automated control systems for technological processes, industrial robots and manipulators, medical equipment, tractor engines, and other construction projects.

The amount of the limit for construction projects with budgeted expenses up to Kcs 2 million, including machinery and equipment not included in the construction project budget, was established to ensure the importation of machinery and equipment for acquisition of computer equipment and machine tools and shaping tools to balance accounts; for measures providing savings in fuel, energy, and metals; for progressive modernization in the FMEP [Federal Ministry of the Electrical Engineering Industry] enterprises on the territory of the capital city of Prague and nuclear programs; and for the reconstruction and modernization of complete production sectors and working areas.

Under this distribution arrangement, 45 percent of the volume was directed at progressive modernization and actions with a quick payback. A 15 percent limit was set on technological equipment for the main production fields. This involves electrical sources of power and light, components for electronics, semiconductors and design elements, composite microelectronic elements, vacuum equipment, consumable electronics, measuring instruments, medical equipment, machinery for information processing, and automation and regulation instruments.

The limit of covering imports of machinery and equipment from nonsocialist countries without hard currency credits was determined for the most important investment actions supporting the production of color television picture tubes, integrated circuits, communications cables, area communications, asynchronous motors, electronic lithography, hybrid integrated circuits, distributors, robots and manipulators, plastic materials, and special equipment.

The capital construction plan also includes tasks arising from providing for three state target programs which include electronics, high-voltage distributors, and technical means for ACS [automated control systems] for technological processes of production and nonproduction activities. In addition, tasks were worked out by which the department will help to ensure the implementation of other state target programs [nuclear energy, savings in fuel and energy, and rationalization of the consumption of metals].

In the Seventh 5-Year Plan, a start was also made in deciding on and preparing the capacity required to support future departmental tasks connected with the predicted needs and development of the national economy in the Eighth 5-Year Plan and beyond. A primary need was shown to be accelerated modernization of the technological base of the department with a minimal orientation to imports for nonsocialist countries. This will involve the construction of capacity for the production of single-purpose, unique machinery within the department which in their parameters and quality will replace their importation from nonsocialist countries and save hard currency resources for the national economy. The growing quality demands on the component base for electronics and other assembly productions of the electrical engineering industry have required investments to resolve the existing electrical plant and to rebuild it for modern operations with technology corresponding to the high level of demands for quality of the components to ensure the reliability of the final products both in the electrical engineering industry and in other production departments and the organization of the entire national economy. Furthermore, preparation of investment actions has begun for constructing capacity for the production of detector instruments, regulators, and the component base.

The volume of investments in the Seventh 5-Year Plan was derived from balancing the capacity capabilities of the national economy for construction work and ensuring deliveries of technological equipment both domestically and by imports. Even though their level in comparison with the previous 5-year plans means a certain break and a jump in favor of the development of electrical engineering and electronics in the CSSR, it was not possible to meet a number of demands to support state target programs and in the capacity for production of tow cables and insulated conductors for surface coal mining, electrical furnaces, nuclear energy, motorized trains for the USSR, and others. These problems will have to be solved in the next 5-year plan.

A list of the basic tasks in the sector of capital construction which the department of electrical engineering industry is performing in the Seventh 5-Year Plan forms the basis of the annual operational plans for FMEP capital construction and its economic production units, including directly managed organizations, as well. It shows the difficulty and complexity of ensuring the proper proportions in the investment process. A number of measures were taken to carry out the tasks, which in the majority of cases effectively are helping to fulfill the decisive investment actions.

The results which the department has achieved since it was established [1 Jan 1980] show that it has made use of its given opportunities, especially in the economic and managerial fields. At the present time it is providing the greatest growth rate in production within the engineering branch, due to no small degree to the investment policy.

The process of investment planning in the department of electrical engineering industry takes place according to the uniform planning methodology and the regulations on methods-administration and legislative control of the investment process. The volume indicators of capital construction and specific lists of construction projects of a nature of important tasks, centralized construction projects, and other construction projects was worked out by the department for the subordinate VHJ's [economic production units] and directly managed organizations. It established execution of the tasks of the capital construction plan by designating the level of the amount of labor and deliveries for construction projects with budgeted expenses over Kcs 2 million as the minimum for the VHJ's and the limit for construction projects with budgeted expenses up to Kcs 2 million, including machinery and equipment not included in the budget for the construction project [SZNR] as the maximum. In the category of investments with BE's over Kcs 2 million, it was decided that 22 construction projects of the nature of centralized and important tasks should be completed in the Seventh 5-Year Plan. Of these, more than half [12] were designated for execution in the BHJ kraj enterprise High-Voltage Electrical Engineering Plants.

Fulfillment of the capital construction plan in the FMEP is complex. It takes place under conditions of organizational building of our own design organization and expert invetment units and stabilization of professional personnel in those sectors, which is accompanied with certain disrupting problems. The fundamental tasks are supported by a number of actions in addition to those of a planning, standardization, and legislative form. It thus pursues fulfillment of the tasks within the established schedule, especially in the case of putting capacity of an important nature into test operation and completing construction projects while achieving the design parameters. In this manner, management has achieved positive results in building a group of projects for the production of color television picture tubes. The department is continuously better utilizing its fixed assets and rujning more than one shift, as well as increasing the single-purpose machinery technological equipment by building up the production capacity by our own capital construction.

With the effective help of the SK VTRI [State Commission for R&D and Investment Planning], SPK [State Planning Commission], CPK [Czech Planning Commission], SIPK [as published], SBCS [State Bank of Czechoslovakia], and other central agencies, the department is succeeding in dealing with even the serious problems of the supplier systems, and investment, financial and hard currency coverage of construction projects.

On the b[illegible] the results achieved in the sector of capital construction in the [illegible] to 1984, one can predict that the FAEP will fulfill the Seventh [illegible]ar Plan. From the viewpoint of the economic results achieved as a whole, one can evaluate the expended investments as effective. Since its formation, the department has shown the greatest growth rate of production within the engineering branches [7 to 10 percent], while systematically ensuring the growth in profitability of production assets and a reduction in the material and energy inputs per Kcs 1 of output. In evaluating the efficiency of investments in the department of the electrical engineering industry, one must start with its role within the national economy as the bearer of and pioneer in new equipment in production, especially assemblies.

Up to this point, the FMEP still suffers from inadequacies in the investment process in the predesign and design preparation of construction projects, both in the timely processing of documentation and the economic justification and evaluation of the actions proposed, as well as in relation to the utilization of existing fixed assets. The degree to which more than one shift is worked is still not satisfactory and likewise getting rid of obsolete fixed assets and application of R&D results to the production process are both proceeding at a slow rate of speed. Carrying out investments is still affected negatively by insufficient clarity in the production concept and difficulties in concentrating capacity to implement the investment actions, which results in disproportionate extensions of the construction schedules and increases in scattering of facilities.

In accordance with implementation of the "Set of Measures to Improve Management of the Economy," it is necessary to increase demands for preparation and inclusion of construction projects in the plan in the FMEP. In doing so, it is essential to give preference to implementing the plan for technical development by modernization and rebuilding of existing facilities and savings in labor, fuel, energy, and metals and better utilization of the principles of exchangability among existing capacity to achieve full two-shift operations on highly automated and high-output machinery while continuing to push for three-shift utilization of especially high-performance and expensive imported machinery. In expanding modern products, it is necessary to pursue the corresponding surpression of and doing away with products with no future.

The FMEP's capital construction plan for this year and the directives for preparation of the plan for the first year of the Eighth 5-Year Plan are derived from fulfilling an updated plan for 1984, clarification of the plan of the Seventh 5-Year Plan, and the conclusions of the 10th Plenum of the CPCZ Central Committee. It supports maintaining the high rate of development of the electrical engineering industry even after 1985. The new methodology in planning investments has been applied to it, which provides for the division of the total amounts of labor and supplies into the amount of SZNR [machinery and equipment not included in the construction project budget] and the amount for the construction project as a whole [that is, for construction projects with BE's over Kcs 2 million and up to Kcs 2 million].

The composition of investments for 1985 pursues in particular support of the departmental tasks connected with state target programs, as well as rebuilding, modernization, and rationalization of the existing departmental production base, application of the results of the state R&D plan, introduction of computer equipment, and renewal of machinery and operational assemblies. These goal-oriented investments will primarily support renewal and development of the production base of the main groupings of production fields of the electrical engineering industry where one finds:

1. High-voltage electrical engineering;
2. The components base;
3. Investment electronics;
4. Consumer electronics;
5. Measuring, scientific, and laboratory instruments;
6. Computer, measuring, and regulatory equipment.

The amounts of investment for construction are derived from negotiations of supplier-customer relations for 1985, when eight construction projects are supposed to be finished. These concern capacity for the production of component bases and printed connectors in Prelouce and Roznov, measuring and regulator equipment in Trutnov, robots and manipulators in Presov, asynchronous motors in Mohelnice and Michalovce, and intermediate drives in Brno. The department has charged all general managers of the appropriate VHJ's to complete their construction projects within the established time schedules. In order to make better use of the fixed assets and multiple shifts, the department established a goal for 1985 of achieving an average of 82 percent utilization of machine work areas, which is five points higher than the level actually achieved last year. This goal is to be reached by more emphasis on getting rid of obsolete fixed assets, reconstruction and modernization, concentrating machines into technological assembly lines, and other measures.

The investment policy in the department of electrical engineering industry strives to effect significant structural changes, especially in supporting proposals by VHJ's for development and modernization of capacity for electronics and microelectronics which are the basis for automation in industry, transportation, communications, agriculture, and other areas of the national economy. It is accelerating the development of production capacity by exploiting R&D potential and cooperation with the socialist countries. Investment resources for machinery and equipment not included in the budget for construction projects are oriented mainly at ensuring increased production in the Seventh 5-Year Plan by 40 to 50 percent. Priority development of electronics and especially microelectronics helps to increase the use value of the products and improve the technology in decisive branches and fields of the national economy [FMPE - Federal Ministry of Fuels and Energy, FMHTS - Federal Ministry of Metallurgy and Heavy Engineering, FMVS - Federal Ministry of General Engineering, FMEP - Federal Ministry of Electrical Engineering Industry, FMD - Federal Ministry of Transportation, FMSp - Federal Ministry of Communications, MP CSR and SSR - Czech and Slovak Ministries of Industry, MZVz CSR and SSR - Czech and Slovak Ministries of Agriculture and Food, and MSt CSR and SSR - Czech and Slovak Ministries of Construction]. It thus helps to speed up the growth in the productivity of labor and lower material demands. It develops the effort to increase the export capabilities of engineering and other products in order to limit the demands for their importation. So far, however, this task has not been fulfilled to the extent necessary.

International division of labor within the socialist economic integration is still insufficient in the investment sector. It is essential to bring about conditions in cooperation with the VHJ's for implementing higher forms of cooperation, especially with the Soviet Union.

Through actions and concentration of investment resources, the FMEP along with the VHJ's is pursuing:

--securing a future tripling in the growth of production of component bases, electrical engineering, electronics, optical electronics, and in particular microelectronics;
--mastering and expanding the production of bipolar and monopolar integrated circuits and microprocessors by utilizing modern technological equipment, including electronic lithography [ELG Brno];
--creating conditions for the introduction of automated control systems, especially in the field of machine tools, shaping tools, and textile machinery.

In automation equipment, production is being developed of detectors [Trinec], detection instruments, servodrives, signalling elements, and equipment for measuring temperature, as well as the production of control, regulatory, measuring, and monitoring equipment for nuclear energy and measuring, testing, laboratory, and medical equipment. THE FMEP also takes care of deliveries of modern computer systems with the necessary peripheral equipment and programs, especially for control of technological processes. The production of electronic calculators and telecommunications equipment is being developed in accordance with the CEMA countries' uniform systems.

In the field of high-voltage electrical engineering, the FMEP is working to fulfill deliveries for capital construction in particular for the nuclear and fuel and energy program and the production of modern drives for engineering. To support the domestic market, investments are designated for expanding innovative products of consumer electrical engineering, especially color televisions, tape recorders, record players, radios, and other products.

In connection with the current status of the living and work environments and the need for improving and protecting them, the investment plan includes items for ecological construction projects and for a social program.

In addition to the above tasks, the investment sector is also dealing with problems connected with the creation of the "Elektromont" state economic organization, which is supposed to contribute to rational savings and a strengthening of the external assembly capacity of the department of electrical engineering industry.

In the "Basic Directions for Economic and Social Development in the CSSR for the Years 1986 to 1990" and the projection to 1995, production increases are foreseen in the Eighth 5-Year Plan of 63.2 percent and in the Ninth 5-Year Plan of 78.9 percent. The favored fields are development of electronic component bases, single-purpose machines, robots and manipulators while the growth rate will slow down in those fields which require a lot of material, particularly high-voltage electrical engineering.

Distribution of investments and their orientation in the Eighth 5-Year Plan and beyond is based on priority support of the progressive lines of development of the national economy by ensuring use of R&D outputs, target programs, savings in fuel and energy, the export and anti-import concept, and effective modernization of capacity. At the same time, it should achieve a high level of production and products of the electrical engineering industry comparable with the global standards.

The concept of basic investments starts with the capacity calculations and a demanding evaluation from the standpoint of economic efficiency. According to analyses of the efficiency indicators of the individual construction projects proposed for starting in the first half of the Eighth 5-Year Plan, the results for the FMEP are favorable.

A list of construction projects of important and centrally considered nature for preparation in the first years of the Eighty 5-Year Plan for the purpose of timely investor and design preparations, as well as providing the capacity needed in construction labor and technology, was passed to the design and supply organizations and will be further specified. One third of the budgeted expenses for construction projects planned to begin in 1986 is in support of development of the production capacity of state target programs and the rest is for expansion of capacity to improve the quality of production and products of the electrical engineering industry, problems connected with socialist economic integration, the production of single-purpose machines, and application of the results of R&D. Currently intensive work is being done on the concept of continuing rebuilding and modernization of the production base of the department and FMEP enterprises on the territory of the capital cities of Prague and Bratislava, as well as selection of investment actions prepared for starting in the second half of the Eighth 5-Year Plan.

In working out the plan of the Eighth 5-Year Plan in the sector of production of basic resources, it will be a matter of reevaluating the efficiency of utilizing existing fixed assets and the economic contribution of the proposed investments in relationship to the indicators of effectiveness established for evaluating investments. On the basis of the calculated contributions of the individual investment actions and a judgment of the social economic efficiency of the construction projects, an order of importance will be established for their planning and implementation in the next 5-year plan.

Carrying out the demanding tasks of the electrical engineering industry in the capital construction sector in the next 5-year plan and for the long term requires creating the appropriate conditions and prerequisites in the department, with which constructive aid by the other central agencies and departments, especially suppliers, should associate themselves. One must bear in mind that reaching the strategic goal of our economic policy, the electronization of the national economy, depends on mutual, dedicated, and responsible cooperation by everyone.

EFFECTS OF 4TH, 5TH GENERATION COMPUTERS ON FOREIGN TRADE

Prague ZAHRANICNI OBCHOD in Czech No 9, 1985 pp 3-6

[Article by Bohuslav Vavra: "The Increasing Effectiveness of Internal Economic Relationships Resulting from the Use of Computer Technology (4th and 5th Generation Computers in Foreign Trade Organizations)"]

[Text] The development of electronics gradually reaches all spheres of the national economy, and thus has a direct impact on the competitiveness of many of our products in terms of quality and cost. In addition to the use of microelectronic components in the production process and in products themselves, there is nothing to prevent the applications of existing computer technology from becoming an integral part of the control process.

Computer technology resulting from microelectronic components is causing qualitative changes as the result of quantitative increases in capacities and of the ability to process much more complex tasks and achieve results within an acceptable or possibly necessary time limit. The speed with which many complex tasks may be solved makes it possible to use the new computer technology not only for the control of partial production processes, but for entire production and organization complexes as well. The technology's relatively low cost makes it possible to use it at many work centers and thereby help solve the dilemma of chosing between centralized and decentralized computer technology, a choice previously affected by high investment or operational costs. The centralization or decentralization dilemma remains as regards the acceptable structural complexity of both the system controlled and the system doing the controlling.

In foreign trade organizations (OZOs), the use of microelectronics can be found in the following circles and areas:

a. Organizational structure of OZOs

a1. Current organizational structure of OZOs

a2. Use of computer technology, 1981-1985

a3. Preparation of new organizational structures

B. Course of a commercial operation

b1. Preparation of a commercial operation

b2. Administrative processing of a commercial operation

b3. Evaluation and generalization of the effects of a commercial operation as regards other controls on enterprise trade policy

c. Elements of artificial intelligence in the control of OZOs and commercial operations

c1. Strengthening of identification abilities

c2. Strengthening of memory capacities

c3. Strengthening of logical evaluation abilities

c4. Strengthening of higher intelligence

d. Covering the information needs of OZOs

d1. Methodical approaches

d2. Research needs and verification of applications for the introduction of new computer technology for the control of OZOs

d3. Robotization in the administrative work and control of OZOs

Foreign trade organizations(OZOs) are a social and dynamic system in which the main driving force is people. Computer technology can influence the structure of a foreign trade organization itself, or affect an individual in such an organization, or also, by the so-called generation effect, influence the entire human population and affect enterprise structures in retrospect.

With a suitable utilization of computer technology and correct theoretical preparation, realistic changes can be made in organizational structures in the next 2 to 3 years. In contrast, altering the opinions of employees and encouraging them better to utilize the existing capabilities of computer technology would require more than the period of a single five-year plan. Therefore, in the further development of computer technology applications, we must deal not only with the development of the technology itself, but also with the psychological growth of the parties involved. The rapidity with which we will make maximum use of computer technology depends on the social consciousness of foreigh trade employees.

Computer technology will be applied throughout the foreign trade process, from forecasting to planning, the preparation of commercial operations, and replacements of routine administrative and many other mangement tasks. We will have to come to terms with the idea of robotization in administration as well as in managerial work because the majority of activities can be done algorithmically and are therefore fully replaceable by machines.

a. The Organizational Structure of Foreign Trade Organizations

al. Present Organizational Structure of OZOs

The organizational structure of large and medium-sized foreign trade organizations was determined in the late 1970s. One of the main influential aspects was the fact that these organizations in themselves represent the intermediate management link. They are managed by a director-general and have the following sections, managed by deputy directors-general or directors:

1. Trade section
2. Commercial policy and integration section
3. Economic section
4. Cadre and personnel section
5. Organization and automation section
6. Units under the direct supervision of the director-general

1. The trade section is managed by the deputy director-general, and in larger enterprises or sometimes in enterprises located in both of Czechoslovak states, will have a number of trade sections and a corresponding number of trade deputies. The trade section is divided into trade groups managed by trade directors. The size of the trade group depends on the commodity traded and the area of responsibility, and usually has 30 to 70 employees. The trade group is further divided into trade subgroups by commodity and area of responsibility. A trade subgroup usually has 5 to 12 employees. In large trade groups dealing with technical services problems, departments may be formed. In addition to a trade subgroup, a trade group often has an economic subgroup for some specialized services. There are many exceptions to the numbers of employees as well as to the structure. Transportation is covered by the trade section.

2. The commercial policy and integration section is divided into subject areas and is managed by the section director. The subject areas may be divided into subgroups. In addition to the area indicated by the section's title, it is responsible for scientific and technical information and for the technical development of the commodities processed by a given foreign trade organization.

3. The economic section is managed by the economic deputy director-general and is usually the largest in each foreign trade organization in terms of the number of employees and is structurally the most demanding, because it processses the plan, prices, foreign currency matters, salaries, statistics, accounting, financial policies and building management. It is divided into subject areas and further into subgroups, rarely with an intermediate department.

4. The cadre and personnel section is managed by the section director and is divided into personnel, cadre, and cadre education areas. In the case of large enterprises, it will reach up to 20 employees.

5. The organization and automation section is managed by a section director and is divided into three subject areas: computer center, programming and analysis, and organization and management techniques. Fifteen years ago, the management of this section influenced very positively the development of the utilization of computer technology in many foreign trade organizations. Unfortunately, in about 25 percent of enterprises, the functions of the section director and certain other positions were utilized to make personnel transfers within enterprises and cadre transfers between the foreign trade network and the enterprises.

6. Units directly supervised by the director-general--except for the secretariat of the director-general--are small subject areas such as the legal area, special tasks and defense, enterprise monitoring or individual work centers, such as fire control technologists.

The current organizational structure of foreign trade enterprises poses no obstacle to further development of the use of computer technology. On the contrary, the personnel composition of this structure significantly influences the speed of development in the period ahead, and it cannot be considered to be satisfactory. Not until during the preparation and aplication of the 5th generation computers can there be qualitative changes in organizational structure, including personnel strengthening.

a2. Use of Computer Technology in 1981-1985

In the 1981-1985 period, computer technology changed in approximately a fourth of the enterprises, while in a third the existing operational technology was strengthened. As a result, the problems in these enterprise groups are qualitatively diferent. In those enterprises where there was no change in technology, there is the risk that the management system being processed will be put out of commission, which would result in losses in the commercial area which are possible but difficult to define. Almost all enterprises have capacity problems to deal with. The upgrading of computer technology, and thus its new capabilities, made a broader use of the technology; therefore, these enterprises have also not satisfied the capacity demands. The capacities lacking are mainly interactive data processing or perhaps the individual utilization of a computer in the decision making process.

The extent of the upgrading of computer technology at the foreign trade enterprises indicates the length of time that current technology can be used, which in itself is a warning signal as regards further development of computer use. Computer technology that is over 5 years old is at best half as effective, and significantly affects the qualitative parameters of processing as well.

In the period under review, there was development of the production of a new group of computers, the so-called personal computers. These computers were practically not introduced in the foreign trade organizations, for which reason this entire area contributes to the passive application of computer technology in OZOs. Unquestionably, personal computers bring computer technology closer to the employees or to specialized work centers. At the same time, these computers contribute to changes in the psychological position of persons toward computer systems. Changes in the methodology of analysis, the utilization of programming languages as well as the extension of operational research methods into realistic decision-making are the side effects of the use of personal computers. So far, foreign trade organizations have not had to deal with these influences.

The miniaturization of computer technology in the mid-1970s made it possible to attain large computer capacities in a small space, but in this case the practical production overtook the long-term prognosis. Very soon after the industrial manufacture of large computer systems, the present parts base was used for the manufacture of table and later pocket calculators. The parts base was miniaturized so the dimensions of simple calculators became smaller and at the same time the capabilities were increasing. The miniaturization of external dimensions of the calculator stopped after it became possible to use a pencil point on the keyboard. Functional capabilities are not limited, and on the contrary are ever increasing. It seemed that gradually enhancing and improving the functions of these calculators would lead to the creation of personal computers. Miniaturization occurred much faster, and it is now apparent that the personal computer is not the continuation of developments as regards calculators, but instead a total decrease in the size of the original large computer systems. The personal computer with a 1/2 MB internal memory and 10-20 MB external storage exceeds the capacity of the large computers, which in Czechoslovakia are still being used frequently. Not only the corresponding capabilities but unfortunately the qualification and time demands for preparing effective utilization approach those of earlier large computers.

In the period under review, there was no decrease in the qualification or capacity demands of preparing for the effective utilization of computer technology, and it may be assumed that not even the other 5th generation computers will decrease the factual demands of preparing for the use of a more effective technology. The notion that a speaking compute, capable of reacting to spoken commands, will enable everyone to build computer information systems, is absurd. A speaking computer will solve concrete tasks easily and quickly only so long as the person issuing the commands is capable of correctly formulating his requests. The computer will replace routine physical tasks associated with transferring information as well as some basic thought operations, and therefore the human brain will be used at a higher level.

a3. Preparation of New Organizational Structures

Any kind of batch data processing with a 24-hour cycle or just a several hour cycle makes it impossible to include this activity serially in the routine administrative decision-making process. The automated control system of the OZO" is run this way on almost all computers in the sector. This is known as "parallel" processing because the data processing is being carried out independently, "alongside" the routine operation of the foreign trade organization. Only at some points is there a connection or crossing of these two systems. The effort to use serial processing under these conditions often leads to a waste of work forces.

Only interactive data processing, i.e., "instant" realization of the majority of the operations on the computer when man is operating the machine, makes it possible to include computer processing in series with other work activities, which is how the data processing merges in terms of time with the other activities of the employees of the foreign trade organization.

A qualitative change in the structure of data processing will necessarily lead to qualitative changes in the structure of management and therefore to changes in the organizational structure of the foreign trade organization. The future development of these structures may be considered as a variant, and it is possible that in certain enterprises, depending on the commodity, the areas being processed and the type of personnel, these structures will be even further differentiated.

The onset of interactive processing will be reflected in changes in the type of work, and in some cases even in disbanding some work centers and combining units. In the course of these qualitative shifts, work productivity increases by tens of percent and, in individual cases, there is an occurrence of a total elimination of previous "human" activities. In cases where the number of employees required division of a unit, there will be a remerger of it without a qualitative change of structure.

Further changes in the organizational structures of an enterprise will be necessitated not only by changes in data processing but also qualitatively, with another stage of management resulting from the utilization of the methods and functions of new computer technology and methods of data exchange between enterprises at the domestic as well as international levels. Of course, a new way of processing many trade procedures will occur, which will influence the existence of a number of work centers.

The preparation of new organizational structures, including the checking of personal computers and other new functions of computer technology, will have to become a part of a specialized work center in the foreign trade sector, either in a research institute or at the Mechanization Center for Foreign Trade, or possibly at a specialized foreign trade organization.

b. The Course of a Commercial Operation

b1. Preparation of a Commercial Operation

The utilization of computers in preparing actual commercial operations at the majority of foreign trade organizations is not at all widespread. This commercial area called for larger technological capacity and more extensive analysis that have been available up to now.

The production of personal computers with a sufficiently large internal memories and the possibilities of having these computers communicate with a central system fulfilled the first condition for the utilization of computer technology in preparing commercial operations. Furthermore, the trade reporter must have access to a number of ancillary facts and information, including information about the course of previous commercial operations of a similar type in a same or otherwise comparable territory. Furthermore, he will need to know transportation tariffs and other seasonal information, and in particular know a series of suitable programs for processing various data on the commercial operation. After chosing the variant, all important information should be in the centralized memory and selected data should be transferred automatically to the enterprise control system.

The necessary projection and program capacities are still an obstacle to introducing computers into the preparation of commercial operations, because the preparation of a commercial operation in individual commodities and territories may vary so greatly that it cannot very well be covered by a central method, even within the context of one enterprise. Only some segments of programs and some procedures can be the same for more than one commodity. We will return to this problem when we discuss the approach to further development.

b2. The Administrative Processing of a Commercial Operation

The problem of administrative processing of a commercial operation can be divided into export and import, possibly broken down regionally into the socialist and nonsocialist areas.

In the export area, a detailed study was completed about individual operations of the entire commercial operation, including documentation of all forms and regulations associated with carrying out the commercial operation. The number of operations reaches almost 770. Of these, at least two-thirds can be further influenced by using computer technology. The study was put together by a volunteer team of employees of several foreign trade organizations lead by Eng. V. David, RUOA a.s. [joint stock company] Chemapol. Putting this entire task into modular programs and gradually introducing it to foreign trade organizations is beyond the purview of that team, and further continuation of the task at a professional level has so far not been arranged.

The area of imports has generally not been researched. The recent effort to rearrange import activities under the umbrella of a foreign trade organization, Koospol, a joint stock company which would include other foreign trade organizations, took a heavy beating in the first round, and when the second round began the only cooperating company that remained was PZO (foreign trade enterprise) Kovo. Simultaneously, the principle of cooperation of the machine tool industry and nonmachine tool industry enterprises proved very difficult. Finally, the project was finished by Koospol itself, which promised to use it at PZO Kovo.

It has been known for a least ten years that individual foreign trade organizations cannot alone handle the complex processing of commercial operations. However, all the efforts toward further cooperation are failing to yield the necessary results. The cooperation problem must be solved methodically as well as organizationally, including elaborating on the material and moral stimulus for all participants.

b3. Evaluation, Generalization of Effects of the Commercial Operation for Further Management of Enterprise Trade Policy

The final calculation of each individual commercial operation, and its summarization by smaller or bigger territories, or by individual commodities or groups of commodities according to the organizational structure of the enterprise, are one of the realistic outputs in a number of foreign trade enterprises. Even though it is one of the most difficult applications of the existing automated data processing, one which demands complicated and often multistep storage and processing of enterprise data, most enterprises make very little use of these calculations. When this application was not available, everyone agreed that it was quite necessary. Then interest quickly waned. Even though in some cases this may be explained by the poor quality of data, we do not think this is the main reason. We assume that data which are demanding in this way need to be part of a qualitatively higher stage of output. The computer should evaluate the data further and indicate tendencies, signal turnarounds; then, the results cannot help but become interesting.

We lack the necessary experience with operational research and modeling methods to obtain the higher level output. There are very few employees in foreign trade who would be interested in, or would at least be capable of, imagining the application of multifactor analysis, the fusion of sets of Fourrier analyses and practice, for example. For this type of level, we will first need necessary data and methods of data transfer from external, mainly foreign, data bases. Simultaneously with research, development and verification of the application of new methods, there must be further practice with their utilization and extensive data gathering.

c. Elements of Artificial Intelligence in the Management of Foreign Trade Organizations and the Commercial Operations

Despite the fact that some elements of artificial intelligence already appear in the application of 4th generation computers, the main development can be expected when the 5th generation computers are introduced. In the majority of cases, it will not be the actual replacement of the human psyche by a machine, but a strengthening of many sides of human absorption, memory and reason. The time for social decision-making by machine, even in part, remains very far off.

c1. Strengthening of Identification Abilities

The area of absorption, sorting and the preliminary evaluation of input information does not necessarily have to be understood as a specific characteristic of a human brain, but may also be a capability of a complex new computer system which can handle a large amount of varied data, compile them, separate them, or possibly suggest a structure for their storage.

c2. Strengthening of Memory Capabilities

In the newly developed 5th generation systems, there will be more than just a quantitative expansion of memory elements, but a structured memory as well, which in spite of its large capacity will be able to find information quickly and, considering its structure and the structure of the sorted data, provide fundamentals for generalizing information or on signal interesting exceptions or deviations.

c3. Strengthening of Logical Reasoning Capabilities

This is a matter of two qualitative sides of machine logic decision-making. First of all, the average quality of the old type of decision making will be increased, i.e., the flawed decision-making of humans in ignorance of the rules of logic should be prevented; then it will be a matter of simulating the top level specialist in such a way that the computer will be capable of applying the theory of fusion of sets, intuitive logic, etc.

c45. Strengthening of the Higher Elements of Intelligence

Here we have reached the present limits of knowing the capabilities of machine processing of information. There are partial results that are very promising, which may be the final results for the next several years or possibly even for several decades. It is certain that the speed of the parallel processing of information in the systems of extensive parallel processes is comparable to the speed of processing information in the human brain. Thus, there are new qualities in the combination capabilities of computers--see chess playing computers, etc. When algorithms are well prepared, in some areas the machine can surpass the capabilities of a man in the same way that the sensitivities of artificial sensors surpass the senses of humans. In contrast, the formulation of problems, organizational and original thinking can resist using algorithms for a long time.

The newer opinions and findings that thought doesn't necessarily have to be algorithmic should also be mentioned, in which case the machine processing of information would be faced with totally different problems.

d. Meeting Information Needs

The 20 years of using computer technology in the OZO show how theory and practice influence one another but also how often theory on its own is not capable of significantly influencing current practices in a certain area. While we may constntly have been missing something in the software area, certainly program packages with methods of operational research was not it. These programs, even for Czechoslovak computers, have been available for at least 10 years, despite which the foreign trade area at individual enterprises has not used them in practice.

d1. Methodical Approaches

The approaches used in the development of automated control systems in foreign trade, and which were correspondingly successful in the recent period, can be categorized as follows:

d11 Amateur approach

d12 Semiprofessional approach

d13 Professional approach

d11. The amateur approach does not necessarily mean individuals, but a group as well. This approach in the past has led to many successful and progressive solutions for automated control systems at foreign trade organizations. We can thank this approach for the fact that so many tasks were completed. One of the examples is the beginning group from the computer center at the Veletrzni Palace in the early 1970s. At that time, a group of computer buffs from different professions--mechanical engineering, electronics, heavy-current specialists, mathematicians, physicists--met and formed a group which did a lot of useful work for Motokov, Koospol, Kovo, Merkurie, and other foreign trade organizations. For data processing at Motokov foreign trade enterprises, a two-tier sequentially indexed method was developed which to this day is very interesting.

The enthusiasm which always marks the amateur approach is a very positive but insufficient element in application of complex systems using computer technology. Therefore, this method should not be relieved on in the long-term, demanding plans for automated control system development;

d12. In case of the semiprofessional approach, a role is already played by the depth of the education of the individuals as well as the groups, but also the experience of a team. Most of the rationalization brigades utilize this method successfully, not because the individuals are semiprofessionals but because professionals need not constitute the majority of the team. In this category we may include the abovementioned export operation work by the team of Engineer V. David as well as many other significant works in individual foreign trade organizations;

d12. The professional approach is the only approach that is fully covered by qualifications, experience, and the necessary time capacities. Short-term, one day a week availability for work on a team, even if the qualifications are highly specialized, would not make it possible to process very complex systems.

We will have to continue to combine these approaches in practice, but we must never forget that the demanded professional general level of solution is limited by professional approaches.

D2. The Need for Research and Verification of Application for the Management of OZOs

d21. Areas Which OZOs Must Research

--The transfer of results from economic experiment area to the exchange and data processing area;

--The methodical management of cooperation of projection capacities of more than one OZO;

--Putting the method of operational research into practice;

--Searching for the optimal size of computers for individual stages of management and individual work centers;

--Optimizing the management structure of the OZO while using the internal computer network;

--Defining information contents and its management in the enterprise superstructure sphere.

The list of needs is not complete, but the tasks mentioned above should contribute to the clarification of investment policy in the renovation and extension of computer technology in the entire foreign trade area. Current empirical experience gives no reliable indicators for the future. The total lack of standard equipment in the individual foreign trade organizations, mainly the lack of uniformity in enterprises of comparable size or dealing with similar commodities, should be a warning sign for further investment policy. Stopgap methods in a period of fast qualitative changes have no hope of being successfully applied. The external assistance to individual OZOs will have to be more broadly based than the tasks referred to above. Otherwise, they will not be able to develop at a speed which is necessary in today's world.

d22. Issues Specific to the Utilization of 5th Generation Computer Technology

In addition to the general demands of the new generation of computer technology on the complexity of solutions and to an intuitive foreseeing of new problems, we must count on the utilization of foreign language information with a full use of national alphabets, with international exchanges of trade information directly between computer systems, as well as the need to work with insufficient and inaccurate information. At the same time, we must realize that trade information has some qualitative properties that are different from scientific and technical information.

During this period, we can assume processing of many documents or the corresponding data structures using robots to be realistic. Also, the control of information exchanges with domestic partners will be significantly automated and, therefore, changed.

d23. Trade Policy and Operational Research

So long as trade policy does not become offensive, the majority of possible effects of using computer technology and the corresponding methods will not find a user. In trade policy as well, there must first of all be optimization of the economic effect against the predominating method of fulfilling indicators --fulfilling the plan.

d24. Distributing Computer Technology According to Professions

When introducing decentralized computer technology, we must take into account the capacities of this technology, the demands and program equipment. At the same time, we should also take into account the capabilities and interests of a given employee so that we can support further development of the utilization of this technology. When a general managerial employee is satisfied by data with a central character, his secretary needs equipment for word processing, archiving text, and filing. The technical employee, on the contrary, needs a personal computer with mathematical equipment and a conventional clerk needs a terminal enabling him to modify data and input data into a data base. The same way that various automobiles with exactly designated characteristics are designed and manufactured, computers for a specific, designated use are already being and will be manufactured.

D3. Robotization in Administrative Work and in OZO Management

The robotization of administrative work has its justification in foreign trade as well. The planned or demanded growth of turnover of foreign trade and the resulting increase of administrative activity should be covered fully and soon by introducing computer technology. The growing commercial demands should be met by freeing commercial employees of administrative work and replacing the freed job slots for clerks by positions for young commercial employees. Considering the age distribution of employees in foreign trade, robotization should not bring significant social problems, as the pattern makes it possible for there to be timely qualification and renewal.

The demands on the growth of foreign trade turnover and realistic possibilities of delivering new computer technology create good premises for solving the majority of foreign trade tasks, assuming that concrete measures to deal with these tasks are taken on time.

OVERTIME, FUNDING IN MINING DISCUSSED

VGMKs Pose Dilemma for Miners

Budapest HETI VILAGGAZDASAG in Hungarian No 49, 7 Dec 85 pp 52-53

[Article by Gabor Juhasz: "Miners Trap?"]

[Text] From 1 October of this year until the end of March 1986 the miners of Dorog Coal Mines who work underground can accept overtime work only in VGMKs [enterprise economic work associations[. Even though only 2 months have passed since the decision was born, creation of the VGMs [or VGMKs] has already divided the interested parties.

Overtime shifts have been practically eliminated at the Dorog Coal Mines since 1 October. Until then the miners working underground have descended into the deep 6-8 or even 10 shifts per month at the cost of their free time, mainly on Saturdays and Sundays. Of course the overtime shifts did not disappear because they are no longer needed, but because for a good 2 months now the miners are doing the extra work in VGMs. That is, the name and accounting for the weekend shifts have changed.

There is a very good reason for the change. The enterprise's wage budget available to pay for overtime work this year is near exhaustion, because the extra shifts over the plan due to last year's cold winter used up the money at the Dorog Coal Mines in the first quarter. And now winter is here again and more coal is needed than had been planned. For this very reason the enterprise management--with approval from the Ministry of Industry--decided that until 31 March 1986 those working underground may also accept extra work in VGM, because earnings paid in this are charged to the enterprise's expenses rather than the wage budget.

Before the decision the workers were informed about the new opportunity in workers meetings in the enterprise's three operations. "The work associations were organized on the voluntary basis until 90 percent of our workers affected did volunteer. Now 1,054 people are working in 49 VGMs"--says Ferenc Wagner, head of the economics committee of the enterprise trade union.

Even though the enterprise representative did not make us privy to the details of the calculations, he did reveal that much that in practice on the average the VGM pays about 50 percent more than the money paid for work done in overtime shifts. Just for the sake of an example: until now one Saturday morning shift paid a miner 660 forints on the average, while from now on theoretically it will pay 1,584 forints. A shift on Sunday morning will pay 1,900 instead of 690 forints. All this of course is true only on paper. By the time the miners receive the envelope, the"rate" for Saturday morning after the deductions is only 830 forints, and 1,020 forints for a Sunday morning. This is because many kinds of expenses decrease the income of the VGM members: taxes, the sum paid into the VGM's reserve fund, and cost reimbursement deducted by the enterprise.

Gross and Net Earnings of the VGM Members in October 1985 During one Shift at the Dorog Coal Mines (if the Norms are Fulfilled)

	Gross earnings	Net earnings
	Forints	
Saturday		
Morning	1584	828
Afternoon	1900	1019
Night	2218	1213
Sunday		
Morning	1900	1019
Afternoon	2218	1213
Night	2534	1401

After this it was no surprise that the opinion of the miners--according to their interests--is divided when the VGM is being discussed. "For the most part the young people approve of the VGM, the older ones oppose it"--says cutter Jozsef Palfistyak. The explanation for this is simple: even though the VGM pays more, earnings thus acquired do not count towards the retirement base, while the income earned from overtime shifts was considered in calculating the retirement pay base. Since the VGM replaced the overtime shifts, the retirement pay base of the workers became smaller, even though they spend the same amount of time working underground. And this is not the only disadvantage of the VGM. "Money thus earned is not counted towards the length of service reward fund. For us 'undergrounders' the length of service reward can even be as high as 19.5 percent of the annual earnings"--maintenance group leader Gyorgy Schiszler joins the conversation--"and we also lose out on the health benefits and vacation pay." Jozsef Palfistyak has also calculated that basing it on 6 extra shifts per month, the decrease of income may amount to thousands for work done in the VGM for one year.

According to those closer to retirement, the VGM is no solution, not even temporarily. And in one of the units, the Alagut Mining Operation, the age of the cutters is around 45 years. "Those born in 1937-1938 are already concerned about the retirement pay calculation"--says Istvan Radoszta, the operation's manager. They would like to work in a "job with retirement benefits" again, that is, with overtime. But they will not be able to do so until the end of March--at least not according to the present situation. That is, at this time they have no choice. Except for a few exceptions, those who want to work on the weekends have to be VGM members. "The best thing would be if there would be a choice and everyone could work in the format he wants. If he needed a lot of money quickly, he could work in VGM. If his interest is long term security, he could work in overtime shifts"--says cutter Erno Kis, and his fellow miners agreed with it.

For the time being the only thing that remains is work done in VGM. By the way, during 8 hours of this more coal is brought to the surface than during the weekdays. "There is nothing special about this, performance also used to be higher in the overtime shifts than during the weekdays"--observes Istvan Radoszta. Even though he did not quote exact production data claiming to have no comparative numbers, he did add this: the explanation for the higher performance is mainly that on Saturdays and Sundays the cutters are "going for coal," this is when they derive the benefits of preparations made during the week.

"With the passage of so little time it is not yet possible to talk about experiences but we can already conclude that the VGM is no miracle cure"--the manager summarized his impressions in conclusion. According to his position this solution now improves the national economy's energy situation and makes it possible for the enterprise to overfulfill its plan without paying additional wage taxes, and last but not least it provides the miners with extra income over the short range. But in its present form it can only be a temporary solution--he adds--and it can exist only until the decisions--often mentioned also in Dorog--are made to improve the situation of the miners. Over the longer term only the raising of base wages, construction of miners' housing and improvement of the working conditions can help. That is, in this case--this is the opinion in Dorog--there would be enough miners and they would not have to work so much overtime.

Terms of Government Fund Allocations Eased

Budapest HETI VILAGGAZDASAG in Hungarian No 50, 14 Dec 85 pp 50-51

[Article by Mrs Lorant Kismarty: "Special Finance Department"]

[Text] Until now the so-called basic state grant has been a special domestic form of loan: neither a budgetary grant nor a loan, since it had to be repaid in the form of annuities, but done so from the pre-tax profits. According to an October government order in the future enterprises will be able to receive basic state grants with more favorable conditions than before--as can be seen from the following article of a top official of the State Development Bank.

Recently the Hungarian Roller Bearing Works received 191.6 million forints as basic state grant from the State Development Bank (AFB), and the Mosonmagyarovar Metal Equipment Factory received 321 million forints. In 10 years the Debrecen people will pay back 325 million forints, the Magyarovar people a little less than 546 million (for more details about this see the 26 Oct 1985 issue of HETI-VILAGGAZDASAG). On the other hand barely a week or two ago the Tatabanya Coal Mines Enterprise--on the basis of the National Planning Commission's decision--also received basic state grants from the AFB for two major investments, to open the Many and Nagyegyhaza mines. In payment for the 7.2 billion forints received the mining enterprise in 15 years will have to pay the bank about this same amount in annuities. A little more than the 7.2 billion if the investment implemented from the loan brings in more profit than planned, and less if the profit is less.

The terms of the repayments cannot even be compared to each other, yet we are not talking about two kinds of award constructions nor that the two machine industry factories have a lesser need for inexpensive money than Tatabanya people. What explains the difference seen in the payment conditions is that during the few weeks which elapsed in the interim the government accepted the proposal submitted for the further development of the basic state grant system. According to the government order published basic state grants can be given for investments begun after 1 January 1986 with conditions similar to that of the mining enterprise's. The basic grant is a special way for domestic enterprises to obtain money. It cannot be called a loan, because, loans payments must be made from the profit remaining after taxes are paid, and only the interest can be charged off as expense (that is, built into the price of the product made). The enterprise must pay the annuity payable for the basic state grant from its pre-tax profits, so that by this the enterprise decreases its tax base and as a consequence also the tax it has to pay. In the economic sense of the word it appears that the basic grant has no interest rate, the amount received and the profit of the financial institution granting it must be repaid under the name of annuity. It is true, however, that according to the practice still in effect this year--as the examples of the rolling bearing works and the metal equipment factory also indicate--the enterprise taking advantage of the basic grant must in the final analysis pay back a similar sum as if it had taken out a loan in the same amount as the basic grant. That is, calculated by the average domestic interest rates during the 10-year repayment time the enterprise must pay into the account of the bank making the loan 170-180 percent of the sum borrowed. According to the past practice of basic state grants the enterprise receiving the grant paid back 17 percent of the amount received each year to the AFB for 10 years as annuity. And in 10 years this comes to exactly 170 percent.

This same thing raised a question about the original goal of the grant system. That is, originally the basic state grant was created for the very reason to prevent a specified group of enterprises from being forced into debts in excess of their abilities. According to analyses by the AFB not only those enterprises got into difficult financial situations in recent years, which struggled with sales and economic operating difficulties and problems. The signs of going into debt appeared besides this, mainly among the enterprises making raw materials and semifinished products, and also at those which implemented developments selected by the national economic plans.

These enterprises--such as, for example, the producers of energy sources, metallurgical operations, power plants--due to the character of production could often develop their activities only through gigantic loans. Because of the conditions of their loans they should have produced higher than average yields but this--at least in general--is not characteristic in these very production branches. Some of these enterprises tried to counterbalance the stricter enterprise regulations and the extra burdens due to the increased cost of financing by price increases. But this--as the price increase was spiraling on in practically the entier national economy--increased the inflation. In other cases finally the national budget gave these enterprises subsidies to increase the enterprise's income.

It was proven on the basis of the AFB's analyses that the conditions for enduring and rapid growth can be created at few enterprises in Hungary if only the enterprise's own resources and loans are available for this. It seemed necessary to set up a new construction for providing money by the state.

The basic state grant became this construction. By the government's resolution the enterprises have been able to obtain money in this manner since 1976, at that time only as an experiment. Until 1980 this was able to "help" only a few enterprises: between 1976 and 1980 the AFB which made the grants had only 1 billion forints available for this purpose. The experimental stage ended in 1980 and since then the enterprises have been receiving 1 or 2 billion forints per year as basic state grants. Since even this sum cannot be called too large, necessarily only a limited circle of the domestic enterprises was able to obtain it. The grant opportunities were further restricted by the fact that it could be requested only for those investments the implementation of which were decided by the enterprises rather than by governmental organs.

The problems indicated here in the basic grant system of the past led to the recognition that the system must be further refined. The government also accepted this. The size of the sum that can be spent for basic state grants will be included in the Seventh 5-Year Plan, and also after the plan is developed and adopted will the enterprises learn the details about what basic state grants can be requested.

The general conditions for basic state grants are already known today. One of the important current changes is that this construction can be used in a broader circle of developments than before:

--In the future basic grants can also be given for centrally decided developments, for example, to open mines, to build power plants. At these investments the National Planning Commission will decide the amount and conditions of the basic grant, within the framework of the investment decision.

--The enterprises can also receive basic grants if they by their own decision carry out developments selected in the national economic plans. For example, according to this the coal mines can expect basic grants because by the development they decide on they can improve the conditions of coal production--or the construction material enterprises because they would modernize or expand production of their products. Basic grants can also be obtained for enterprise developments through which energy or material can be saved. It will be learned after the national economic plan is finalized, which enterprises will finally be actually receiving the basic state grants based on the examples listed above.

--According to present thinking basic grants will be able to help create new enterprises, subsidiaries, and business associations operating with foreign participation.

Basic state grant can be given for enterprise developments if 70 percent of the necessary amount is available from other sources (also including bank loans) to the enterprise, that is, a maximum of 30 percent of a development's costs can be financed with a basic grant. Exempted from this are mining, the electrical energy, brick, shingle, lime and cement industries as well as the public service enterprises.

Among the resolutions specified by the government's order it will be decided within the negotiation between the enterprise and the financial institution making the grant--not necessarily exclusively the AFB in the future--what annuity will apply to the grant and within how long a time it has to be paid back. No state grant may be given at all for enterprise investments among the sources of which there are other grants paid by the national budget, for example, a non-repayable subsidy.

Naturally the basic state grant will not be the only source in the future either for financing domestic investments. In addition to investments implemented from own resources and from loans the various forms of budgetary assistance will remain. The enterprises can receive state loans where the budget will "take on" a part of the principle or part of the interest. The enterprises may also receive free grants from the budget though only in a very narrow circle compared with earlier years.

1984 WAGE SYSTEM EFFECTS EVALUATED

Warsaw ZYCIE GOSPODARCZE in Polish 17 Nov 85 p 11

[Article by [L.]: "More Viable, After All"]

[Text] The law passed on 26 January 1984 regarding plant wage systems allows enterprises to use wage systems which are more flexible and adequate for their conditions of operation. During a period not quite a year and a half that the law was in force, i.e., up to 30 June 1985, 2,659 plant agreements with regard to wage systems were recorded at the Ministry of Labor, Wages and Social Affairs. Such agreements went into effect at that time in 983 industrial enterprises, 442 building enterprises, 302 enterprises belonging to the agricultural sector as well as 77 transport enterprises, 123 domestic trade enterprises and 51 units of foreign trade.

In answer to the question: What is the actual extent to which the law is used? It may be said that it is still not very large. During the period under discussion, only approximately 21 percent of the industrial enterprises as a whole and approximately 25 percent of building enterprises and 15 percent of transport firms adopted the wage principles allowed by the law. The best showing in these statistics is made by units of foreign trade--the new systems are used by approximately 72 percent of these units. However, this data does not say everything. Although, the law is only made use of by every fifth industrial enterprise, it already encompasses 43.5 percent of the industry's workers while the enterprises which make use of this law contribute to as much as 51.4 percent of the country's production. The ratio in the case of the building industry is similarly arranged and this is even more pronounced in the case of the transport industry. Only approximately 15 percent of the transport industry's enterprises have introduced the new wage systems. However, they employ as much as 75 percent of the transport industry's workers. It may be assumed that PKP carries the most weight here.

Of even greater importance is the answer to the question: What are the effects of the use of the law on plant wage systems on enterprises and the economy? Thus, according to GUS data, enterprises that introduced the new wage systems as early as in 1984, today receive results better than the average for the economy. Whereas industrial production was higher by 2.2 percent during the first half of the current year [1985] in comparison with the same period in 1984, the production of enterprises using the plant wage systems was 3.7 percent higher. Furthermore, these enterprises achieved better results along with a drop in employment greater than the average for the entire industry. That is why, inasmuch as sold production per employee rose in industry as a whole by 3.1 percent, in industries using the new wage systems it rose 5.8 percent. The decline in employment in enterprises using the plant wage systems also resulted in that although the growth rate of individual wages was only 2.7 points higher in these enterprises than in industry as a whole, the growth rate of the average monthly wages was already 4 points (20.1 percent and 24.1 percent) higher. Similar trends occurred in the case of the building industries. That is why the inference that enterprises using the new wage systems on the basis of the law of January 1984 are today somewhat more vital than the remaining ones appears to be just. And even though it is difficult to measure exactly to what extent the introduction of the aforementioned law plays a role in all this, it surely is not without effect.

UNAVAILABILITY OF POLISH TRANSLATIONS OF ECONOMISTS LAMENTED

Warsaw ZYCIE GOSPODARCZE in Polish 22-29 Dec 85 p 11

[Article by Irena Topinska: "From the Point of View of the Past 17 Years"]

[Excerpt] We could continue to analyze the topics which were awarded for a long time yet. However, perhaps it would be worthwhile to take a look at them from a somewhat different point of view while asking which trends, from among those that are considered important and well-known, were not singled out for distinction. Thus, for example, the "Cambridge school of thought" is not among those honored--no one to represent this post-Keynesian trend in the economy and at the same time, one which refers to Marxist and Ricardian tradition. Awards passed by probably the best known representatives of the theory of growth (Harrod and Domar). The nonmarket economy is for all practical purposes missing from the list of awards while centrally steered systems have been totally "forgotten."

It is, of course, difficult to confirm the reason for these "blank spots." Did they come about totally by chance or did a certain tendency on the part of the academy (or perhaps of the [nominating] committee) reveal itself in this way toward singling out work related to the market economy--and this, in a rather liberal way and form? Assar Lindbeck points out that the preferential treatment of certain trends is not the result of some sort of intentional policy but is only a reflection of the current state of research in the field of economics.

Polish Editions

Not all Nobel prize winners won owing to their world renown theories as, for example, Samuelson, Hicks, Hayek or Friedman--at least in the case of the international community of economists. This should not be surprising considering that awards are not given for possessing a famous last name. However, if an average Polish reader would like to become acquainted with the output of the particular laureates--those more or less well-known--he will not always be satisfied. The case of Polish editions of the work of Nobel prize winners is not, to be sure, the worst but in certain instances, it looks strikingly bad.

Eleven laureates (Arrow, Hicks, Kantorowicz, Klein, Kuznetz, Leontief, Myrdal, Samuelson, Simon, Stone and Tinbergen) have seen the Polish translation of one or several books come about. It is possible to eventually get a hold of, though with great difficulty and sometimes simply by chance, the Polish editions of the work of the following seven economists (Frisch, Hayek, Lewis, Mead, Ohlin, Stigler and Tobin). And what about the remaining ones? Particularly, the inaccessibility of the works of Schultz and Friedman and for all practical purposes, also those of Hayek and Lewis seems to be disquieting. These are commonly known authors who express themselves on current issues of interest to everyone. Why not make it possible for every student of economics to acquaint himself with the views of Hayek in a discussion with Lange? Why should the average reader not find out something about positive economies, about finances or the "human capital" concept?

It would be desirable for the world of economics to stop being accessible only to professionals so that everyone could read in Polish at least some of the work of all the Nobel prize laureates.

REFORM SEEN AS THREATENED BY CONSERVATISM

Warsaw ZYCIE GOSPODARCZE in Polish 10 Nov 85 p 12

[Article by Janusz Ostaszewski: "Against Harmful Alliances"]

[Text] The cream of the crop of Polish economists gathered in Katowice at the most recent conference of the Polish Economic Society is faced with a difficult task. The society has taken upon itself the role of a collective expert and consultant and at the same time, it has proclaimed a motto that the reform cannot fail. Therefore, the Katowice deliberations must produce a clearly and directly formulated assessment of the reform process as well as concrete proposals of action which this process would continue further.

If the reform could occur as a purely economic process and if it could come down to the imposing upon management of rules and regulations specified by laws and an economic account exclusively, the matter would be simple. It appears that a portion of fervent advocates understands it [reform] in this way but so does a part of the staunch opponents. Some appear to overrate the possibilities of self-regulation whereas others are hooked on a mirage of the omipotence of the institution of state and believe solely in centrally conceived regulations introduced by dictate.

Because we have tested thoroughly and at the same time painfully the ineffectiveness of activity based on the second of the aforementioned ways of thinking--we dismiss it. However, careful thought also prohibits the testing of the first method directly on live, as it were, human beings. Above all, because it is a truism that reformation is a social process. Therefore, from this issues forth the system of influential forces on the success of reform formulated by sociologists a rather long time ago.

Pure self-regulation, to say nothing of doctrinal considerations, would have to, after all, result in a drastic unsettling of the social feeling of security. If the reform were to strike too drastically against the quality of life of large social groups, then a sharp protest could be expected against such methods and policies which led to its [reform] introduction. Therefore, in anticipation of such a scenario, policies must steer a middle course between coercion and donation and play by compromise. In effect, therefore, the reform takes on a rather clumsy shape--it is not fully consistent and as a result not fully effective.

However, it is a fact that currently we have a situation in which policy appears to be giving in under the pressure of conservatists, who not feeling a strong bridle, are ready to take us to regions which are even more crisis causing than those proposed by radicals. Therefore, we find ourselves in a period in which it is becoming increasingly more difficult to protect ourselves against the fear that something has already been muddled and that we are threatened with long-term stabilization on a minimal level.

Will the voice of economists be capable of turning the scale so that the reform could not be unsuccessful?

Compromise has given rise to a situation in which an alliance of the weak has come about. Prof Wladyslaw Baka expressed this very clearly in a commentary entitled "The Most Difficult Thresholds" published in the 62d supplement of RZECZPOSPOLITA--"Economic Reform." This refers to the alliance of weak cadres on the central level, which do not have the ability to find solutions in accordance with the new rules of the economic game, with weak cadres in enterprises, which do not know how to use their imagination, initiative and resourcefulness without having them imposed from the top. This pact of the weak hurts the reform and is gaining strength. It is capable, by circumventing or downright breaking legal principles and political declarations, of winning over using the old carrot on a stick method, those portions of large social and professional groups that also are not very disposed toward taking the risk of competing for better wages for better work and assuming the risk of self-government and its consequences.

Therefore, it is the obligation of economists to warn policy about the consequences of this alliance, although, this will not be an easy task.

It so happens that the driving force in this pact of the weak are people, who surrounded by an aura of supposedly precise thinking, have an unrestrained tendency toward the mechanical shifting of technicalist rules and regulations onto social life. Economics is not an exact science and its voice sometimes seems weak in the face of loud statements that two plus two equals four. However, this is not the case in this specific addition; such a formula is false and economists must find convincing proof of this.

There are two large professional groups which cooperate with each other on the bottom as well as on the top rungs of the ladder which regulates economic life. These are engineers and economists. In discussions that are carried on between them, they speak to each other on two different wavelengths and instead of coming together and synthesizing, their ideas separate and go in opposite directions. At the same time, however, these groups can have a decisive influence on whether the reform will be a success. Therefore, in order to assure the success of the reform, it is the task of economists to work out a plane of understanding and a platform on which an alliance in the interest of the reform, in the interest of the future of us all would be possible. The Katowice forum could do quite a lot in this regard; begin a dialogue that would unify accounts. After all, it is a question of obtaining a minimal level of social losses from this accounting. Separate settling of accounts, forcing one's way alone toward recognition by adhering to the binding stands of one or the other group leads to nowhere.

Therefore, an alliance of the strong is necessary. Only then will the voice of economists not be suspended in midair again as had been the case so many times before but will become a determining factor for decisions which will outline the future in colors brighter than is the case now.

PRIORITY URGED FOR MANUFACTURING OVER EXTRACTIVE INDUSTRIES

Warsaw POLIMERY in Polish No 4, Apr 85 p 164

/Text/ We have never overemphasized the fact that our industry is aging. Of course, we were referring primarily to chemicals, but not only to them. Especially since our lag in development is something of which all strata of society are finally becoming aware. But there are industries which are even more behind than the chemical industry.

I do not know if anyone has calculated a kind of "backwardness coefficient," or what kind of criteria he might have used. Perhaps it could be a comparison of the dates when we and our rivals began certain kinds of activities, perhaps it could also be the basis for calculating how much time (and time is money) we would need to catch up with our competition, which also would not be standing still. In time even our most modern enterprises puchased abroad will not be as good as supermodern ones. The plans of our factories could be simply copies of our competitors' enterprises. But if only we had in our desk drawers at research centers continually updated projects, always ready to be put into operation... Dreams do not cost anything.

Obviously, even the best projects are not enough if we continue to use outmoded procedures, organization, and generally accepted industrial priorities. We must learn to be frugal, to be efficient, to live with pencil in hand. Let us free ourselves of the mentality of raw material suppliers, especially since our supplies of raw materials in many cases are coming to an end, not to mention the fact that our deposits are becoming even poorer, and therefore more expensive. Even our coal deposits are not inexhaustible, and they are getting deeper and deeper, and therefore mining them is becoming more and more costly.

We must give priority to manufacturing over extractive industries: to finished over semi-finished products, to semi-finished products over raw materials. We must encourage the development of the chemical industry, modern electronics, computers, nuclear technology, and other industries which are just emerging, e.g. genetic engineering, etc.

As a model we could take Finland: a wealthy and industrious country, although poor in raw materials. Aside from rock, water and air, the Finns have only one raw material: wood. But both they and the rest of the world know that they have to begin economizing on wood.

Let us try to be Finns.

HIGH HOPES FOR CYCLOHEXANONE PLANT EXPORT SALES

Warsaw POLIMERY in Polish No 4, Apr 85, p 165

/Text/ The more than successful start-up of a cyclohexanone plant in Strazke (Czechoslovakia) built by Polimex Cekop has aroused the interest of specialists from many countries. It should be recalled that this technology was created by scientists from the Institute of Industrial Chemistry and from the Nitrogen Plant in Tarnow; they are responsible for many new inventions.

In a move unrelated to the plant in Strazke, the Spanish firm "Productos Quimicos del Mediterraneo" has hired our specialists to modernize a similar plant built by the Swiss firm "Inventa." Incidentally, with regard to the Polish technology, the Swiss cautiously expressed the opinion that it holds no promise for the future (especially for sale abroad). After the beginning of cyclohexanone production in Polish plants and the start of construction of the Strazke, the Spaniards concluded that their original technology (i.e. the one based on the Swiss plan) is not as advantageous as the Polish one.

In view of this, the Spanish firm to completely rebuild the production unit, which was operating under rather difficult conditions, oxidation under a pressure of 1 MP at a temperature of 100°C. The modernization led to a reduction in consumption of raw materials and prevented the accumulation of sediment during production. When the modernized plant began operation in the summer of 1983, the results were so good that the client waved his right to test the product.

The next Polish cyclohexanone plant will be built in the Soviet Union. There are hopes for increased sales of licenses, especially to the capitalist countries.

ECONOMY POLAND

BRIEFS

REDUCING NEED FOR IMPORTED PLASTICS--Felt factories in Lodz, the Scientific Research Center for Rubber and Vinyl Products in Oswiecim and the "Chelmek" Southern Leather Factory have jointly developed a type of adhesive material for producing so-called stiff toes and heels to replace imported thermoplastic materials. By the end of 1984 the Lodz factories were to produce 15,000 square meters of material for "Chelmek." In 1985 deliveries will amount to 200,000 square meters, thanks to the installation of a new sewing machine bought with funds from the parties concerned and ministrial allocations. Those 200,000 square meters will be worth 350,000 dollars. Total consumption in Poland of stiff materials amounts to 550,000 square meters. More cannot be made until a new carding machine is installed. Carding machines are being built by "Befama" in Bielsk-Biala, and will not cost any hard currency. Other shoe factories are also interested in this invention. /Text/ /Warsaw POLIMERY in Polish No 3, Mar 85 p 123/ 9970

IMPORTED DENTAL MATERIALS CUT--Among the new discoveries of the Scientific Research Center for Rubber and Vinyl Products in Oswiecim, of particular interest is the solution to the problem of dental materials, which hitherto have been imported from the U.S. and are very expensive. Incidentally, the Mifama company of Milan has bought the license. The head of the Center's production plant, Dr Ludwika Wlosinska, produced a material which closely meets requirements. Due to the small scale of production (around 30 tons per year), Oswiecim was unable to cope with the task, but the Synteza cooperative in Poznan took an interest. Production began in August 1984. The cost of production, according to calculations of the Oswiecim Center, is about 600,000 zlotys per ton, while the foreign supplier charged 1,700,000 zlotys per ton (in dollars). This is clearly a very profitable business, especially since no country in the socialist bloc (except Czechoslovakia) produces dental material of the same quality as that of Synteza; even the Czechoslovak material does not meet the standards of the American prototype. Encouraged by this success, the Research Center in Oswiecim has started work on developing further materials of this kind. /Text/ /Warsaw POLIMERY in Polish No 4, Apr 85 p 165/ 9970

CONTINUING FRAGMENTATION OF ECONOMY REVIEWED

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian 10 Nov 85 pp 22-24

[Article by Scepan Rabrenovic: "Nations and Economies"]

[Text] Last week in Sarajevo, Yugoslav economists spent two days arguing about whether national economies are suitable for Yugoslavia or not. Sarajevo was overcast and cold on those days, and freezing at night because of the reduction in electricity, so that little could be seen of the Olympian glow that is still said to illuminate this city and its residents. This reduction in electricity was evidence of how much many divisions in Yugoslavia have gone too far, even in those economic and technical systems which are after all indivisible in other countries -- energy, for example.

Two days before this discussion, the Social Accounting Service of Yugoslavia published the fact that only 0.29 percent of investment funds crossed republic and provincial borders.

In spite of the large number of economic facts presented in this discussion, our impression is that it was more ideological than economic. Not by chance: we seem to be living in a time of total ideology. Not only the basis of industrial production was ideologized, but also the rain that fell in Sarajevo on the second day of the discussion, since it indicated that the reduction in electricity might end and thus contribute to rectifying many divisions.

When the Institute for the Study of National Relations of the Central Committee of the League of Communists of Bosnia-Hercegovina, which hosted this discussion, publishes all of the proceedings, everyone will then be able to convince himself that the ideological divisions that occurred in this discussion are in fact the same divisions that occur when discussions are started about changes in the economic and political systems.

Nation and State

Most of the misunderstandings and disagreements occurred after the statement by Dr Hasan Hadziomerovic, who said that the very concept of national economies elicits psychological reactions to nationalism, "but if one bears in mind all the positive values of the nation, then it should be used boldly," since "the republics and provinces arose as a historical form of the solution of national issues." In spite of the principle that every national economy has its own account, Hadziomerovic continued, a national economy does not have to be closed, and it does not have to be against rational systems: "The state as an institution is one thing, and the nation is something else. The nation remains if the state fades away. Under our conditions the republic reality is taken from national reality."

In response to a question from Dr Franc Cerne, "Then how was Bosnia-Hercegovina created in accordance with national composition?" Hadziomerovic replied, "There were reasons when one state was formed in that region, since historically three peoples have lived in that region."

For Dr Stjepan Lovrenovic -- who was not the only one at this discussion to defend this thesis-- it is more correct to speak of the economies of the republics in the economic system of Yugoslavia, than of national economies: "The republic economies are not anything new; they were even provided for in the 1946 Constitution, but their autonomy, especially in the area of the economy, has been hindered by the centralistic functioning of the federation. The sovereignty of the republics would be merely in name only without economic sovereignty."

For Dr Dusan Icevic, Yugoslavia is a "conditional federation," and "the national economies are maintained by the state ownership of national capital," while the existence of separate republic monetary-credit systems, and even republic anti-inflation programs, is viewed by Dr Ksente Bogoev as proof of the nonexistence of a unified Yugoslav market in this country.

"It does not matter to the working class whether it will be hired by a capitalist, the state, or a political-bureaucratic authority," said Dr Zivko Surculija.

For Dr Zoran Pjanic, the rector of the University of Belgrade, who delivered the opening speech in Sarajevo, there is no dilemma: "Either national economies exist, and then the view is valid that there is exploitation of one nation by another, the less developed by the more developed, which is after all our official position with respect to the international economic order, or we are a unified economic region in which republics (and provinces) exist on the political level, which means that regional problems become stronger, but they do not exceed their normal bounds."

On the Exploitation of the Nation

According to Pjanic, after the 1974 constitutional amendments that provided two principles, the sovereignty of the republics and the unified Yugoslav market, the possibility of a conflict between these two principles was left aside. Since that time the term "national economies" has been used, but it cannot be adequate for Yugoslav reality, "since only one republic is nationally homogeneous, in four one can identify a majority presence of one of the peoples, and in the last one, the sixth, it is not even possible to do that."

If one examines the main economic trends in Yugoslavia over the last 10 years, Pjanic says, because of the suppression of the commodity economy and the condemnation of the market method of association as a remnant of something old and obsolete, and because of the unsuccessful attempt to resolve the pluralism of self-managing interests through a universal system of consultation and agreement, room has been cleared for the emergence of etatism, especially republic and provincial etatism, and the use of the term "national economies" represents an aggressive attempt to defend republic and provincial etatism, which is based on weak theoretical foundations and is not successful in concealing its nature: "In many respects the situation in Yugoslavia resembles a common market, while the remains of the unified market make possible persistent transfers between regions that are not based solely upon greater productivity, but rather upon a monopolistic position, and many other things."

And it is precisely the fact that out of the entire Stabilization Program only one part has been implemented, the realistic valuation of money through interest rates and the realistic valuation of the dinar through the exchange rate, Pjanic says, that has led to a transfer of income to the republics that had more social capital in monetary form and more foreign exchange.

Another method that allows a transfer of income to the developed republics is price disparities, and thus also disparities in wages: "Since this unequal distribution of personal incomes also has territorial characteristics, it becomes clear why some areas have offered such strong resistance to the idea originating from the highest political bodies, concerning recognition of the duality in the position of working people in self-managing socialism, as a result of which their personal incomes should have two sources: one that is measured by their contribution as producers, and that cannot have any other definition except that the same income is obtained for work that is equal in quantity and quality, and another that is derived from their role as decision-makers in the economy, as those who replaced the capitalists, and that is measured according to success in preserving and increasing social capital. The application of this idea would certainly lead to a redistribution between industries and territories, but the results at the level of the entire country would be positive."

Does a Serbian National Economy Exist?

Dr Zoran Popov said in Sarajevo that the problem of the unified market does not exist, and is not explained, in any foreign economic literature, much less terms like "strengthening the unity of the market" or "disrupting the unity of the market." This concept appeared for the first time in Yugoslavia in the 1974 Constitution, but before then the unified market was implied.

Popov explicitly asserted that the economic sovereignty of the republics cannot be reconciled with the unified market.

If national economies exist, Dr Ljubomir Madzar said, then one must raise the following question: what is the national economy of the Serbs, if one knows that they live in Serbia, Vojvodina, Croatia, Bosnia-Hercegovina, Montenegro, and Kosovo?

From the most superficial angle, Madzar claims, it appears that the republics and provinces behave similarly in implementing economic policy, regardless of the degree of national homogeneity, and attempt in the same way to protect their own economic interests: "Nationally heterogeneous communities, like Vojvodina and Bosnia-Hercegovina, behave like the nationally homogeneous communities. The Serbs and Hungarians in Vojvodina act in a united manner, while the membership in the same nation of Serbs from Vojvodina and Serbs from Serbia is no obstacle at all to their taking fundamentally different positions on major issues. It appears from this that the behavior of the republics and provinces is not determined by nationality, but rather by economic-systemic solutions."

In spite of the great differences in development and the interests derived from this, Madzar claimed, it can be said that workers, peasants, and part of the intelligentsia are not interested in divisions in the country. The ones most interested in divisions are the so-called political vanguard, which has been joined by part of the intelligentsia, namely the part that, like the political vanguard, viewed division as a chance for its own social advancement. This is the reason for so many educational, cultural, scientific, and other institutions: "The role played by the political vanguard in the divisions is very important, since the social standard of living in the individual parts of the country depends, among other things, upon the extent to which the political vanguard fights for corresponding growth -- to a considerable extent at the expense of others. Since it is divided in accordance with the logic of republic and provincial borders, the political vanguard has to a certain extent divided the people themselves."

How Much Do the National Economies Cost?

Dr Risto Vukcevic, speaking about the divisions, emphasized that a rational process of production cannot exist within the framework of one country, no matter how large and well-developed, and Dr Dragoje Zarkovic commented that the national economies, after the foreign and domestic debts, are the country's greatest problem, costing about $2.5 billion each year, i.e. approximately as much as the annual interest on foreign credits.

In response to a question about why there are national economies in Yugoslavia, Zarkovic said, "The Federation, in the period until 1971 or 1974, did not create equal conditions for doing business -- earning and distributing income. Some industries were privileged in many respects, and others were in a very unfavorable position. In our complex conditions, this had to have a territorial and national dimension. The differences in the degree of development of individual republics began to be intensified, and this led to the disillusionment of those who were affected, and even to an increasingly greater dissatisfaction with the federation."

Zarkovic concluded his statement as follows: "Are we in the position of the sorceror's apprentice who knew how to let the devil out of the bottle, but not how to put it back inside?"

There were assertions at this discussion that everything that had happened was a consequence of the "low awareness and insufficient knowledge of our people, and so the centers decided without them." Such assertions are in fact an alibi for the mistakes of all the centers of economic and political power.

[Boxed article by Kiro Gligorov: "Predominance of the State"]

[Text] When one discusses the problem of "national economies," the following items determine their nature under our conditions.

a) the commodity nature of our economy,

b) the arbitrary determination that economic relations take place in a unified Yugoslav market,

c) the inevitability of an increasingly more rapid participation in the world market, which is still stressing the third technological revolution as a condition for the progress of each economy,

d) the earning and control of the real product is the right of numerous economic subjects, based on market verification of the results achieved. In accordance with this, economic equality should be reflected above all in the fact that the economic subjects are the ones who should be the main factors in this process. The rights and duties of all sociopolitical communities are derived from this, and they affect the smaller portion of the social product that is intended for general and community needs. This applies to both republics and provinces. Their rights to guide the economy in a unified market contain measures of economic, social, and development policy, if these measures are not under the jurisdiction of the federation (general business conditions). Everything else is in the sphere of the full free association of economic subjects in the unified market, on the basis of "market justice" and the solidarity of the working class in regard to correction of the consequences of the market that are not in accordance with the nature of the socialist self-managing system.

Thus, there can be no usurpation of income and the surplus of labor by the nation, and if there were no mixed composition in all the republics and provinces, this could not even be done by the republic state in the name of the "nation."

When this is mentioned and one has insight into this, one can demystify the concept of the national economy, and the concern of the nation or its state for controlling the surplus of labor and ensuring the economic equality of all federal units, i.e. all peoples and nationalities. This concept can be reduced to the natural interest of each sociopolitical community in ensuring as successful as possible a development of the economy on its territory, through methods and means of an economic nature, while taking into account the fact that the main economic subjects are the factors who should control the income earned in their own best interest, and this, it will say, is also in the best interest of their narrow social community and of the entire Yugoslav community.

Any other treatment of national economies throws open the door to etatism, the expropriation of economic subjects and self-managers, with voluntarism becoming the main means of regulating economic flows. Relations among economic subjects lose their economic and market nature, while national interests are used to conceal an etatist encroachment upon workers' incomes and the surplus of labor. There is only a small step from this to a call for everyone to stand behind the "national interest," as it is seen by the bureaucratic and etatist structures, and to oppose other such "national interests." This has been frequent in practice.

DELETERIOUS EFFECTS OF INVESTMENT IN STOCKPILING NOTED

Belgrade NEDELJNE INFORMATIVNE NOVINE in Serbo-Croatian 17 Nov 85 pp 18-20

[Article by Branko Colanovic: "Misuse of 'Monetary Illusion'"]

[Text] How do stock reserves wreck the standard of living? A restrictive policy could yield results only under the condition that a larger number of workers lose their jobs. And that is not possible in our country.

Investments in working capital have become greater than investments in fixed capital. As things progress, the economy will suffocate under the weight of stock reserves.

The disproportionately high level of working capital is proof of a profound breakdown in the structure of economic forces. The objectively large amount of unnecessary stock reserves contributes to low production. The consequences for the country's financial balance are quite serious; the balance of payments suffers and inflation is sustained.

If they have grown exorbitantly, all forms of working capital are equally undesirable. Assuming that purchasing departments anticipate accurately, excessive stock of raw materials or semi-finished products is a consequence of the unsettled state of the domestic economy, the unreliability of cooperative ties, disorderly imports, etc. The excessive level of uncompleted production has the same cause, although its roots may be in the weaknesses of the organizational and technical guidance of production. The overfilled warehouses of finished goods are a consequence of weakness in planning and commercial services, of the poor quality of the product, of high selling prices and other things, but here as well the failure of economic policy, its inability to bring together in a well-organized operation all the factors that determine the speed of working capital, has a considerable influence. In short, to the extent to which the actions of the internal economy of enterprises do not rest with high-quality manpower, and if economic policy is wrong, the paralysis of working capital is inevitable.

During the five-year planning period that comes to an end this year, the share of economic investments in fixed capital in the realized social product continually fell while the share of investments in working capital rose steadily. This variance has developed into a paradox.

Table. 1

Year	Fixed Capital	Working Capital
1980	24.3	10.0
1981	21.5	13.3
1982	20.2	13.1
1983	16.4	14.3
1984	16.1	14.5
1985 (estimate)	14.5	15.5

It can be estimated conditionally that a share in the social product of about 25 percent for investments in fixed capital of the economy corresponds approximately to what is necessary in our current stage of development. In this sense, 1980 satisfied the criteria. However, the period that followed must, from the point of view of an appropriate policy of development, be considered entirely unacceptable.

In 1980, investments in fixed capital of the economy were nearly 2.5 times higher than those in working capital. In 1985, fixed investments will be almost seven percent less than those in working capital!

Portrait of a Five-Year Period

Assuming that the quality of manpower in the economy is not worse at present than it was 5 years ago and that the potential performance of the internal economy of enterprises is not lower, it must be concluded that the causes of stagnation in such a large part of the country's social product, in the form of unproductive working capital, lie in the inappropriate development of the economic system and in errors in economic policy.

A portrait of the five-year period from 1981 through 1985 with respect to the evolution of the social product and its distribution is as follows: social product stagnates because its average annual rate of growth is only 0.8 percent, which is the rate at which the population increased; investments in fixed capital in the social product drop in absolute terms from year to year, since they amount to some 930 billion dinars in 1980 but only 550 billion in 1985 (at 1983 prices). All other aspects of consumption fall sharply; only investments in working capital climbed by leaps and bounds; the net amount of foreign exchange of goods and services adds about 8.4 percent to the country's 1980 social product, and about 5.4 percent in 1985; thus, the available resources for consumption this year are about 9.5 percent less than in 1980.

Changes in the use of the (stagnated) social product can be seen more clearly in this table, which shows individual aspects of consumption in the social product (in percentages):

Table 2.

Category	1980	1985
Personal consumption	53.2	48.3
General consumption	5.2	4.8
Communal consumption	3.9	3.8
Fixed investments in economy	24.3	14.5
Working investments in economy	10.0	15.5
Non-economic investments	9.4	5.8
Statistical error	2.4	1.9
All consumption	108.4	94.6
Foreign trade balance	8.4	-5.4

One of the critical data in this table relates to the foreign trade balance of goods and services. The sum total of trade noted in this table in 1985 compared to 1980 amounts to 13.8 percent of the social product. In simple terms, this means that compared to 1980, we have, in relative terms, that much less available capital for consumption this year.

Question: In the absence of these resources, what aspects of consumption has economic policy curtailed?

Thesis: It has had to cut domestic consumption, but not to the extent that it has in fact been done; the share of personal consumption in the social product in 1985 is less than that of 1980 by 4.5 "index points," while the share of investments in working capital is larger by 5.5 "points"; non-productive resources have swallowed that amount lost by personal consumption.

Let us look at this trend in the light of actual figures.

In 1980, available resources for consumption amounted to 4.375 trillion dinars (1983 prices), to which the domestic social product contributed 4.039 trillion and the balance of foreign trade 336 billion. In 1985 (estimated, at the same prices), the social product is 4.195 trillion, but the available resources for consumption are only 3.968 trillion, since the foreign trade balance, amounting to 227 billion, appears as a debit, as a result of foreign debt repayment obligations. The reduction in general consumption, communal consumption, fixed economic investments, non-economic investments and "statistical error" (!) adds up to 533 billion dinars, thus nearly the same amount as the lagging "contribution" of the foreign trade balance in goods and services (563 billion).

In contrast to all this, investments in working capital are larger in 1985 than in 1980, by 248 billion dinars, absorbing four-fifths of the increase in social product and the entire absolute drop in personal consumption as noted above, amounting to 122 billion dinars.

This is perhaps difficult to understand, or when it becomes clear it is very unpleasant.

The increase in working capital (stock reserves) has not been of use to anyone. If the coefficient of working capital in the Yugoslav economy was already unsatisfactory in 1980, it was inadmissibly worse in 1984 and 1985. Over the course of 5 years, as we have said, real social product increased at an average rate of 0.8 percent, while investments in working capital rose at a rate of more than 11 percent.

Let us for the moment set aside the unquestionable truth that we have had, in the available factors of production--including the country's objective foreign exchange potential--at our disposal all the materials and human conditions necessary in order for social product not to stagnate. Had we known how to, or been in a situation to take advantage of these conditions, the growth in social product would have had to be sufficient to neutralize the unfavorable effect of the altered foreign trade balance in goods and services and to make a large part of the sacrifices and self-denial in the area of consumption unnecessary. However, we will raise a question here: why have we arrived at such an unnatural expansion in working capital and are we aware of the extent to which this giant tumor is dangerous to the body of the economy?

Erroneous Strategy

Institutional causes are, at least chronologically, first in line. To the extent to which the so-called national economies of the republics and provinces have finally taken shape as isolated units, thanks to the constitutional changes and the well-known "system laws," with obvious aspirations towards autocracy, it had to become clear that the market cannot be united to the necessary degree. Its crisscross pattern, the subordination to republican and provincial authorities with respect to prices and personal income, import rights, commodity reserves, the covering of losses, bank capital, the utilization of foreign capital, etc. in itself had to lead the greater creation of stock reserves, in view of the nonconvertibility of the dinar. As a consequence of this, it was necessary to pay a heavy price, either with respect to personal consumption or to the competitive abilities of the Yugoslav economy in international affairs.

However, the current economic policy has caused this price to be even greater. Its distinctly restrictive character, which is in fact an erroneous anti-inflationary strategy, is leading investments in working capital towards hypertrophy.

The remedy for the rapid rise in inflation in the period from 1979 to 1982, as well as for the increasing difficulties in the balance of payments, was sought in the limitation of all forms of domestic consumption, along with a reversal towards the export trade. Unfortunately, this medicine turned out to be inappropriate for Yugoslav circumstances. It was not difficult to achieve a reduction in domestic consumption, but for that reason the social product fell into stagnation, exports were diminished, and inflation rose.

Unacceptable Way

The restrictive economic policy began several years before the famous action by the International Monetary Fund, which was linked to the organized, international deferment of Yugoslav debts. Compared to 1980, 1981 saw a reduction in personal, general and communal consumption, as well as in non-economic investments and in economic investments in fixed capital. The only increase was in investments in working capital! And this was repeated for the most part between 1981 and 1982! During 1983, the International Monetary Fund appeared on the scene. Before that, we had already seen how strongly the cut in imports contributes to the deadening of growth in social product, and in this way to an absolute fall in exports.

All these drastic turnarounds turned out to be detrimental to the normal functioning of the economy. The economy's links with material and energy supplies, either from domestic sources or from imports, its cooperative ties, its collaboration in the marketing of exports, etc. were thrown into disorder or even discontinued entirely.

The restrictive economic policy might have had some positive results if its program had allowed for the widespread firing of workers. Fortunately, a way such as this is unacceptable to us.

Indeed, for understandable socio-political reasons, new employment has continually progressed with great intensity. In the period from 1981 to 1985, employment in the social economy grew at an average rate of 2.4 percent, three times higher than the social product. It is true that it might have been better to turn to the development of agriculture, including on an individual level, as well as to the development of the small economy, where it would have been possible to bring about significant new production and employment, but that is beside the point here.

The controversial trend whereby personal consumption, as the driving force in the distribution of social product, is continually falling, both in relative and absolute terms, and whereby the number of those employed in the social sector is steadily and appreciably on the rise, has led to substantial changes in the situation of both the working man and the citizen.

Although the number of inhabitants, employees and pensioners is rising, all forms of income by the population are for the most part falling in absolute terms. This can be seen from the following table depicting figures in billions of dinars, according to 1983 prices:

Table 3.

Net personal income, etc. in the social sector	1,487	1,310
Pensions, disability, etc.	414	340
Personal income in the private sector	217	199
Funds from communal consumption and credits	174	93
Income from abroad	318	271
Natural consumption	195	206
Other income of the population	99	428
Total income of the population	2,904	2,848

If there had not been enormous growth in "other" income, in which the primary jump was due to revenues from interest on savings and to variations in the exchange rate, it would have been difficult to conceive of a balance in the income of the population. Indeed, this "other" income practically made up for the entire real drop in those forms of income of the population that were subject to the restrictive economic policy; namely, personal income, pensions, disability and funds from communal consumption and credits. However, there are two serious distortions present in this. First, the growth in income from interest and variations in the exchange rate was paid to the population by the economy. Secondly, this income fell to the holders of savings accounts and of foreign currency reserves, sustaining a serious degree of social disintegration.

Naturally, it appears that employees, pensioners and other citizens should request compensation for such a substantial drop in their real income from normal sources. If, for example, the average employee in the social sector of the Yugoslav economy has in 1985 had 25 percent less real personal income than in 1980, he will certainly be deemed eligible for any possible compensation. He will apply for it first of all in his own property, diminishing interest, which has been falling in real terms for several years, or subsisting from housing investments, non-productive services and the like, where we also see a drop in 1985 compared to, say, the three year period from 1980 through 1982. But he will similarly endeavor to actualize a second, "special" compensation, either by curtailing his work hours in order to work on his farm or in unregistered trades, or by renting out a room to foreigners or dealing illegally in acquired foreign currency, etc.

But if, amidst a stagnating social product, all this does not offer possibilities for compensating for the drop in real personal income, there remains yet another way out, even if it is of a transient nature. Under the weight of socio-political circumstances, it will seem opportune for real personal income to increase through the rapid, universal raising of nominal values. The results of profitable business, a turnaround in income, productivity, etc. can be realized on the side!

We are observing just such a phenomenon in the middle of this year. The following table indicates the index of real, net personal income per worker:

Table 4.

Region	January-June 1985 compared to January-June 1984	June 1985 compared to June 1984
Yugoslavia	98.1	101.4
Bosnia-Herzegovina	98.2	100.8
Montenegro	99.7	97.0
Croatia	96.8	97.8
Macedonia	93.4	93.4
Slovenia	104.2	110.8
Serbia total	97.3	101.3
Serbia proper	98.7	103.1

Kosovo	99.2	102.1
Vojvodina	93.5	96.6

The phenomenon gains in proportion. If the period from January through June of this year is compared to the same period last year, only in Slovenia is real, net personal income per employee greater than last year, and there it is very substantial. But comparing June to June reveals that other areas are included in the same "process": Serbia proper, Kosovo and Bosnia-Herzegovina, while Slovenia registers growth of as much as 10.8 percent.

In this way, the restrictive economic policy becomes its own opposite. The reduction of "all forms of consumption" and imports has curtailed production and exports, but raised production costs. Severed trade connections have led to an unnecessary increase in stock reserves. The small amount of remaining space for personal consumption leads ultimately to a disproportionate growth in personal income.

Will the transfer of inflation from one republic or province to another continue? Will we eventually be left with the fact that, through the misuse of the "monetary illusion," we accept inflation as the only way to prevent dangerous socio-political crises?

Outlines of the new plans, for 1986 and for the new five-year period, foresee an abandonment of the policy of stagnating social product. But if these plans are just wishes, then we have already had them before. In order to bring about a shift in trends, towards rapid growth in production and productivity, it will in the end be necessary to change a great deal in both the economic system and economic policy. Or perhaps also in those parts of the political system that serve as a prerequisite for the vigorous economic course that we need so much.

BERISLAV SEFER DISCUSSES STANDARD OF LIVING CRISIS

Zagreb DANAS in Serbo-Croatian 19 Nov 85 pp 11-14

[Interview with Berislav Sefer, chairman of the Yugoslav Conference on Social Activities, by Djuro Zagorac: "Differences Without Limits"; date and place not specified]

[Text] [Question] Comrade Sefer, you were a vice president of the Federal Executive Council, and you are now a delegate in the SFRY Assembly, but you have never left the field of social policy: you are one of the few professors of "social welfare" in our country, and you are the chairman of the Yugoslav Conference on Social Activities. How do we stand, and what can we hope for in regard to social welfare?

[Answer] The standard of living as a whole, according to all of its indicators, is already declining for the sixth year in a row. The largest and most serious decline is in the real earnings of workers. They have been reduced by 30 to 40 percent; I would even say closer to 40 than to 30 percent. Furthermore, let me say that real earnings have declined more rapidly in social activities than in the economy. Although the joint needs have been revised, what we call the social standard of living, the share of education, health, culture, and science in the national income is now exceptionally low, and has reached the lower limit in all of its parameters. Today, we are allocating from 4 to 4.5 percent of the social product for education, and approximately the same for health care, and that is on the scale of the lower limit for Europe. Social activities have also been greatly impoverished, which has impacted heavily upon the quality of services, and this also affects the standard of living. Next, there is housing construction, the stagnation of which began much earlier; this stagnation is continuing, and as a social phenomenon, it is very serious. We speak of housing construction as an investment, but in fact this is a question of our not being able to break through the production barrier of 6 apartments per 1000 inhabitants. And until we are producing between 10 and 12, we will have a housing crisis. When we speak of the social side of housing construction, we should talk much more about the problems of the production of apartments, instead of constantly talking mumbo-jumbo about housing systems, as if the system should solve the problem of Yugoslav unproductivity or as if the foreign exchange system should solve the problem of the Yugoslav economy's ability to compete.

The decline in the standard of living is also being manifested in numerous other indicators, among which the growth of unemployment is certainly the most pronounced. The decline in the standard of living has also fundamentally reduced buying power, and thus also the extent of the satisfaction of people's general needs.

[Question] It is clear that the decline in the standard of living has a direct effect upon the social situation. What is going on with all of this, and what is shown by the research that the experts of the Institute for Market Research in Zagreb conducted for your Conference?

[Answer] The extent of the satisfaction of needs should not be viewed just as a phenomenon of living better or worse, but also as a phenomenon related to the very possibility of subsistence, especially for individuals and families. It is obvious that part of the population has reached a low, minimum level of the standard of living. One fact is very indicative -- more than 50 percent of the families in Yugoslavia are spending 43 percent of their total incomes on food, whereas if living conditions and the standard of living are well-developed this normally amounts to 20-25 percent.

[Question] What are the earnings of those surveyed like? Can those who are employed cover their current needs?

[Answer] Three years ago, 44 percent of the people felt that their incomes were enough to satisfy their needs. This year, however, only 5 percent think that their incomes are sufficient. And 19 percent claim that their incomes are absolutely insufficient. Between those with sufficient and insufficient incomes, 76 percent feel that their incomes are to some extent sufficient to satisfy their current needs. The sufficient and insufficient ones here are a negative indication, and accordingly, 95 percent of the households cannot satisfy their current needs with their current incomes.

[Question] What do those surveyed say about personal incomes? Are they encouraging them to work more and better? Are we becoming accustomed to economizing and increasing efficiency in family spending as well?

[Answer] Inflation is a source of extremely great social problems; on this scale it becomes tragically destructive. The first thing that inflation leads to is uncertainty in earnings. A man can work and slave like a horse, and then the money that he has brought home today is no longer worth as much as it was yesterday, since in the meantime something has become more expensive. And this ruins people's attitude toward work.

As for whether personal incomes encourage people to work, 21 percent answered that they did not encourage them enough, and 41 percent that they did not encourage them at all, since their earnings were not a result of work. Accordingly, a negative indication is given here by a total of 62 percent of the people.

The survey showed that the population is being affected in the first place by food prices, and in the second place by the cost of electricity; clothing and footwear are in third place, and only then comes gasoline. But there is also rent, which is a social matter. And under such conditions, what do people do? Naturally, they have to economize.

They economize most on heating and light, and then on clothing and footwear. As a national average, however, as much as 30 percent of the population has answered that they are cutting back on food (and even 66 percent in Macedonia).

[Question] They say that in the crisis the skilled and valuable people are distinguishing themselves, and increasing their standard of living, but more than this, enlarging their property holdings, "becoming billionaires." Could you tell us how many "billionaires" we have, and who they are?

[Answer] The social differences are so great today, and so much is said and repeated about this, that one no longer has any desire to talk about this. It is a disturbing fact for society that we cannot say who the richest man in Yugoslavia is. In any well organized country, it is known who is richest and who belongs economically to the top stratum. They thus have a mechanism for measuring this wealth, but also for controlling it. But since we do not know this, we are free to say that there are 5,000 of them, but we can likewise say that there are 10,000 of them. We can say whatever we want. I think that this is a real area for social conflicts, but also social manipulations, and both are dangerous to society.

[Question] We see that many people are cutting back on food, and that the crisis is clearly evident. In these circumstances, two aspirations are appearing: to increase the differences in earnings, and even more bitterly, to reduce them. What do those surveyed say?

[Answer] Most people think that the social differences in our country are large, and that they are becoming immeasurably large. In 1961, 38 percent of the Yugoslavs felt that social differences were large, and in 1964 64 percent thought so. As the largest factor in creating social differences, people cite the Law on Prohibited Earnings, what we call acquiring income in a nonsocialist way.

As another factor in excessive social differences, people cite high personal incomes. Thus, under conditions in which objective analyses show that there is a trend toward a balancing in the area of real earnings, even these ranges are beginning to bother people, and this should be seriously taken into consideration.

[Question] There are more and more examples of people not being able to meet their most basic needs, and not being able to pay their current obligations. Is there any optimism, at least, that it will be better tomorrow?

[Answer] We already have the occurrence of poverty and a minimal existence among people who are working. This is no longer any sort of pose; there are people, especially in the cities, who are not able under normal conditions to support their families, and this means that they cannot even pay for rent, electricity, and heat. Someone who lives in the city today and is unskilled, and lives solely on these earnings, cannot maintain the obligations for residence as they have been formulated, for example, in Novi Beograd, Novi Zagreb...

We built our cities for those who came to get an apartment even before they were in the city; we built for a high housing standard. And now, when personal incomes have reached a level more realistic than the one we once had, we are now faced with the problem that all of us together are having a hard time maintaining these economic criteria.

And how are people viewing the future? There is strongly pronounced pessimism. While in 1977, for example, 15 percent of the people in Yugoslavia predicted that their lives would be worse the next year, in 1984, that percentage of pessimists reached 63 percent in comparison with 1977. This pessimism is particularly associated with nonagricultural households, and thus with the working urban population, where expectations that their lives will be worse are even reaching 75 percent. It is my profound conviction that this is an indicator that should be believed, and that should be taken into account in measuring attitudes and in measuring the social situation.

[Question] What do those surveyed say about what they would be satisfied with in the next few crisis years?

[Answer] About 57 percent of the people think that their incomes should be up to 50 percent higher, so that then they could live somehow. About 9 percent of them are seeking incomes 50-75 percent higher; 16 percent of those surveyed are seeking incomes 100 percent higher, and 76 percent, more than that. If inflation is 80 percent, then it is clear that people have reconciled themselves to the present situation of survival, and that the extent of their aspirations at this moment is no more than having their incomes keep pace with inflation. And this again should be analyzed in particular, since if our aspirations as consumers begin to be satisfied if we remain where we are, then this is a very negative phenomenon.

[Question] When the crisis began, the predictions then were not as black as the reality we have experienced. What disrupted all of this, and what, in your opinion, are the main causes of the drastic decline in the standard of living and the increasingly more uncertain society security?

[Answer] The Long-Term Economic Stabilization Program, three years ago, assumed that a decline in the standard of living had to take place. The decline thus did not come as a disaster and a surprise. There were three reasons: the foreign debts and interest that had come due, the extremely high devaluation and the need for us to export more for the same unit of imports, and the fact that citizens' foreign exchange earnings abroad were no longer even close to being an abundant source. That was the objective reality.

The real decline in the standard of living, especially the decline in real personal incomes, was, however, far more intensive than one could have even thought and than was expected in any calculations. And no one could have expected such a long period of time, and no one did. And the worse thing, and the most disturbing, is that it is still not apparent that the unfavorable situation has been stopped.

[Question] Where was the mistake made, and by whom? Did we have to get into this situation?

[Answer] The extent of the disruption that we are carrying from the past is probably larger than was estimated. I personally think that the main cause, the main source of our problems, is an economic system that is not effective enough, that simply fostered and developed a very large number of investments. And if one looks at it a little more closely, it could be said that the main motive for development was investment. Unfortunately, such large investments were inefficient in terms of both income and foreign exchange, while millions of people moved from the villages to the cities, coming with the ambition of living better. These social changes created a large purchasing force that such investments were not able to support. I think that this element was underestimated even in the Long-Term Economic Stabilization Program.

I am deeply convinced that the present situation in the economy and social structure, i.e. in the standard of living as well, cannot be ascribed solely to these objective facts and circumstances. I think that current economic policy contributed a great deal to this situation, and that it is still doing so. In view of the situation in the economy and society, the Long-Term Economic Stabilization Program proceeded from the fact that it was necessary to carry out a certain number of one-time measures in a synchronized manner, and it warned that unsynchronized implementation could cause even more unfavorable consequences. That is written in the program. If anyone does not believe this, he should read it. But the actual tactic in implementing the stabilization program was measure by measure, drawn out over a period of time, not continuous, and often mutually inconsistent.

[Question] Many people say that we did not have realistic economic figures, starting with the inflated income. This is the reason for the motto of the current policy -- restriction of consumption. How objective is all this?

[Answer] The Long-Term Program was clear in the part about what would necessarily have to be restricted, but it was also clear in stating that this period should be shortened as much as possible and that the emphasis should be shifted to encouraging economizing and overcoming problems, and not through restricting consumption. And that has had an unfavorable effect as a tactic, as an approach to policy. That orientation was bad, unjustified, and unfactual.

Now people say that we did not have a real income, i.e. that we consumed the amortization. They cite several factors indicating that we did not have realistic economic figures that were the parameters for consumption. They cite the estimate that we lost $15 billion in unreal amortization. One can even agree with all this, but I must say that at the same time, in personal consumption, $60 billion in foreign funds, that were in this fund for personal consumption that we measure according to the nonsocial product, went into the pockets of the citizens. According to this, the citizens got four times more from abroad than the amortization that we consumed in the national income. Consequently, the question is which consumption was inflated by the unrealistic national income?

[Question] Is the answer known?

[Answer] I do not know the theoretical analyses and parameters and I have not heard of anyone doing them, ones that would objectivize the relationships of capital formation and consumption, and investments and consumption. I can present only two facts: when the problems began to occur, in 1980, Yugoslavia was in 30th place among 125 countries in terms of social product. In investments it was then in 5th place, and in general consumption, which we say was very high, it was in 30th place, i.e. in the same place as for income. But in terms of the rate of personal consumption we were only 102nd place. Among 66 oil importing countries Yugoslavia was then in 10th place in terms of social product, in 6th place in terms of investments, and in 12th place in terms of general consumption.

If someone spent too much, then it was the investments, which were beyond any realistic material capabilities, which even in the circumstances of relatively favorable living conditions depressed consumption and the standard of living and allowed consumption to increase more or less by the same extent as social changes occurred and buying power increased, and by the same extent as buying power abroad, but that of citizens, not the one for which we went into debt.

[Question] The realistic interest rate and realistic foreign exchange rate decided upon by the Long-Term Economic Stabilization Program have divided both economists and politicians. Who is right?

[Answer] The Long-Term Economic Stabilization Program was clear, and in regard to both interest rates and the exchange rate, there is no dispute about the need for them to be realistic. What is disputed is the way in which this has been applied.

Under conditions in which the economy was overindebted, and did not have any resources of its own, and under conditions in which inflation had already reached 30-40 percent, it is completely clear that interest was acting as a new input generating inflation. The road to realistic interest rates was the road to financial consolidation: rescheduling, several synchronized actions, and more moderate inflation in which this could be maintained.

The program clearly states that one should treat as a realistic exchange rate the difference between domestic and world inflation, or inflation in which we are primarily exporters, but no more than this.

It can be seen from many circumstances that these two elements have more or less independently become the framework of current economic policy, but it cannot be said that this was good and in the spirit of the economic stabilization program.

[Question] You are completely leaving out the external factor, our obligations to our creditors and the IMF?

[Answer] I have already said that we had to aim at appropriate restrictions in the area of consumption. International circumstances -- the suggestion of tightening one's belt in order to send profits to those who loaned the capital and who shifted the entire risk to those who were the main users of this capital -- only strengthened this domestic orientation. This orientation lasted too long, and I even think that a conceptual approach to development is being created which is continually offering slower growth in joint consumption than in the social product, slower this, slower that. There is no such economic-reproduction law, except that we projected such a development policy and carried it out.

[Question] We know how things are for us. Tell us what we should do in order to improve things, to halt the crisis.

[Answer] No one has offered a better prescription than the Long-Term Economic Stabilization Program. It is still valid, but today it has to be adjusted to real relations. If we simply transferred everything done previously to a quite different situation, we would be making a mistake again. The step by step policy has never yielded results, and it has even stimulated the difficulties that we have. The argument used in defense of this tactic -- that the blow to the standard of living would be too great if all the measures were applied at once -- did not prove to be valid. During the period to date the blow was great, and we lost a great deal of time, without hitting the right target.

The main and central question today is whether we will get moving in the struggle against inflation, in the struggle for some kind of dignity for the dinar. In my opinion, this one-time act, which was advocated by the Long-Term Program as a momentary change in these relations, is inevitable. Appropriate price relations would have to be established, since this approach of changing things bit by bit, with the determination that all prices will increase, and that price parities will improve in this growth, only stimulates prices to run wild, the inflation that is of least benefit, for instance, to energy and agriculture.

We should thus start with one level and parity of prices, economically justified, and which we can maintain at this time, and one balanced exchange rate for the dinar. This should also be followed by a redistribution which would improve the relative position of the economy and inter-branch relations. These initial things, which should be done along with the financial consolidation measures, would offer a realistic basis for us to be able to do something at last. Another direction would be systemic changes, which would lead to a better general situation, and which could then provide better economic results. Only then could we take strategic steps in development policy, and the 5-year plan would select the goals but also the means to achieve them.

[Question] Surveys of the population in our country are not continuous; not much significance is ascribed to them, and few decisions are made on the basis of the views and attitudes of the population in the broadest sense. How reliable is this research on social position?

[Answer] I think that one should not believe people's answers 100 percent; each of us determines how he perceives and experiences his subjective situation. But one should also not ignore this information, which is vital for policy.

ECONOMIST BAJT DISCUSSES MISCONCEPTIONS ABOUT INFLATION

Belgrade EKONOMSKA POLITIKA in Serbo-Croatian 16 Dec 85 pp 25-27

[Article by Aleksander Bajt: "Why Not 0 Percent"]

[Text] Recently, the idea that inflation would be reduced most quickly and thoroughly by reducing interest rates has been disseminated more and more widely again. According to some articles, the rate of inflation could be reduced by one half in 1986 by cutting the present interest rates in half. In practice, this would be achieved by projecting inflation to be half of what it currently is, and tying interest rates to the projected inflation; this, with the assistance of direct price controls during the first half of the year, would make it possible to keep inflation at the rate thus cut in half during the second half of the year as well.

This is pure nonsense, a consequence of ignorance of the ABC's of political economy, either Marxist or bourgeois -- it is all the same. More precisely, it has to do with being incapable of even the simplest logical thought and deduction. In this article, I will show that a negative interest rate, especially an increase in it, not only does not reduce inflation, but also inevitably increases it. In fact, the negative interest rates after 1981 are mainly responsible for the inflation, and along with it, the general inefficiency of our economy, together with all of the consequences, such as the rarity of financing one's own investments, the great dependence of the economy upon the banks, the negligible pooling of funds, and the low mobility of capital in general. Planning a reduction of interest rates in 1986, i.e. an increase in their real negativeness, can be directly equated to planning greater inflation and an even less efficient economy.

To start with, here are one question and one fact, both of which illustrate the thesis of an incapability of the most elementary thinking. The question is as follows: if inflation is cut in half by cutting interest rates in half, why wouldn't it be completely eliminated from our economy by reducing interest rates to 0 percent in the same way? Why do the authors of the salutary medicine stop halfway? Or perhaps they know the reasons why bringing down interest rates affects only half of the inflation, and has no effect on the other half?

The information that will help us is from accounting. Specifically, the idea that the present high nominal interest rates are a cause of inflation is derived from a quite elementary mistake in our system of accounting. It considers the part of the interest that represents valorization of credits to be an expense. Only the part of the interest rate that exceeds the rate of inflation, however, can be considered an expense, and this is only an expense-income of the primary factor that is covered from income. For the most expensive part of our credits this is 1 percent, and for all of the credits of the banks (in 1984) it is exactly MINUS 43.3 percent! Could anyone, not to mention an economist, believe that an interest rate of 1 percent, or minus 43.3 percent, which it averages out to, is raising prices?

Since the part of the interest rate that is equal to the rate of inflation can be reduced to valorization of the credits, opposition to "real interest rates" is equivalent to a demand that in real terms the debtors only repay part of the debts, and leave the other part, which with high inflation is the main one, to the creditor, and in the final analysis to society as a whole. The adoption of this demand would mean an end to the very foundations of the legal system; no economy can be organized with such a system, far less a socialist one (with the ambition of instituting distribution according to labor). The discussions of the economic system are becoming completely absurd. Once we accepted such a system, then it would be much more logical for us to allow only part of the price of goods (to which repaying only part of the debt can be reduced) to be paid by investors and consumers buying them with their own funds and not other peoples' (credits). This is absurd, but no matter how absurd it is, it is less so than the demand that only part of the debts (the minor part) be repaid.

Before I go on to prove that negative interest rates inevitably cause inflation, I must disassociate myself from the widespread view that the excessive burden on the economy represented by contributions for the social superstructure is one of the factors responsible for inflation. Although great reserves are actually concealed in the social superstructure, and although the political sphere, as the initiator of the growth of this superstructure, should find the correct place for its activity there, we will not deal with this. High contributions and the services financed by them, to a considerable extent nonproductive ones, are one form of the general inefficiency of our economy. Because of them, the standard of living of our workers in material and nonmaterial production is lower than it could be. Nevertheless, if these contributions are not increased, or rather if they do not grow faster than the growth of the disposable social product (the domestic product minus the positive balance of the balance of trade), they do not cause inflation. Even very inefficient economies can be stable.

New Money

Here I am coming to the main part of the work. The economy is not just complaining about large contributions for the social superstructure, but also about large debts. At every point, however, in the past and in the present, the economy has had the possibility of financing investments with its own savings, and avoiding becoming dependent upon the banks. If an individual enterprise has not been capable of saving enough funds to finance investments, it has been able to do so by pooling funds together with other enterprises, either directly or through the banking system. Naturally, in this case it is a joint investment and not one's own. Since the economy did not do this, since as a whole, in general, it has obtained credits and thus had available less and less of its own funds and has become more and more dependent upon the banks, this can serve as a proof that the predominant financing of investments with bank funds, the possession of less and less of one's own funds, and increasingly greater dependence upon the banking system are not only the result of the economy's own decisions, but also of the decisions by which it improved its own position in comparison with financing investments with its own funds. Naturally, since the funds that it obtained from the banking system were not derived from its own savings (or the public's), since they constituted new money, they directly caused inflation by increasing demand.

The improvement in the economy's position achieved by financing investments with new money was not small. It was equal to the difference between the rate of the time preference of workers (the rate that equates the size of the increase in income in the future resulting from the investment to the loss of income in the present -- because of the investment) and the interest rate that the economy pays for credits. Because of the uncertainty of the future income, due to both the low effectiveness of investments and the impossibility in practice of individual appropriations of the products of the investment, the rate of the time preference must be very high -- that is, whatever the interest rate for credits, the advantage achieved by financing investments with new money instead of one's own savings is extremely high.

Unfortunately (and this is something that our economic policy has never been able to comprehend), the advantage to the economy achieved by financing investments with new money instead of one's own savings is only an advantage from the standpoint of the individual enterprise. Specifically, it is only from this standpoint that one can assume that prices will remain unchanged when investments are financed with new money. Since that method of financing became universal, and since it was used by more or less all investors, the necessary consequence of the massive emission of money was an increase in prices. The increase in personal incomes made possible by financing investments with new money instead of one's savings -- and that is the purpose of using credits instead of one's own savings -- remained nominal. The increase in prices, inflation, really reduced it to zero. In spite of the nominal increase made possible by the credits, real personal incomes remained what they would have been if the economy had saved up all the investment funds itself. The only difference would be the stability of prices, i.e., the absence of inflation.

By making it possible for the economy to improve its position by using emission credits for financing instead of its own savings -- even though it is obvious that the possibility of improvement only exists on an individual basis and does not exist for the economy as a whole -- economic policy failed to perform its basic duty, preventing individual illusions with disastrous social consequences. It is responsible for the occurrence of inflation in our economy, and not the economy, which under the given conditions, i.e. the possibility of obtaining emission credits, in an individual sense acted quite rationally. The calls for the economy to behave in a noninflationary manner, which are very characteristic of political forums, are nonsensical as long as it is offered the opportunity to improve its position, of course only in an individual illusion, by obtaining emission credits.

Equilibrium Interest

If the banking system, and in the final analysis the National Bank, did not create new money and offer it to the economy, it would have to finance its investments with its own accumulation -- savings. If the economy, including the population, were capable of saving the funds necessary to finance investments, the investors would have to pay the savers enough interest to compensate for their preference of current personal incomes, as opposed to (uncertain, especially in the individual sense) future ones. We call it the equilibrium interest rate. If income from interest were primarily put into investments (in the form of past labor, it must also partially increase personal incomes), the criticism regarding the social unacceptability of such a system would be eliminated. In any case, it would directly increase the effectiveness of business operation. if the savers obtained equilibrium interest by depositing their funds in banks, it would not occur to them to invest them themselves, unless they were able to ensure a higher yield than the interest that they get from the bank by depositing their savings, without great risk. This means that the equilibrium interest rate would serve investors as a minimum of profitability. This would increase the supply of savings/deposits and increase its mobility.

On the other hand, the investors would try to save as much of the funds as possible themselves, individually and by association, while financing only the smaller portion by obtaining credits. This means that the macro ex ante equivalence of savings and investments would for the most part be ensured at the micro level. The credit that the investors would use to finance investments would be derived from the enterprises that are not yet investing, and not from new money. Thus, on the whole, the equivalence ex ante of savings and investments at the macro level would be ensured. The economy would receive income that was equal to the amount (value) of the product produced, actually the income paid for the product produced, and this would make possible its realization at unchanged prices, i.e. without inflation. I will not go here into the problems that arise because of temporal discrepancies between the savings by one part of the economy and their expenditure by another part.

This makes two conclusions possible. In the first place, since greater efficiency increases the social product, and accelerates growth with equal funds invested, personal incomes would be greater than in an economy with sub-equilibrium interest, i.e. with inflation. My previous observation that the only consequence of financing investments with one's own savings would be the stability of prices, i.e. personal incomes (and the social product) equal to those in an inflationary economy is limited to the static aspect of the problem. Dynamically, when one takes increased efficiency into account, financing investments with one's own funds, which makes possible an equilibrium interest rate, increases the social product and personal incomes.

In the second place, the formulation that the stability of the economy can be ensured by the ex ante equality of savings with investments, and of the latter with equilibrium interest, could elicit criticism. Specifically, in the past I stressed personal incomes as a source of inflation. It is easy to prove, however, that these are different formulations of the same condition. If the condition of the ex ante equality of savings and investments is met, personal incomes (consumption) cannot be larger than the social product reduced by investments. This means that the condition of the stability of the economy can also be expressed in the opposite direction: ex ante, i.e. the nominal personal incomes paid per unit of product must not be increased. If this condition is met, then what is left after the payment of personal incomes (consumption), and this is nominal savings, is equal to the unspent, i.e. invested, portion of the social product. This means that an economy that even ex ante saves as much as it invests (the first formulation), or which does not increase personal incomes per unit of product (the second formulation) is by definition stable, and noninflationary. Equilibrium interest rates that ensure that the above condition is met thus ensure stability and prevent inflation.

We thus obtain an answer to the question concerning the cause of our inflation (and any inflation). In any economy that is not capable of ex ante saving as much as it invests, or alternatively, ex ante ensuring the constancy of nominal personal incomes per unit of product, investments are greater than savings. Alternatively, nominal personal incomes per unit of product increase. This inevitably means inflation and with it the reduction of all incomes in real terms, by the rate of inflation, i.e. forced ex post savings. Because of an interest rate lower than the equilibrium one, our economy was never capable of ex ante saving as much as it invested. It has always compensated for ex ante savings by the creation of emission money. Inflation is a natural consequence of such a policy. In other words, inflation did not come to our economy by accident, but rather as a result of conscious economic policy. In fact, economic policy is the sole essence of it. If economic policy were not aware of this, this would have to be taken as proof of ignorance of the elements of economics.

The criticism could be raised that inflation was also influenced by other causes, above all by external prices in 1974 and 1979-80, as well as the decline in the disposable product below the level required for halting indebtedness abroad and making the economy able to pay interest on foreign debt regularly. All of this is true, but the domestic product is by far the major factor in inflation. Otherwise, inflation in Yugoslavia would be similar to inflation in Western countries.

This makes possible an evaluation of the current ideas that inflation can be reduced by reducing interest rates. Instead of a reduction, it must lead to a further acceleration of inflation. In fact, the policy of reducing interest rates directly is a policy of further destabilization of the economy, a systematic surplus of investments over ex ante savings, i.e. personal incomes nominally larger than the product for which they are paid, and a further nominal expenditure of what has not been produced. Since financing at below-equilibrium interest makes business operation worse, this policy is also a policy of a further deterioration in the quality of business, a further reduction in efficiency, and economic growth slower than is possible, and as such contrary to the interests of workers and the population.

I will not dwell here on the possible criticism that with such a method of capital formation we would never be able to invest as much as we have invested. It will be sufficient for me to say that with greater efficiency this would not even be necessary, and that the same growth could be achieved with incomparably lower investments, which means incomparably larger personal incomes and consumption. Today our economy is naturally diversifed and dynamic enough to be able (together with the population) to accumulate enough for effective investments. There is no doubt that useful assistance could be offered by suitable systems, adopted by agreement, for the distribution of income and the formation of personal incomes.

Who Is Responsible

Two questions remain to be answered. In the first place, when we know that the economy needs not only really positive interest rates but also equilibrium ones, what is the optimum method for introducting them into the economy? There are two mistaken opinions. According to the first, the introduction should be gradual. According to the second, it would first be necessary to implement systemic changes, and when the new system got under way, the time would come for introducing "real" interest. The first opinion is similar to the demand that the heavy bleeding of a seriously wounded person be stopped gradually, obviously leading to his bleeding to death. The second opinion forgets that the economic system of a self-managing economy is a market, an equilibrium of the prices of factors and products. Without this any economic system, current or new, or any other ones, cannot ensure effective business operation by associated labor.

Just as the efficiency of foreign trade is determined by the realism of the exchange rates for foreign exchange, and the efficiency of labor by the realism of personal incomes (their connection with the real product), the efficiency of investment and of business in general on the macroeconomic level is determined by the realism (equilibrium) of the interest rate. An economic system can fulfill its task only if it contributes to the mobility of the market and eliminates its defects (for example, the indivisibility of factors, the contrasts of private and social product, and the occurrence of unearned incomes). If it enters into a conflict with the market, and wants to organize the economy with nonequilibrium interest rates, for instance, the system becomes a cause of general inefficiency. This means that the choice made de facto by the Federal Executive Council in the implementation of the Long-Term Economic Stabilization Program between the prices of the factors and the system was correct. The only mistake is that under pressure from political forces, and because of their unwillingness for real changes, and the ineffectiveness of the discussions of the system, it was not able to be more decisive in the right direction.

In the second place, how is it even possible that the ideas about reducing inflation by reducing interest rates -- which defy any economic logic and which, if implemented, will cause high inflation and an even more inefficient economy -- are not only occurring among us, but also gaining support from political factors, such strong support that the Resolution for 1986 as a whole is contaminated with them? One is thus quite justified in calling it the Resolution of the further instability and deterioration of business activity in 1986.

The general answer (I hope, since I do not want to investigate other possible motives) is ignorance. Of course, ignorance is not an excuse. More precisely, no one can be held responsible for his ignorance, not even accepting work that he is not qualified for. Nothing would be achieved by pointing to the political system that makes all of this possible. Responsibility is always the responsibility of physical persons. Physical persons select the experts, and decide whether to accept their proposals and support them. This, it seems, is the main problem in determining policy for next year, as well as for its results in the past.

EFFECTIVENESS OF AID TO UNDERDEVELOPED AREAS QUESTIONED

Ljubljana DELO in Slovene 12 Oct 85 p 15

[Article by Boris Jez: A System of You Give-I Receive Without Any Real Benefits]

[Text] In the postwar years, we have lived under the illusion that it is possible to remove or at least greatly ameliorate major differences in the economic development of the federal entities in a single 5-year period. These differences, however, have not only remained, but are increasingly becoming one of the most important economic and political problems of present-day Yugoslavia. This is in spite of the fact that our country is almost certainly the foremost in the world regarding the amount of resources allocated for the faster development of the less-developed areas, in proportion to its economic strength. What is wrong with our regional policies at the federal level; why is it that, in spite of so many investments, we have not been successful in getting the economic wheels to move more quickly in these federal entities?

The debate concerning this, which in reality has never ceased, has these days reached one of its high points in the Federal Assembly's committee dealing with the question of the economically underdeveloped republics and the Federal Autonomous Province of Kosovo. Namely, the committee is to formulate four laws, which would in the next 5-year period determine the circle of those who take for granted assistance from the broader social community, and also the form for this assistance. The sticking point is the question of which federal entities in reality are so far behind economically that they are not capable of development without financial assistance from others. Some feel that in fact only Kosovo is entitled to the status of an underdeveloped federal entity, while others maintain that Macedonia, Montenegro, and Bosnia and Hercegovina should remain in that "club." Such a divergence in positions is most frequently explained by the fact that we lack objective criteria for establishing (the lack of) development, which is not completely true.

It is certain that the Federal Assembly already passed a set of such measures 9 years ago and that things have been at an impasse for a long time, because when the measures were being formulated, each institution "saw" primarily its own republic or province. Last year, however, the Federal Institute for Social Planning brought up for discussion criteria that everybody felt constituted a satisfactory basis for seeking a common language. Montenegro, however, immediately noted that, according to these criteria, indicators, and evaluations, it would be dropped from the circle of economically underdeveloped federal entities, and it wanted to add another criterion of its own. Macedonia, which under the proposed criteria found itself on the verge of development, acted in a like manner.

In short, it was demonstrated once again that in Yugoslavia it was in fact impossible to come up with objective criteria for establishing (the lack of) development, and that in this area economic science was overshadowed by politics. In the current medium-term period, the circle of those that are economically underdeveloped has been agreed upon politically, and so one should not have any illusions that this will not be the case during the next 5 years. A certain amount of selfishness on the part of those who are underdeveloped and who would like to be supported by the work of others is certainly not the only thing to blame. Above all, this is due to the fact that the transition to the status of being developed would certainly be very painful, and so they feel most secure if they get their dinars on a regular basis from the fund of the federation. Thus far, economic policies have not really offered them anything specific in exchange for their current position, except for the so-called "transitional period" regarding which it is not even known how it would turn out in practice. It seems that in the country's medium-term plan, the wisest thing to do would be to establish how the borrowing, fiscal, and tariff policies are each to solve the problems of these federal entities. At the same time, it is necessary to state that Kosovo in particular is to get major tariff and credit relief. If we were to sum up all the provisions of the current policy, it would be easy to demonstrate that the province is receiving more money in this way than through the fund of the federaiton. At any rate, it should be made possible for the federal entities, during the transitional period, to move away from their current status as painlessly as possible, and it would certainly be possible to reach an agreement in the Federal Assembly more quickly if that were the case.

As a matter of fact, this has brought us to the essence of the problem: For many years, the seeking of objective criteria has led to a dead end. The federal Executive Council has not taken advantage of the moment for establishing a new, contemporary system and instruments for regional policies. The fund of the federation is the last remnant from a not-so-distant period of our economic history, and it has many etatist attributes. For that reason, we should replace it with something more suited to our time. Obligations that remain to be transacted could easily be taken over by the federal budget, and the idea of converting the fund into a kind of bank that would operate in accordance with businesslike criteria seems even more acceptable. The principle should prevail that the greatest opportunities for the underdeveloped lie in the unification of the economy in a unified Yugoslav market ruled by economic laws. In this medium-term period we will certainly not satisfy the request to have half of the aid to the underdeveloped take the form of direct association of work organizations. In spite of that, we must persevere, so that in the upcoming 5 years the share would be at least seven-tenths, as was proposed in the draft law.

It is possible to encourage association with the most diverse instruments of economic policy; practice has demonsrated that the mechanical transfer of funds from the North to the South is virtually the least effective instrument, which has frequently shown itself to be economically harmful as well. Federal entities that are receiving assistance from the broader social community are investing the money that they receive exclusively in accordance with their own "tastes," which in practice means a purposeless allocation of resources in the Yugoslav economic sphere. For example, this is evidenced by duplication of capacity and capital-intensive investments, while at the present time these republics and Kosovo need, like parched earth needs rain, jobs more than anything else, etc. Furthermore, the underdeveloped do not, as a rule, allow "interference" in how this money is to be spent, which of course defies all economic logic, since those who are investing should at least participate in all decisionmaking that affects joint investments.

Directly linked to this question is the problem of the amount of funds that the Yugoslav community is to allocate in the next 5 years for encouraging development in the economically underdeveloped republics and Kosovo. The draft law envisages having the economy give for this purpose, in the upcoming years, 1.58 percent of the social product instead of the previous 1.83 percent, which is something that the "club" of the underdeveloped naturally does not agree with. As a matter of fact, even the current amount allocated from the social product does not ensure that the major problems faced especially by Macedonia and Montenegro, in addition to Kosovo, will be solved. On the other hand, it is of course not possible to overlook the major problems of the more developed territorial entities, which are now objectivley able to give less if they do not wish to jeopardize their own development. The extent of this problem was especially well illustrated at the most recent sessions of the Federal Assembly, at which the delegates from Serbia minus the provinces demanded that Serbia should contribute half as much as the others for the underdeveloped entities, because Serbia itself has 51 opstinas that are far below the Yugoslav average.

Many cannot agree with Serbia's request, which certainly has a logic of its own, because it would create a precedent that would gradually bring about a disintegration of the current, albeit not exactly successful, system of providing assistance to the underdeveloped. At any rate, it should be noted that these problems would certainly not appear in such a politically acrimonious form if they followed a differently formulated regional policy, as for example that contained in the stabilization program. Right now, the republics and the provinces are literally forced not to agree with each other, but rather to haggle with each other, since each dinar has become quite precious. These tiring negotiations, which will certainly once again continue to the last day of this year, have pushed into the background the essential point: how to make possible a faster solution for the country's less developed areas, without at the same time placing an excessive burden on the economic locomotives that are pulling our development.

Similar statements are valid regarding the so-called supplementary resources which are every year earmarked by the federal treasury for financing joint and common expenses in the underdeveloped republics and Kosovo. The problem seems to be unsolvable, because the less developed areas are quick to invoke their legal rights, while others try in vain to argue that they have no money even for themselves. For example, this year it was planned that Kosovo would receive approximately 26 billion dinars from the federal treasury, which was equal to this year's Slovenian budget. Things will continue in this manner, however, as long as it is possible to dip into the common pot. Instead, we should link consumption to work results and solve the problems of the underdeveloped territorial units through a closer inter-republic cooperation in the areas of science, culture, education, etc.

Regardless of the agreement that is reached in the federal assembly regarding the four draft laws, Yugoslavia will clearly retain the current system and instruments for assisting the underdeveloped areas in the next medium-range period. It is a pity that in the atmosphere of convincing each other that it is necessary to begin acting differently, we are preserving the system of "you give-I receive," which has not only failed to yield expected results, but has even been harmful in many instances. Everybody is receiving resources, both those who use them quite well and those who immediately stuff them into pay envelopes.

Of course, it would be impossible to come up with anything qualitatively new by the end of the year that would be based not only on the principles of socialist solidarity, but also on economic expediency at the same time. For that reason, we should not once again waste the next 5 years in a stubborn search for some objective criteria which, in the final analysis, are only criteria for dividing things up and not for creating new wealth. We should utilize them eventually to establish a new, more contemporary system of instruments for regional policies. Such a system will in fact be able to inspire us once again to convince each other that it is possible to remove (excessively) large differences in economic development in a single 5-year period.

DECREE ON ORGANIZING UNIFIED FOREIGN EXCHANGE MARKET

Belgrade SLUZBENI LIST SFRJ in Serbo-Croatian 30 Dec 85 pp 2077-2080

[Text] 898. On the basis of article 26 paragraph 2 of the Law on Foreign Exchange Transactions (SLUZBENI LIST SFRJ no. 66/85), at the proposal of the National Bank of Yugoslavia, the Federal Executive Council is adopting a

Decree on the Organization and Operation of the Unified Foreign Exchange Market

I. General Provisions

Article 1.

The purchase and sale of foreign exchange, in accordance with this decree, take place:

1) in direct contacts between banks authorized for foreign business which have current accounts in banks abroad (hereinafter "authorized banks");

2) at a specially organized interbank meeting of the authorized banks, or of the authorized banks and the National Bank of Yugoslavia (hereinafter "interbank meeting").

Article 2.

Foreign exchange is purchased and sold immediately or on terms.

Immediate transactions involving the purchase and sale of foreign exchange are conducted by the authorized banks and the National Bank of Yugoslavia.

Foreign exchange is purchased and sold on terms by the authorized banks.

Article 3.

The immediate purchase and sale of foreign exchange, and the purchase and sale of foreign exchange on terms, are engaged in by the authorized banks:

1) in direct contacts between the authorized banks;

2) at an interbank meeting.

The purchase and sale of foreign exchange on the unified foreign exchange market is confirmed by a sales agreement, a form for which is printed along with this decree as an integral part of it.

Article 4.

The authorized banks buy and sell foreign exchange in accordance with the requirements of their operation, and in accordance with their own daily foreign exchange position and the joint one.

The authorized banks buy and sell foreign exchange among each other only for payments abroad that come due within a period of 2 working days from the day of the purchase and sale of the foreign exchange.

Article 5.

An authorized bank for which the inspector of the National Bank of Yugoslavia, in accordance with the provisions of article 145 of the Law on Foreign Exchange Transactions, has halted payments abroad, buys and sells foreign exchange on the foreign exchange market only for paying mature foreign credit obligations and convention obligations.

Article 6.

The object of the purchase and sale, in accordance with the provisions of this decree, is the foreign exchange designated by the National Bank of Yugoslavia in accordance with article 30 of the Law on Foreign Exchange Transactions.

The purchase and sale of foreign exchange between authorized banks is done by transferring the foreign exchange from the account of the seller to the account of the purchasing bank.

The authorized bank buying the foreign exchange is obligated to pay the dinar equivalent value of the foreign exchange bought, within the period agreed upon, to the transfer account of the bank selling it.

If, when the transaction is agreed upon, the date for completing the transaction is not explicitly agreed upon, the transaction of the purchase and sale of the foreign exchange is completed at the latest within a period of 2 working days from the date when the transaction is agreed upon.

Article 7.

In order to coordinate payments abroad for all purposes with foreign exchange receipts and the purchase of foreign exchange, in accordance with this decree, the authorized banks establish plans for the receipt and outflow of foreign exchange and the daily foreign exchange position, which they deliver to the National Bank of Yugoslavia.

On the basis of the plans for the receipt and outflow of the foreign exchange of the authorized banks, under article 63 of the Law on Foreign Exchange Transactions, the National Bank of Yugoslavia examines the liquidity of the banks, on an individual basis and in general, and if it determines that disruptions may occur, it informs the Federal Executive Council of this.

Article 8.

The authorized banks are responsible for providing the National Bank of Yugoslavia with a summary of the obligations for current payments abroad that come due, seven days before the day on which the obligations come due, for individual orders whose amounts exceed $10 million.

Article 9.

In addition to the plans for the receipt and outflow of foreign exchange, the authorized bank sends the National Bank of Yugoslavia and the national banks of the republics or the national banks of the autonomous provinces a "Summary of the Obligations for the Payment of Principal and Obligations for the Payment of Interest on Foreign Credits" by the 15th of the month for payments coming due during the following month, following Form no. 1, which is printed along with this decree and constitutes an integral part of it.

Article 10.

The authorized bank determines its daily foreign exchange position for each interbank meeting and sends it to the National Bank of Yugoslavia one day before the holding of the interbank meeting, by 12:00 at the latest.

The daily foreign exchange position is determined using form no. 2, "Foreign Exchange Position of the Authorized Banks," which is printed along with this decree and constitutes an integral part of it.

Article 11.

The foreign exchange position of the authorized bank covers the daily state of the foreign exchange funds on the day when the position is sent to the National Bank of Yugoslavia, the foreign exchange receipts expected during the time in which foreign exchange is bought and sold in accordance with the daily position, and the outflow of foreign exchange for payments abroad that come due during that period.

The state of the foreign exchange funds in paragraph 1 of this article covers funds in actual foreign money, checks, letters of credit, papers of value, funds in the current accounts of the authorized bank abroad, foreign exchange deposited for a fixed or undetermined time in accounts with foreign banks, and foreign exchange funds in the accounts abroad of other banks, for which this bank has paid the dinar equivalent value in accordance with article 86 of the Law on Foreign Exchange Transactions.

Article 12.

Payments abroad that come due on the day for which foreign exchange is bought and sold at the interbank meeting cover all obligations resulting from the payment orders of organizations of associated labor and other social juridical persons, and are included in Form no. 3, "Summary of Due Obligations for Payments Abroad on the Day ___ 198_," which is printed along with this decree and constitutes an integral part of it.

Article 13.

On the basis of the data from the daily foreign exchange positions of the authorized banks, the National Bank of Yugoslavia compiles the joint foreign exchange position of the SFRY, in order to establish the overall supply and demand for foreign exchange among the banks in direct contacts and at the interbank meeting, and sends it to the interbank meeting.

Article 14.

An authorized bank that does not send its foreign exchange position on time, per article 10, and the summary of its foreign exchange obligations abroad, per article 12 of this decree, cannot participate in the work of the interbank meeting on that day and cannot make current payments abroad until it sends them.

An authorized bank can purchase foreign exchange in direct contacts and at the interbank meeting if it maintains the level of short-term debt established by the projection for Yugoslavia's balance of payments for the current year, and in accordance with the decision in article 20 of the Law on Foreign Credit Relations.

II. Purchase and Sale of Foreign Exchange in Direct Contacts Between Authorized Banks

Article 15.

The authorized banks purchase foreign exchange and sell it to each other at the exchange rate established at the interbank meeting.

Article 16.

The authorized bank selling the foreign exchange notifies the professional service of the interbank meeting, on the same day, of each sale and purchase of foreign exchange agreed upon.

Article 17.

After each interbank meeting, the professional service of the interbank meeting must inform all the banks of the state of the coordination of supply and demand for foreign exchange.

Article 18.

The authorized banks are responsible for keeping records of foreign exchange purchase and sale transactions agreed upon in direct contacts with other banks. Each foreign exchange purchase or sale transaction is entered in the records.

Article 19.

The authorized bank making the sale is responsible for issuing, on the same day that it agrees to the transaction of selling foreign exchange to another authorized bank, a sales agreement, in three copies, one of which is kept by the seller, the second of which is sent to the purchasing bank, and the third of which is sent to the professional service of the interbank meeting.

Article 20.

The professional service of the interbank meeting, on each working day, sends the National Bank of Yugoslavia a report on the foreign exchange purchase and sale transactions concluded under article 17 of this decree.

Article 21.

Foreign exchange is bought and sold on terms at the exchange rates agreed upon by the contracting parties, with the stipulation that an exchange rate can only be contracted for within the limits of the exchange rates established by the Federal Executive Council.

Article 22.

Three copies of the authorized bank's signed sales agreements are sent to the person who chaired the interbank meeting for verification and entry in the registry of term transactions. After verification and entry in the registry, one copy each of the verified sales agreement is sent to each contracting party, and the third copy is kept by the professional service of the interbank meeting for its records.

Article 23.

Foreign exchange is bought and sold on terms between authorized banks through the transfer of the foreign exchange from the account of the selling bank to the account of the purchasing bank, under the conditions agreed upon and within the periods specified in the verified and registered sales agreement.

The authorized bank purchasing foreign exchange on terms is responsible for paying, within the periods and at the exchange rates agreed upon in the sales agreement, the dinar equivalent value of the foreign exchange purchased to the transfer account of the authorized bank selling it.

The authorized bank which is the buyer uses the foreign exchange purchased on terms to fulfill the orders for payments abroad of the organizations of associated labor for which the foreign exchange is purchased, in accordance with the sales agreement.

Article 24.

During the application of articles 24 and 110 of the Law on Foreign Exchange Transactions, the authorized banks cannot conclude deals for the purchase and sale of foreign exchange on terms.

III. Interbank Meeting

Article 25.

The interbank meeting is held every working day at a time designated by the Business Council of the interbank meeting, with the agreement of the National Bank of Yugoslavia.

The authorized banks are members of the interbank meeting of the foreign exchange market. The National Bank of Yugoslavia also participates in the interbank meeting of the foreign exchange market.

An authorized bank which has lost its authorization to conduct the business of payment turnover and credit business abroad also loses its right to membership in the interbank meeting.

Article 26.

The members of the interbank meeting establish the way in which funds are to be secured for the work of the interbank meeting, conduct administrative-professional and other work for the needs of the interbank meeting, and can regulate their work more closely at the interbank meeting.

The members of the interbank meeting establish a business council as a joint body, and determine its composition and selection.

The members of the interbank meeting arrange the method of work during the meetings through regulations for the conduct of meetings.

Article 27.

Administrative-professional and other work for the needs of the unified foreign exchange market is performed by the professional service of the interbank meeting.

The members of the interbank meeting can entrust the performance of the work of the professional service, per paragraph 1 of this article, to an organization or community that is equipped to perform such work.

Article 28.

At the interbank meeting, foreign exchange can be purchased and sold in the amounts established by the business council of the interbank meeting.

Article 29.

The authorized banks and the National Bank of Yugoslavia participate in the interbank meeting through their authorized representatives.

The number of representatives of authorized banks who participate in the work of the interbank meeting is established by the regulations on the conduct of the interbank meeting.

Article 30.

The interbank meeting is chaired by a person designated by the business council of the interbank meeting.

At the interbank meeting, the representatives of the members of the interbank meeting submit, in written form, their summaries of the amounts of foreign exchange by type that they intend to buy or sell at the meeting of the day in question. This summary should be consistent with the data included in the daily foreign exchange position per article 10 of this decree.

The supply and demand for foreign exchange are expressed in U.S. dollars, and the purchase and sale of foreign exchange is contracted for in the available currencies.

At the interbank meeting, the National Bank of Yugoslavia submits a list of the intervention exchange rates of the National Bank of Yugoslavia.

Before the interbank meeting begins its work, the National Bank of Yugoslavia sends the competent service of the interbank meeting an aggregate foreign exchange position for all the banks that are members of the interbank meeting. On the basis of a review, by banks and purposes, of the total intentions announced regarding the purchase and sale of foreign exchange, the authorized person chairing the interbank meeting, with the agreement of the representative of the National Bank of Yugoslavia, proposes a means of equalizing the total supply and demand for foreign exchange.

On the basis of the review in paragraph 4 of this article, foreign exchange is bought and sold at the interbank meeting and in direct contacts between authorized banks.

Foreign exchange is bought and sold at the interbank meeting at exchange rates within the range between the lower and upper exchange rates from the list of the intervention exchange rates of the National Bank of Yugoslavia.

Article 31.

Sales agreements for deals concluded for the purchase and sale of foreign exchange are prepared during the interbank meeting, on the basis of the concluded deals entered in the registry of foreign exchange purchase and sale transactions. The sales agreements bear the corresponding sequential number from the registry.

Immediately after the conclusion of the interbank meeting, the sales agreements are presented for the signature of the representatives of the buyers and sellers, who sign them. The signed sales agreements are presented to the authorized representatives of the buyer and seller immediately after the signing. One copy of the signed sales agreement remains in the archives of the interbank meeting.

Article 32.

After the conclusion of the interbank meeting, work begins on calculating the average (daily) exchange rates for all the types of foreign exchange that were involved in purchases and sales at that meeting.

The average (daily) exchange rates are calculated on the basis of the foreign exchange purchase and sale transactions concluded that day at the interbank meeting, and for which sales agreements are issued and signed.

The average daily exchange rate for foreign exchange is established on the basis of the value of the transactions concluded for the purchase and sale of individual types of foreign exchange and the exchange rates at which the transactions are concluded.

The average exchange rate for foreign exchange which on a given day was not involved in purchases and sales at the interbank meeting is formed within the framework of the range between the lower and upper intervention exchange rates from the list of the intervention exchange rates of the National Bank of Yugoslavia.

Article 33.

At the same time as the calculation of the average (foreign exchange) exchange rates, purchase and sale exchange rates are calculated for each type of foreign exchange.

The purchase and sale exchange rates are formed on the basis of the average exchange rates, by subtracting or adding a margin of 1.5 thousandths of the established average exchange rate.

Article 34.

The exchange rates for foreign exchange calculated by the method stipulated in article 32 of this decree are entered into the list of exchange rates.

The exchange rates for foreign exchange in paragraph 1 of this article are expressed in dinars per unit of foreign currency for U.S. dollars, Canadian dollars, Kuwaiti dinars, Australian dollars, European accounting units, English pounds, and Iraqi dinars, and per 100 units for other foreign exchange.

The exchange rates are calculated to two decimal places.

Article 35.

The list of exchange rates from article 34 of this decree is signed by the person who chaired the interbank meeting and the representative of the National Bank of Yugoslavia.

The list of exchange rates is made public, at the latest, one hour after the conclusion of the interbank meeting. The list is made public on a board on the premises where the meetings are held, in the daily press, through radio and television, or in another manner, and the lists are sent to the banks that are members of the interbank meeting by 14:00 on the same working day.

Article 36.

The purchase and sale exchange rates from the interbank meeting's list of exchange rates are used by the authorized banks for all purchases and sales of foreign exchange that take place between them and the organizations of associated labor and other physical and juridical persons, except for the purchase of actual foreign money, foreign checks, and foreign letters of credit, and for the settlement of international postal orders, the exchange rates for which are formed in accordance with the provisions of article 5 of the Law on Exchange Transactions.

The purchase and sale exchange rates in paragraph 1 of this article are also used by the National Bank of Yugoslavia.

The purchase and sale exchange rates from the interbank meeting's list of exchange rates are used starting at 14:00 on the same day that the meeting is held, and the average exchange rates are used starting the next day after the interbank meeting is held.

Article 37.

After the conclusion of the interbank meeting, the authorized person who chaired the interbank meeting is responsible for sending the National Bank of Yugoslavia, on the day when the interbank meeting is held, the following:

a) a report on the supply and demand, and on transactions involving the purchase and sale of foreign exchange that are concluded at the interbank meeting on that day, and on the exchange rates at which these transactions were concluded;

b) a list of the exchange rates established and formed at the interbank meeting on that day.

Article 38.

The National Bank of Yugoslavia is obligated to purchase the excess supply of foreign exchange at the interbank meeting.

At the interbank meeting, the National Bank of Yugoslavia buys foreign exchange at the lower rate, and sells it at the higher rate, from the list of the intervention exchange rates of the National Bank of Yugoslavia.

Article 39.

At the interbank meeting, the National Bank of Yugoslavia intervenes to satisfy the excess demand for foreign exchange, in accordance with the requirements for payments abroad, which are established on the basis of the daily foreign exchange positions of the authorized banks and the plans for the receipt and outflow of foreign exchange of the authorized banks.

IV. Purchase and Sale of Foreign Exchange Under the Conditions of an Imbalance in the Supply and Demand for Foreign Exchange

Article 40.

When the conditions occur for application of the provision of article 110 of the Law on Foreign Exchange Transactions, all foreign exchange is bought and sold exclusively at the interbank meeting of the unified foreign exchange market.

The purchase and sale of foreign exchange and payments abroad under the conditions in paragraph 1 of this article take place on the basis of the joint foreign exchange position, and in the sequence prescribed by the Federal Executive Council.

On the day that the interbank meeting is held, if foreign exchange funds have been secured to pay for all of the priorities stipulated by an act of the Federal Executive Council, the authorized banks can make other payments abroad within the framework of the available funds between the prescribed minimum and maximum.

Article 41.

If it is established on the basis of the joint foreign exchange position that the authorized banks cannot make all the payments for priority purposes in accordance with article 110 paragraph 2 of the Law on Foreign Exchange Transactions, as established by the Federal Executive Council, the authorized banks are responsible for using the total foreign exchange funds above the established minimum to pay for priority purposes in accordance with the established sequence prescribed by the Federal Executive Council for that day, and for selling the excess funds above the requirements of the sequence of payments for that day at the interbank meeting to other authorized banks for payment for the same priority purposes established for that day.

Article 42.

The National Bank of Yugoslavia, through the joint foreign exchange position, the purchase and sale of foreign exchange at the interbank meeting, its inspectors at the authorized banks, and its inspection bodies, ensures orderly payment for individual priority purposes in accordance with the sequence established by the Federal Executive Council.

V. Records and Forms

The form for the sales agreement in articles 22 and 31, and the registry of foreign exchange purchase and sale transactions in article 32 of this decree, are printed along with this decree and constitute an integral part of it.

If a need has been demonstrated, the National Bank of Yugoslavia provides technical guidance for completing the forms that are printed along with this decree and are an integral part of it.

VI. Punitive Provisions

Article 44.

An authorized bank will be punished by a monetary fine of 500,000 to 5,000,000 dinars for an economic offense:

1) if it pays obligations abroad without first sending the National Bank of Yugoslavia its foreign exchange position and the summary of its foreign exchange obligations abroad (article 14 paragraph 1);

2) if it sells foreign exchange to another bank or buys it from another bank at an exchange rate other than the one established at the interbank meeting (article 15);

3) if it buys or sells foreign exchange on term during a period in which articles 24 and 110 of the Law on Foreign Exchange Transactions are being applied (article 24);

4) if during a period in which article 110 of the Law on Foreign Exchange Transactions is being applied, it pays foreign exchange abroad or buys or sells foreign exchange to ensure this payment, in violation of the joint foreign exchange position and the sequence for payments abroad established by the Federal Executive Council (article 40 paragraphs 1 and 2); and

5) if it pays a foreign exchange obligation abroad in violation of the established daily sequence or if it does not offer its excess foreign exchange funds to other authorized banks at the interbank meeting for the payment of the same purposes established for that day (article 41).

The action in paragraph 1 of this article will be punished as an economic offense, and the responsible person in the authorized bank will be fined 10,000 to 100,000 dinars.

Article 45.

An authorized bank will be punished with a monetary fine of 10,000 to 500,000 dinars for a violation:

1) if it does not establish a plan for the receipt and outflow of foreign exchange and a daily foreign exchange position, and send them to the National Bank of Yugoslavia (article 7 paragraph 1);

2) if it does not send the National Bank of Yugoslavia a summary of the due obligations for current payments abroad, the amount of which exceeds $10 million U.S., seven days before the obligations come due (article 8);

3) if it does not send the National Bank of Yugoslavia and the national bank of the republic or national bank of the autonomous province, by the 15th of the current month, a "Summary of Obligations for the Payment of Principal and Obligations for the Payment of Interest on Foreign Credits" for payments coming due the following month (article 9).

The actions in paragraph 1 of this article will be punished as a violation, and the responsible person in the authorized bank will be fined 5,000 to 100,000 dinars.

VII. Concluding Provisions

Article 46.

On the day that this decree goes into effect, the Decision on the Organization and Work of the Interbank Meeting of the Unified Foreign Exchange Market (SLUZBENI LIST SFRJ no. 12/85) and the Decision on the Conditions, Organization, and Work of the Unified Foreign Exchange Market in 1985 (SLUZBENI LIST SFRJ no. 12/85 and 52/85) cease to be in effect.

Article 47.

This decree goes into effect on 1 January 1986 and is to be published in SLUZBENI LIST SFRJ.

PROBLEMS IN INTEGRATING ELECTRIC POWER SYSTEM

Belgrade EKONOMSKA POLITIKA in Serbo-Croatian 24 Nov 85 pp 22-23

[Article by Dragan Nedeljkovic: "Planning for Shortages"]

[Text] The obligation to make joint plans for the development of electric power that was included in the new law on planning has caused genuine confusion in electric power organizations. In little more than a month the first year of the new medium-term period will begin; in this period, in which it will be necessary to act and build installations in a new manner, it is still not clear to anyone what to do with this obligation. It exists as a legal stipulation, it is clear to everybody that something should be done, but, at the same time, it is clear to everybody that it is impossible to implement the obligation in practice. Also, there is a dilemma regarding what to do with a law that is not implemented: the state and its authorities should force the implementation, and it is necessary to either make political decision or else declare the law invalid.

What is much more important than these, shall we say legal quibbles, is the fact that none of the joint goals can be implemented. The following have been proclaimed as joint goals: a reliable supply of electrical power to the consumers, the construction of installations that are the most rational possible from the point of view of energy and economics, and the optimal utilization of the electric energy system. The very fact that these goals for the development of electric power industry are being regulated by law indicates two essential things: firstly, that up to now the electric power system was not being developed in accordance with such premises that are fundamental to any economic activity and, secondly, that the economic system lacks an instrument that would force the electric power industry to behave in this manner. Can the new law on planning supplant all this?

Not Even the Construction is Being Observed

The key question is, what is preventing the implementation of the new law on planning? In essence, this law has changed nothing in the position of the electric power organizations. In accordance with a constitutional principle, the republics and provinces continue to be the ones responsible for developing electric power and for supplying the consumers in their areas with electric power, and the electric power organizations continue to belong to the republics or provinces. This means that the plants, legislation, expanded reproduction, the self-managing communities, and everything else are regulated by the socio-political communities. The technical and technological unity of the electric power industry remains the only thing in common. Consequently, in Yugoslavia one can ensure sufficient electric energy for all consumers only if every socio-political community fulfills its constitutional obligation and builds for itself enough production capacity to meet its energy consumption needs.

The greatest misfortune that has befallen past development, however, is the fact that this principle, reached by consensus, has not been observed. The socio-political communities have not built enough electric power capacity and so the balance sheets have already noted a shortage of electricity. This has been the practice in the last two medium-term periods, in which electric power as a whole has lagged behind as far as development was concerned, and consumption has grown faster that the building of new electric power plants. It is well known that this practice went on without consequences or, to be more exact, only the consumers have felt the consequences through reductions. The failure to observe the constitutional principle, however, has not caused any sanctions.

There are a number of other, one could say technical, obstacles to the implementation of the new law on planning; for example the time periods for the construction of electric power plants. All the power plants that will go on line during the next five years are already in an advanced stage of construction (they were selected, financed, and planned the old way), and it is therefore impossible to speak of joint planning of installations for the upcoming planning period. It is known that the study, planning, and construction of any significant electric power installation last more than five years.

Planned growth rates for electric power for 1986-1990

	Consumption	Production
Bosnia and Hercegovina	6.5	7.8
Montenegro	3.5	0.0
Croatia	4.8	9.2
Macedonia	4.1	6.7
Slovenia	4.1	1.1
Serbia	4.8	2.6
Kosovo	10.3	7.3
Vojvodina	4.2	6.3
Yugoslavia	5.0	4.9

A not smaller obstacle to the implementation of the law is the absence of a model for selecting economically rational production plants at the national level, the nonexistence of a model for joining together the resources of the electric power organizations, differences in how the pricing policy for electricity and its influence on expanded reproduction are understood, etc.

The Dilemmas of the New Plan

It will probably be possible to remove, in a relatively short time, the procedural obstacles to the new way of planning. The new plan, however, in the form in which it was cast by the republic and province electric power organizations, introduces an essentially new dilemma. During the past ten years, a period covered by two medium-term plans, the electric power industry has made plans for a balance between the production and the consumption of electric energy. Everything was in order as far as the planning documents were concerned, and the difficulties arose in the implementation. Stated more precisely, the plants were not built as planned while consumption increased. Electricity shortages came about as a consequence of delays and postponements in the construction and failure to implement what had been planned for. Now, shortages are being planned for. That is to say, as average annual growth of 5 percent is planned for the country as a whole, with a 4.9 percent growth in production. At first glance, the difference between the two figures does not seem to be very significant, but when it is converted into units for measuring electric energy it becomes very different. The total shortage of electricity for the five years, according to the plan, exceeds 8 billion Kilowatt hours; when broken down by year, the shortage starts out at 1 billion Kilowatt hours in 1986, and climbs to 2.4 billion in 1990.

Of course, the above will be true only if the plans are met, and no one can remember the last time when any of the medium-term plans dealing with electric power was met. There are a number of unclear assumptions in a plan that has been put together in this fashion, a collection of republic and province plans. For example, it has been planned that electric power plants using liquid and gas fuels would be utilized to a considerably greater extent than in 1985 and previous years, even though no one knows how to ensure fuel for them. Lack of fuel has caused these power plants to be more idle than operational during the past few years, and the new plan stipulates that they will be used at top capacity. It has also been planned to build certain electric power plants regarding which it is not known where they will be built or what kind of fuel they will use.

Croatian electric power industry wants and is planning for 700 megawatts worth of new electric power plants. It is making attempts to build them along the Drina river, in Kosovo, Kolubara, Tuzla, or anywhere there are natural energy resources, but there have been no responses to the offers and so it is completely uncertain whether, when, or where anything will be built; not to mention the fact that the electric power industry as a whole is entering the new plan period with a large deficit from the previous period, and that there already is a divergence between the production capability of the electric power industry and the consumer's needs.

This method of planning creates new dilemmas. It is at all possible to plan for shortages, and what does this mean? Without energy, it is useless to make plans for general development or a growth of income, social product, economy, and the standard of living. It is therefore necessary to coordinate the overall plans with the development of energy and either change the overall development plans or increase the production of energy. There is yet another possibility -- conservation and rational consumption of energy. Achieving that, however, would necessitate much more extensive socio-economic measures but, at the same time, the rule that it is only possible to conserve something that one has and not something that one does not have has been vindicated. It is evident that there is not enough energy.

It is strange that some socio-economic communities are planning for an increase in the consumption of energy without increasing production. Who will provide them with energy? Others are planning a greater increase in consumption that in production, and it is not clear who will buy (or import) electric energy from whom and how.

ELECTRIC POWER PLANS, NEED TO RAISE PRICE TO EUROPEAN LEVEL

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 13 Dec 85 p 1

[Text] Until acceptable domestic elements are worked out, electricity in Yugoslavia should increase in price on the average of 30 percent, in order to decrease the disparities with electricity prices in five West European countries. By next year, there will be enough electricity if approximately 64 million tons to coal, 800,000 tons of mazut, and 800 million cubic meters of natural gas are ensured for the appropriate electric power plants.

Belgrade, 12 December -- Delegates to the assembly of the Yugoslav Electric Power Industry Community feel that the prices of electric power in this phase should be formulated in Yugoslavia in such a manner as to decrease the divergence with the price levels in five West European Countries -- West Germany, Austria, Italy, Switzerland, and Greece -- by increasing the average prices of electricity. Since this criterium is not based on domestic considerations, efforts will be made to come up with criteria that will make possible the establishment of a long-term parity relationship between the price of electric energy and the fuel used to generate it. Thus, the price of electric energy would fluctuate according to the price of the fuel. This position will be forwarded to the Federal Executive Council.

Electricity producers feel that they are currently not in a position to accept the Federal Executive Council's position that electrical energy prices should be formulated on the basis of past and current work, nor can they accept the position that the price should be formulated at the same level throughout Yugoslavia. Even before the fall they have requested that the Federal Executive Council approve an increase in electricty prices averaging 30 percent, and to have the rate of increase applied in a differentiated manner in the electric power industries of the republics and provinces. Since the increase in prices did not date from the beginning of the winter season when the consumption is higher, this would only improve the drastically threatened financial position of the electric power organizations, without observing the position, containing in this year's resolution on having the price of electricity increase at a rate that is 10 percent higher than that of industrial products. At the end of the nine month accounting period, the electric industry organizations as a whole have posted a 36.8 billion dinar loss, which is 2.5 times greater than the loss sustained during the same period last year, in spite of the fact that they have increased their production by six percent and, as far as activity is concerned, they were in the third place in industry and mining in Yugoslavia.

The position of the electric power industry of Slovenia was at odds with the decision of the YUGEL Assembly. Slovenia insisted on the inclusion of a clarification to the effect that average increases did not imply the same prices throughout the country. This insistence is completely understandable but unnecessary, because the position makes it clear that the same prices would not be implied until overall conditions for this are created. This republic fears the implementation of the same price of electricity for the entire country because the cost of producing electricty is very high in Slovenia and an average price that would certainly be lower than Slovenia's price would not be in its interest.

The debate on electric energy balance and the economic position of the electric power industry as a whole make it clear that next year there will be sufficient electric power, but that it will be considerably more expensive. The general orientation is toward having the price of electricity approach the West European level at a faster rate. Currently, the disparity is over 50 percent. Stated more precisely, the average price of electricty in Yugoslavia is only 44 percent of the West European price, and the most expensive kilowatt hour is over 50 percent under the average. The long-term orientation is to reach that average.

The estimate is that next year approximately 80 billion kilowatt hours will be produced and consumed -- 5.1 percent more than in 1985. Such production will demand approximately 64 million tons of coal, 800,000 tons of mazut, and 800 million cubic meters of gas. Consequently, there should be sufficient electricity next year, provided that everybody does his part and that weather conditions do not deviate too much from the norm.

ARMED FORCES STRUCTURE, DEFENSE SYSTEM SUMMARIZED

Warsaw ZOLNIERZ POLSKI in Polish 15 Dec 85 p 21

[Text] More often than not we say "the military" and then also use the word "army" or the term "armed forces." The latter term first appeared in the 1850s when the need existed to find a common term covering both the land and naval forces; afterwards, it included the airforce.

The term "Polish Army" first appeared in the 19th century; it was officially introduced in 1918. The term was also used in a decree of the National People's Council of 21 July 1944, according to which the Polish Army in the USSR and the People's Army were united into the Polish Army. We also often say "the Polish People's Army," inasmuch as we wish to emphasize the character of our armed forces.

Current definitions of the armed forces include the concept that the armed forces are the forces and the means allocated by the state to protect its interests and to wage armed conflict. We are talking here not only about weapons, but also about an organization unique to the military.

The Armed Forces of the Polish People's Republic consist of:

--The Ground Forces
--The Air Force
--The Air Defense Forces
--The Navy

Each of these services of the Armed Forces is made up of various force and service branches. Take for example the Ground Forces which are earmarked for operations on land. They include mechanized and armored forces, air mobile and assault forces, rocket troops, artillery, air defences forces, engineers (sappers), chemical troops, ground force air forces, communications troops, radio and combat electronic forces, and others. Various kinds of service elements are also included in the Ground Forces. For example, health, clothing, and food provision services; these services provide the troops with everything they need, both during peacetime training and war.

The same troops and services may be found in the individual branches of the Armed Forces. For example subunits of chemical troops are found both in the Ground Forces, as well as in the Navy and the Air Force.

The Polish People's Army is made up of well organized branches of armed forces, including troops and services which lack for nothing.

As we have already mentioned, the Army is distinguished by its organization which ensures its operational efficiency and effectiveness. The Army can also be likened unto a pyramid; we will again turn to the Ground Forces for an example.

At the very base of the military pyramid there is the squad (a gun crew, vehicle crew, or a crew that services and maintains a technical piece of equipment); a squad is made up of several soldiers and is led by a squad leader (generally a non-commissioned officer).

Several squads make up a platoon which is commanded by a platoon leader, usually an ensign or a junior officer.

The next level of this pyramid is the company (in the Rocket Troops and Artillery, it is a batter); it consists of two to five platoons.

Several companies make up a battalion, the composition of which may also include support elements (sappers, for example). The battalion can be a part of still a larger military unit, the regiment.

The squad, platoon, company, and battalion are considered subunits, i.e., they belong to those military organizations which are called units. A separate tactical unit which has a commander, staff, quartermaster, and subunits is the regiment.

The next higher level of the military pyramid consists of tactical formations. These include brigades, which are made up of commanders, several units and subunits, and support elements.

The next higher tactical formation after the brigade is the division. The division includes: a commander and staff, several units, subunits, and support elements.

Who Directs National Defense?

The national defense is provided for by more than just military forces. The Armed Forces are the most important element, but not the only element of our defense system. From the previous lesson we know that the nation's armed might also includes the country's economic potential, administrative efficiency, etc. The direction of the nation's defense must include many areas. For this reason, the agencies directing national defense include political agencies of authority and state administration, and those social organizations and cooperative unions which undertake measures for defense needs overall.

Political Agencies

Overall direction of the state's activity in all areas, including defense, is provided for by the state's political power: The Polish United Workers' Party. The party cooperates with its allied partiers, the United Peasants' Party and the Democratic Party.

The highest party agencies which are directed by the resolutions of the national congresses, party conferences, and plenary sessions of the Central Committee set the overall concept of defense doctrine, the direction of defense policy, and the principles of operation for the defense system, the development and organization of the Armed Forces, and the participation of the public in the state's defense effort.

Agencies of State Power

As the highest agency of state power, the Sejm is also the ultimate decisionmaker in defense related matters. The Sejm's scope of authority includes the passage of laws which impact on defense matters. The basic laws of the Sejm in these matters is its Act of Universal Military Obligation to the Polish People's Republic.

The State Council is empowered to impose martial law and order mobilization. The council's chairman can also impose a state of emergency. During such times when the Sejm is not in session, the State Council can pass resolutions on a state of war with an enemy state or group of states.

The Council of Ministers is empowered to exercise overall supervision in those matters relating to national defense.

An independent agency, which has been entrusted with direct responsibility for the totality of defense and security measures, is the Committee for National Defense.

The committee's duties include:

--the establishment of general guidance in national defense;
--the review of the major problems in national defense and security matters and the delineation of the direction of efforts in this area, together with the totality of the country's socioeconomic development, and the realization of other national tasks;
--the introduction of a propsoal for the imposition of a state of emergency, or martial law, the ordering of mobilization, and the adoption of resolutions concerning war;
--the exercise of administrative functions in matters of national defense and security during the imposition of a state of emergency and martial law;
--the establishment of organizational principles for the Armed Forces, civil defense, and paramilitary units;
--the establishment of missions associated with the enhancement of state defense readiness and the supervision of these missions' accomplishment;
--the coordination of the actions of chief, central, and local agencies of state administration and the nation's economy in matters of national defense;
--the evaluation, supervision, and control of measures dealing with national defense tasks by agencies and organizational elements;
--the execution of other tasks dealing with national defense and security.

The Committee for National Defense is a collective body. It is made up of a chairman, deputy chairman, members, and a secretary.

The committee's chariman is appointed and relieved by the Sejm.

The committee's chairman exercises supreme authority over the Armed Forces of the Polish People's Republic. As the chief of the Armed Forces, the chairman is empowered to:

--determine (at the initiative of the Minister of National Defense) the key trends in the development of the Armed Forces of the Polish People's Republic and their training for national defense;
--express opinions with regard to candidates for the position of Minister of National Defense, chief of the General Staff of the Polish Army, and the commanders of the military districts and branches of the Armed Forces.

The Minister of National Defense commands the Armed Forces and directs their development, training, and readiness in the national defense effort. The minister's principle executive agency is the General Staff of the Polish Army.

Several duties in the area of the state's military defense are executed by the Minister of Internal Affairs; he is responsible for public safety, border protection, combating subversion, guarding economic facilities, etc.

Various other ministers, chief state administrative agencies subordinated to the Council of Ministers, social organizations, and cooperative unions also participate in the realization of defense tasks. Tasks in the area of civil defense are executed by the Chief of Civil Defense. His executive agency is the National Civil Defense Inspectorate.

Local Agencies of Authority and Administration

The people's councils help in strengthening of security and defense readiness in the local area, but direct control in these matters belongs to the provincial defense committees (WKO).

Defense issues are also resolved by local associations, enterprises, plants, and institutions directly subordinated to provincial governors and municipal chairpersons.

Thus, practically all agencies in our country are concerned to a certain degree with defense issues, although the scope of their actions varies.

DRAFT OF NEW PARTY STATUTES ANALYZED

Prague RUDE PRAVO in Czech 14 Jan 86 p 1

[Text] On Monday, RUDE PRAVO and PRAVDA carried the full text of the statutes of the Communist Party of Czechoslovakia, along with proposed amendments. The document will be submitted for debate to the 17th Congress of the CPCZ at the end of March this year. Now, the amended statutes of the CPCZ are being presented to the party and to the broad public for familiarization. The principle that the party bases its work upon broad knowledge among the populace and upon gaining the public for realizing the policies of the party is anchored in the statute proposals anyway.

The statutes fulfill an important mission equivalent to the fundamental law of internal party life and in the application of the avant-garde task of the party in its fight for realizing the policy line of creating a developed socialist society. The party statutes express the 65-year-old political, ideological, and organizational experience of our party, and they include even the most proven experiences of the Leninist party and those of other fraternal parties.

"The party," it is stressed in the statutes, "is guided in its work by a scientific world view, by the revolutionary teachings of Marxism-Leninism, which form the foundation for its policy and its everyday organizational activities. The party creatively develops Marxism-Leninism, decisively fights against all manifestations of bourgeois ideology, against revisionism and dogmatism, which are absolutely alien to revolutionary theory."

The proposed amendments express the requirement for the growth of the party tasks in the current era of creating a developed socialist society, demands for perfecting the style and methods of its work, the deepening of the leading role of the party in all sectors of social life. At the same time, they reflect the rich experiences of party organs and organizations, which confirm the long-term unchangeable validity of the Leninist principles and standards they contain.

The constantly increasing demands made upon the party and the growth of its influence in all spheres of social life raise the significance of party membership to a higher power. Today, involved attitudes and actions on the part of all members and candidate members are important and not just on the part of those who hold party or public office. That is why the proposal includes, among others, the provision that a communist has a duty to consistently press for and realize the policies of the party, to clarify it for the broad masses and to gain their support for its realization, to be in constant touch with people, to carefully take note of their views and needs and to react to them in a timely manner. A Communist must conduct himself and appear at all times as a Communist.

All-societal requirements also demand that the principle of social justice in accordance with working merits be promoted and, last but not least, that a decisive battle be conducted against the disruption of socialist legality, socialist morality, and other antisocial manifestations. A Communist must be an active, ideologically firm, and disciplined fighter for the party.

The proposed changes to the party statutes state that a party member is obligated to participate actively in the activities of his basic organization and to be coresponsible for the results of its work, to participate in the preparation of and conduct of membership meetings and in the creation and implementation of resolutions.

The strengthening of party discipline and the strengthening of the tasks of basic organizations is outlined by an additional important proposal, that is to say, the proposal that basic organizations of the CPCZ have the right--with the knowledge of the responsible party organ--to deal with cases of even those Communists who hold office in state, economic, or social organizations and who have violated party statutes and socialist legality. If these Communists are called to account for their actions by a higher party organ, that organ will inform the responsible basic organization of that fact.

The task of social and economic development of the country demands that the activities of party organs and organizations be constantly increased, requires that the party's influence be asserted in all sectors of societal life--in other words, it requires the universal perfection of party work. For this reason, the statutes stress that party organs and organizations apply Leninist principles and methods of management, assert the Leninist style in their work in all sectors of state, public, and economic administration. From the standpoint of contemporary tasks, this means that in these sectors materialness, a critical view, is to be asserted, deep knowledge is to be applied in solving complicated problems and demanding tasks must be assured. It is necessary to deepen work involving people, to hold the party and people accountable for work done, to consistently fulfill resolutions and tasks. Toward this end, it is essential to assure the unity of ideological, organizational, and economic activity, to see to the strengthening of state and work discipline.

The experiences of numerous basic party organizations confirm the importance of the right of party control as an important instrument for the political influencing of the economy. The correct and consistent application of this right affords party organizations more universal conditions for developing control activity--greater influence upon the assurance of economic tasks. The proposed statutes expand the right of control in additional agricultural enterprises, in scientific research institutes, in the housing economy, in communal services, in schools, in cultural, enlightenment, and health facilities. In this connection, the statutes contain, among others, a proposal giving the opportunity to all basic organizations which have the right to exert control to express themselves with respect to the nomination or recall of leading workers in the area of their jurisdiction.

The intent to apply the leading role of the party in state and social organs and organizations in a more intensive manner is addressed by supplementing the statutes by the addition of a fundamental principle covering the party leadership of these organizations: The party will direct the activities of these organs and organizations through the medium of Communists who work in them. In the chapter on the party and youth, it is proposed, in addition to existing provisions, to stress the duty of party organizations to care for the development of the Socialist Youth Association, to see to the fulfillment of its tasks as a representative of the young generation and of a soon-to-be fellow combatant of the party.

It is necessary to constantly deepen the knowledge of the statutes and to apply them in everyday political and organizational work. The importance of goal-oriented work involving the statutes is underscored by the fact that the ranks of Communists are expanding each year by the addition of tens of thousands of young people. However, no one becomes a Communist by merely being accepted into the party and by accepting a party card. And so, knowledge and the comprehensive application of the statutes is one of the fundamental prerequisites governing future increases in action capability and effectiveness of the work of fundamental organizations and the activities of Communists.

In the near future, delegates from okres and kraj party conferences will be expressing themselves with respect to the proposed changes in the party statutes. By their essence, the essential adjustments are aimed at strengthening the authority of the statutes so that they could fulfill their function under current conditions governing the activities of the party even better than heretofore and the adjustments are also aimed at assuring the necessary tasks in the future.

NEW RULES FOR NATIONAL ASSEMBLY: TALLY, DEBATE, NEGATIVE VOTES

Budapest MAGYAR HIRLAP in Hungarian 31 Jan 86 p 5

[Article by Balint: "The Legislator's Responsibility. A Meeting of the National Assembly's Budapest Delegation"]

[Text] The invitation that the deputies received was for an informal discussion. What is the deputies' most important task: legislation, the management of local public affairs, or the safeguarding of the citizens' interests? Is it possible to oversee the implementation of the enacted laws? How binding is a vote in committee, and how should the outcome of the committee's debate be reported to the full National Assembly? These and similar questions were raised at the Wednesday meeting to which Istvan Sarlos, the National Assembly's chairman and a member of the MSZMP Politburo, had invited the Budapest delegation in the National Assembly. Karoly Grosz, first secretary of the Budapest MSZMP Committee and a member of the MSZMP Politburo, attended the meeting.

By way of introduction, Istvan Sarlos raised several questions. In view of the fact that two-thirds of the deputies are freshmen, he reviewed the novel requirements stemming from nominating more than one candidate per election district, and from the new electoral system. One of the objectives had been to elect fewer top executives, professional functionaries, to the National Assembly. The population nevertheless nominated mostly qualified candidates in high positions, an indication of the public's more moderate confidence in persons with little experience in public affairs. The nomination of more than one candidate per election district means that there is a closer dependence between the voters and the deputies. After all, when there are two or more candidates to choose from, the citizen will follow more closely the work of the candidate he favored, and the deputy will hold regular briefings for his constituents. Istvan Sarlos emphasized that the holding of such briefings is merely a right, and not an obligation. But this way it carries more moral weight than if it were prescribed by statute or directive.

The deputy's primary task is the enactment of legislation. This entails attending not only the sessions of the National Assembly, but also the committee meetings to form an opinion there. Yes, but often the deputies receive the text of a bill just before the start of a session, while the national organizations and the central agencies concerned get their copies months earlier, protested Dr Frigyes Tallosi, the deputy representing Budapest's 24th election district. Istvan Sarlos promised that the deputies will receive the necessary documents a month before the start of the National Assembly's spring session. He requested the deputies not to be afraid to express their views, including possible objections, also before the full National Assembly, and not only before its committees. But most of all they will have to speak as briefly as possible and stick to the question. It will be possible to request the floor not only in writing before the start of a session, as up to now, but also by raising one's hand. Thus anyone who has something meaningful to say will obviously speak to the point even without signing up to speak.

How and why should a deputy put a question to the government? He should avail himself of this opportunity preferably only in matters of national importance. In matters of minor significance, the deputy may call on the minister or other official also directly. The question, too, ought to be brief. The deputy should not attempt to also answer his own question; he should leave that to the minister. Incidentally, the deputies should not be afraid to see opposing votes more frequently than up to now. This means that everyone makes up his own mind, in accordance with the interests of his constituents. The delegation from a given megye or region may also agree in advance on what standpoint to adopt and how to vote on this or that question. Professor Kalman Szabo, representing the 36th election district, wanted to know whether this might not be construed as factionalism. He also pointed out that the Presidential Council is assuming the National Assembly's role on many important issues, and thus several questions that would have required laws are regulated by law decrees. He requested that the National Assembly be given an opportunity also to oversee the implementation of the enacted laws. For example, business organizations are completely disregarding several sections of the Enterprise Law, as if they did not even exist. Peter Biacs (30th election district) cited the Environmental Protection Law as an example; its executory instructions have not been issued to this day. The chairman of the National Assembly replied that its operation has often been disrupted by failure to present to the full National Assembly the draft of the executory instructions, together with the considered bill, whereas only in this way can the two be compared and the possible contradictions identified.

Istvan Stadinger (6th election district), deputy chairman of the Budapest Municipal Council, asserted that the Budapest delegation is not sufficiently active in the National Assembly. The deputies are not showing initiative even on important issues. In his opinion, debate should be meaningful also before the full National Assembly, and not only in committee. Dwelling on the role of the press in reporting the proceedings in the National Assembly, Pal Gagyor (he represents the 13th election district) began by saying that he often had to yawn when watching the evening news summary on TV after a session of the full National Assembly. The many reports, in his opinion, do not present by far an accurate picture of a deputy's work. The reports on committee meetings are dull, and all newspapers publish identical reports on the proceedings of the full National Assembly. Istvan Sarlos replied that the National Assembly's Press Office will open on 1 February, which is tomorrow. Its task will be to organize and coordinate public information about the work of the National Assembly and its deputies. Pal Gagyor asked whether it will be possible to tally the votes electronically. The chairman of the National Assembly replied that such a system has been requisitioned, the money for it is available, and it will be installed sooner or later. It will be possible to use the system immediately to tally the votes on bills, resolutions, and questions put to the government.

Emil Pejak, the chairman of the Budapest delegation, also passed on some of the comments that had been made to him. Several deputies had requested that also the organizational and operational (mainly public administrative) questions concerning essential changes in macroeconomic management be submitted to the National Assembly in due time. Deputies should not have to learn from newspapers about important economic decisions and appointments. Istvan Sarlos recognized these requests as warranted and admitted that the briefing of the National Assembly's deputies still leaves much to be desired. Several deputies complained that the councils and other agencies are not observing the eight-day time limit within which they have to answer letters from deputies. But Emil Pajak, too, emphasized that the primary task of the deputies is to manage the nation's affairs, rather than to perform local duties that fall within the scope of the councils or the IKV [Real Estate Managing Enterprise].

As a "veteran" legislator, Kalman Szabo mentioned that during his long years in the National Assembly he does not recall a single informal meeting of this kind with the National Assembly's officers. Such meetings are an important source of information, for the more experienced deputies and the freshmen as well. In his summation, Istvan Sarlos noted with satisfaction that many practical questions have been raised at the meeting, questions of the kind that rarely can be considered in committee or by the full National Assembly. It would certainly be useful if the other megye delegations held similar discussions on the conditions, means and further possibilities of the deputy's vocation. All this makes for the greater effectiveness of the National Assembly's work.

POLITICS HUNGARY

DEPUTY VOTING AGAINST 1986 BUDGET INTERVIEWED

Budapest HETI VILAGGAZDASAG in Hungarian 4 Jan 86 p 5

[Interview with Deputy Istvan Avar, by Gyorgyi Kocsis: "Opposing Vote"; date and place not given; first paragraph is HETI VILAGGAZDASAG introduction]

[Text] In their coverage of the proceedings in the National Assembly, the newspapers reported: "With one opposing vote, the National Assembly passed, both in principle and its particulars, the bill concerning the 1986 budget of the Hungarian People's Republic and the 1986-1990 medium-range fiscal plan of the councils." The subordinate clause at the beginning means that Deputy Istvan Avar, the actor (aged 55), voted against next year's budget. We asked him: What were his reasons for doing so?

HVG: Nearly 400 deputies voted for next year's budget. You alone voted against it. Why did you cast a negative vote?

I.A.: I have not the slightest intention to speak out on fiscal matters with which I am not familiar. I nevertheless decided to vote against the bill because, in my opinion, the 5-percent rise of the consumer price level projected in the 1986 budget does not reflect reality. I am not an economist, but I do walk the streets, buy in stores, and talk a lot with people. When I face my constituents, they raise hard questions, and I have to answer them truly. I believe that our society is mature enough to be told frankly that this year prices will go up, say, 10 percent. People accept this more readily than when they are given a lower figure, which they eventually find too low. There was also another reason why I voted against the bill: I did not know in advance about the specific price increases. For the deputies who are not on any of the economic standing committees--I myself am on the Cultural Committee--have no advance knowledge of such things. Of course, we did get a number of important, confidential documents to prepare for the session. But these details were new to many of us.

HVG: Did your opposing vote cause a sensation?

I.A.: Actually it did not. Anyone who was in the National Assembly when this part of the budget speech was presented can testify that some of the deputies were grumbling. Incidentally, my opposing vote went practically unnoticed.

HVG: In your opinion, does it take courage to cast an opposing vote in the National Assembly?

I.A.: No, it does not require courage! But strangely enough and to the best of my recollection--I have been a deputy for 12 years--such economic bills have always been passed unanimously. I would like to make clear that my opposing vote has not been motivated by a desire to be conspicuous or in the limelight. I have ample opportunity to appear on stage. It has been cast because, in my opinion, we ought to show this society the courtesy of greater frankness. Furthermore, I wanted to call attention to something that has become perfunctory, to the voting.

HVG: Why did you not request the floor at the session? Why did you not present your contrasting opinion there?

I.A.: It is customary for deputies to indicate before the start of a session that they will want to speak. Because I just learned of the objectionable provisions there, I would have been able to raise my hand only then. There is no precedent for requesting the floor in this manner, even though no rule prohibits it. Finally I decided to vote against the bill because I felt that if I am not sitting there as an enemy, then why should I conceal my opinion?

HVG: You mentioned that you have been a deputy for 12 years. Have you cast an opposing vote at any time before this?

I.A.: Only once. I had been in the National Assembly for perhaps a year. A teacher from the provinces put a question to the minister of transportation and post. The deputy who put the question accepted the minister's reply. I did not.

NEGLECT OF EDUCATION COULD BE POLITICALLY EXPLOSIVE

Budapest MOZGO VILAG in Hungarian No 12, 1985 pp 70-76

[Article by Szabolcs Szunyogh: "A Lost Generation?"; footnote 2 missing in original text]

[Text] So far the general public has not perceived how dangerous the so-called demographic wave is. With respect to the current school situation, the abnormally large number of children has weighed heavily only on the public elementary school, i.e., it has weighed more or less equally heavily on everyone, on every student. There are, of course, exceptions: public elementary schools can be found where the conditions are much better than the average, where the number of pupils per class is smaller, where the supply of specialized teachers is complete, etc. But the quality of education--in short, the connection between the parents' station in life and the opportunities for earning a living offered by the school--is incomparably more pallid than it was in the autumn.

The fact is that kindergartens are becoming less crowded. Fourteen thousand fewer children were enrolled in these establishments than last year, so the wave is already subsiding in this sense. Seventeen thousand more children nevertheless attended public elementary school than during the previous year, but the number of first-graders--and this is the noteworthy thing--is smaller than that of second-graders, in other words, last year's first-graders, by about 9,000. That is to say, the demographic wave trough has already reached the public elementary school, and the wave is now rising before the entrance gates of secondary educational institutions.

(This "now" is, of course, a rather vague temporal adverb. It happened during the past academic year that the number of students per high school class was raised to 35 or 40 to no avail: there were simply no schoolrooms for some classes. At Margit Kaffka High School, for example, some classes were held in the dining hall, the gymnasium, even the corridor.)

So far the demographic wave has exerted uniform pressure on everyone, because there is only one kind of public elementary school. There are three kinds of secondary educational institutions, however, or to be more precise, three and a half: high school, vocational training institution, specialized secondary school, and the technical school which in some places is combined with it. The cultural government wants to "carry off" the demographic wave through the vocational training institution, obviously because this is the cheapest solution.

Instruction at the vocational training institution does not last 4 or 5 years, the way it does at the high school and the technical school, but only 3 years. Furthermore, these 3 years are actually only 2, because the students largely spend the last year in workshop practice.

So the high schools and the specialized secondary schools do not receive the bulk of the money. The developmental resources are not "concentrated" there, and consequently the children of parents who advanced to their station in life from the high schools are in an instant squeezing everyone else out, no matter how talented that "everyone else" is. The battle is beginning for admission to high school, which means an opportunity for further education: this battle will end in defeat for the majority, and this will cause as much tension as a 15-percent price increase before Christmas.

In connection with the wave, the critics usually and quite correctly bring up the government's responsibility. They reel off the bad decisions--for example, regionalization--and urge the local leaders to make more courageous use of various stopgap measures: provide instruction in a foundationless barrack, build schools from FORFA and BETONYP elements, or use the half-empty cultural centers for educational purposes. Apart from the fact that I completely agree with all this and that I include on the list of available places the district offices of the Youth Guards and the Communist Youth League, I would quickly add that I do not intend to harp on the school situation caused by the demographic wave. This is a pedagogical bone from which the justifiably enraged investigators have already gnawed everything gnawable. For me the only thing important to establish is that birthrates in recent decades have risen and fallen as a consequence of life outlooks and central measures which seek to improve the birthrates, but the development of conditions in the schools has borne no relation at all to the fluctuation in the number of persons per age group who attend school.

"Let us take the year 1957 as an example," writes Katalin Csato. "At that time the birthrate declined rather drastically, by 13 percent compared with the previous year and by 26 percent compared with 1954. This age group started school in 1963. The number of students per classroom was 46.6, higher than in 1960-61. The year 1962 was the low point with respect to birthrates, 12.9 per thousand inhabitants. (Only in 1982 do we encounter a similarly low rate.) Nevertheless, when these children started school in 1968 and the number of first-graders, roughly 140,000, was the lowest in nearly 2 decades, the number of pupils per classroom was still around 40...The schools experienced even the demographic low point as a demographic peak." (Footnote 1) (Katalin Csato, "Is It Possible to Plan a School for Demographic Peaks?" KRITIKA, 1985, No 1)

In other words, it does not simply boil down to the fact that some educational decisions proved to be wrong or that the cultural government did not possess adequate foresight in certain cases or even that shortage of money is the source of problems, because educational conditions did not improve sufficiently even when fewer children attended school. The supply of teachers--the most important condition for instruction--has constantly been curbed by the permanent restrictions on those who participate in education.

To be more precise: whether it is a question of teacher training, better lighting, more modern educational equipment, or construction of buildings, the money spent on educational matters expresses with utter clarity the trust society places in its own future or the ability of society to look after its future under the pressure of everyday circumstances. It is a very big problem, among other things, if society yields to the pressure of circumstances and attempts to overcome its troubles with the help of a fire extinguisher, because this causes errors of identity. Direct outgrowths of the identity mixup are: an intellectual vacuum which manifests itself in the propagation of the most diverse aggressive customs; apathy and the spread of polarized extremist views; or--let us take an example from somewhere else--a population decrease which spontaneously curtails society's regeneration.

If the government spends a lot of money on schools, it confirms the people's feeling that the leadership can surmount daily problems and can think in terms of at least a decade at a time. This feeling, if it existed, would be an important factor in political stability.

During the past year, 1,429 teachers left the teaching profession. This number is much more serious than the number of university students who do not become teachers. These fourteen hundred persons tried to earn a living as teachers and did not succeed. No one can say how many of the fourteen hundred left the teaching profession for financial reasons and how many departed because of a conflict between reality and their ideals. Even though there are obviously those among them who are better off if they do not teach, for one reason or another these fourteen hundred teachers sought other work, and the community of teachers is poorer because of those persons who had the strength to change. It is impossible to estimate to what degree the professional standard of those who have remained in the field and, of course, their human productivity have declined because of catastrophic working conditions and teacher salaries which trail those of other white-collar professions by 8-15 percent.

Teachers are in short supply and, if we can believe the forecasts, they will remain so. Will the supply of proficient teachers with university degrees be 74.5--77.6 percent in the year 2000?

The backlog in school construction can be explained by financial reasons, but why the number of those admitted to teacher-training facilities is not increased can hardly be justified by the budget's empty pocketbook. There is no doubt that more teachers could be trained, and the expenditure increase cannot be compared with the price of building a school (each classroom costs 2.5-4.0 million forints).

This year, cautiously and to a slight degree, the number of those admitted was raised. Apart from this, the counterarguments continue to reign.

According to them, higher education in Hungary differs from the university system of the advanced industrial countries in that here the number of those admitted is attuned to the manpower needs of the people's economy. It is not stated but it is unambiguously suggested that the state accepts responsibility for finding employment for certified graduates of universities. That is why no more students can be admitted than there will be a need for (as graduates) in 4-5 years.

According to this logic, the university is similar to those sectors of the service industry--be it a question of cambric, taxicab, or commerce--which consider it their task to cater to the people, not to obtain a profit. To this the people rightfully reply that the paternally provident aim of commerce is pleasing, but since it is not free and since merchants do business with us for our money, we certainly would not mind if in place of their otherwise sympathetic concern they ran their businesses. I enter a store and buy something for my money; the salesman, however, sells; and we should remain on these terms. If the salesman is promoted to a supplier, then he immediately becomes an authority, and as an authority he nonchalantly declines responsibility for the entire mixup in supplies, alluding to the objective difficulties and asking the people to please recognize his good intentions. The people cannot really do much else in this situation, or rather they can decide not to recognize his good intentions, even though this does not change anything. If, however, the commerce ventures out onto the market and begins to do business, then the buyer enjoys all those positional benefits which devolve upon the customer in the customer-salesman relationship.

Maybe this logic is acceptable in the case of grocery stores, runs the usually offended counterargument, but it is hardly serviceable in the matter of higher education. The university cannot regard as an equal (if you please) business partner the youth who takes an entrance exam and chooses a career, partly because education is free in contrast to the grocery store, partly and mainly because every danger of movement in the labor market would be shifted to the students, and this could cause innumerable tragedies. After all, at the time they select their careers, persons take into account the profession's prestige which has developed over the decades and not what the likely manpower situation will be in 4 or 5 years according to various official forecasts. It could happen that many university graduates would not find themselves jobs, so it is in their interest not to be admitted to the university.

Aside from the fact that this line of thinking views human beings as incapable of making decisions regarding the most important questions of their lives and aside from the fact that this line of thinking seeks to compel a state of irresponsibility upon young people who are choosing careers, it is not at all necessary to concern oneself about employment opportunities because the state guarantees a job--in short, aside from all this, the logic is weak in its most important points. Because what the state guarantees is not what the university students regard as an employment opportunity, and justifiably so: a job teaching in Biharugra, let us say, is not an acceptable offer of employment for a youth born and raised in Budapest. Furthermore, the fact that university education is free imposes burdens which are more and more difficult to bear for families of medium--or let us put it this way: average--income.

The main problem with this line of reasoning is not, of course, that it is disputable but that it suggests rather than states the essential counterargument. The fear of overproduction of intellectuals probably prevents a radical increase in the number of teacher trainees. Let us immediately add that this fear is not unfounded. A class of university graduates without jobs, if it is a class large in number, carries with it the danger of political instability.

That not as much has been spent on education's infrastructure as should have been can be explained by the fact that not as much has been spent on any sector as should have been. But that the number of teacher trainees has always been kept below what is needed can only be explained by a lack of confidence in the unemployed university graduates. And thanks to this lack of confidence the situation is substantially worse than it might be, and this is good because it drastically reminds us that the generation of the demographic wave is a dangerous generation. Time bombs are ticking away among its ranks, and it is good that this ticking is now louder than it might be. The bomb which is ticking, namely, can still be defused.

Quite apart from the errors in pedagogical leadership, there are actually more of these children than Hungary in its present condition can honestly teach. Not only is there a shortage of public elementary schools for them, there is also a scarcity of secondary schools, there will not be enough universities, and they will not find satisfactory jobs for themselves.

There are, of course, frightfully few of these children. They are the minimum: at least as many persons are needed annually in order for there to be 10 million of us--and since the wave-trough generation continues after them, the country's population is declining.

What it does not boil down to then is that the cultural leadership would make some catastrophic mistake if it adapted the school system to the "demographic peak." From the viewpoint of society's regeneration, this peak is no peak at all but rather, let us say, a lowland. And behind the lowland is the precipice.

In an age of pursuit of supremacy, was it the general line of thought that a country's number of inhabitants was a value in itself? For every human being of sound mind, history has definitively refuted the reality of pursuit of supremacy. I do not consider it likely that owing to the dream of a Hungary with 40 million people the general public finds it painful that in a few years there will not even be 10 million of us. It does not just come down to the fact that the country's number of inhabitants is an essential factor in the country's self-preservation even though, perhaps, this is not as foolish a claim as it appears in the mirror of many setbacks in self-protection over the centuries. I believe that there really need to be as many of us as possible because the more persons a country consists of, the more trends, lifestyles, and forms of social conduct it can evolve and the better it can turn into a laboratory for solving the problems which afflict all mankind, or to put it more simply: for a small country it is a sufficiently heavy burden if it wishes to take reality upon its shoulders and collapses. Without this requirement, it is not possible to live, only to more or less vegetate.

Given the economic situation, it is also dangerous to have too many people: because of unemployment in the factories, productivity declines, the jobless spill out into the streets, incomes are reduced due to the deterioration of productivity and the scarcity of jobs, and the people become angrier and angrier. In this mutinous domestic situation, however, only he who is unskillful does not fish, and it is the experience of this country over many centuries that the fishermen are not unskillful.

Mentioned in the introduction, the conflict which is erupting between the secondary schools and the demographic wave now makes perceptible what kind of social tension this conflict will soon cause: the kind which can become political at any moment.

There are two solutions to this national overproduction of people. One is emigration, and the other is prosperity.

It can be explained as a national tragedy of destiny if another 1 or 2 million persons stagger into America. If, however, it does not concern Hungary but rather, let us say, Italy, Turkey, Suriname, Portugal, etc, then one calmly acknowledges that once there is a world market, then labor and capital move around in that market, and this is proper from the standpoint of capital, labor, and the world market. Indeed, even the home country receives certain minor advantages: through emigrants, it becomes more strongly linked than before to international economic life, it can count on a definite inflow of currency, and by granting permission to emigrate, tension is eased, and the boiler is allowed to release its possibly explosive steam.

It is thus almost completely certain that leaders who let themselves be driven into a tight corner will turn to emigration as a last resort, if no other course is open.

Emigration does not, of course, solve the problem of educating growing numbers of children in various age groups, because children cannot, after all, be let out into the big, wide world to try their luck. The manner in which the question raised by the demographic wave is answered will not only influence the public mood during the next few years but at the same time, by way of experimentation, will serve as a lesson for solving the problem of growing numbers of adults in various age groups.

"We have no mineral treasures, no significant energy resources, we have nothing except human beings," said a Japanese professor. (Footnote 3) (Andrea Karpati, "The Japanese Miracle--the Miracle of Education?" PEDAGOGIAI SZEMLE, 1984, No 6) It is fairly well-known that the miracle of education laid the foundation for and preceded the miracle of Japanese industry and of the entire Japanese economy. I personally dislike this miracleworking Japanese school system. Partial observations can surely be accepted, but I hold that the militarized educational system with whose help the battle (declared in 1872) against illiteracy was won by the Meiji restoration in a way which spoke to the world in 1907 leads to aggression, excessive national self-appreciation, and the servility which accompanies it. "The nationwide campaign of modernization swept away the small private schools, and more productive 'people factories' took their place. The teacher took his seat on the platform, and the students in their black uniforms--like a faceless army--looked up at him. The military code and the law which defined the schools' curriculum and operational order appeared at the same time in 1890. Several historians of education have pointed out that not only the date of appearance but also the style and content of the two imperial documents are similar." (Footnote 4) (Ibid.)

One sometimes has the feeling that some teachers in our country, too, are tempted by this type of mass education. Maybe this possibility has not turned into a broader trend because they are unable to fulfill the role of teacher reigning at his platform or of overworked mother/schoolmistress of the definitively feminized profession of teacher.

Let us venture a heretical thought and assume that some of the more successful reform ideas in economic life could also be applied to education. Society should be offered an opportunity to produce as many better schools as it can undertake. (At the same time, this would serve as a basis of comparison: are family budgets more willing to sacrifice significantly more for the future, for children's education, than the state budget?)

Instead of elaborating the plan for the faculty association school and in place of details about legal and financial regulations, such a short essay can only undertake to sketch the basic formula for a possible model. According to it, teachers who work in the association school would not receive their salary from the state, and the local budget would guarantee only the operating conditions: the building, heating, lighting. Each student pays a tuition fee of--let us say for simplicity's sake--500 forints a month. Without deductions for taxes, etc, this would mean a monthly salary of 10,000 forints for the teachers, if there are 20 students per teacher in the school.

In connection with association schools, a person who has grown up with democratic traditions will offer nothing but counterarguments at the outset. After all, this would mean in practice the reintroduction of rating (voters) according to property qualification: he who has the money to pay the tuition fee can send his child to a much better school and offer the child much broader opportunities for earning a living, and thus, from the students' viewpoint, an utterly unjust difference arises among students.

Then there are the less frequently expressed counterarguments. Let us try to put them into words. With the creation of association schools, there may occur in the state education monopoly a rift which in itself is now utterly harmless perhaps, but all it takes is a swing of the ax-blade to fell the tree. Finally, even today there are elite schools, but admission to them is not determined by who can pay the tuition fee--after all, many can pay the tuition fee, and therefore there are few of these elite institutions--but by the parents' contacts. And since up until now--as a job perquisite, so to speak--these parents received better learning opportunities for their children, they would feel deprived of a right (privilege) they had acquired if they were now suddenly forced to pay. Seldom do people voluntarily renounce rights they have acquired. As a result, it is utterly useless to put the idea of association schools to the test, because by citing democratic arguments the beneficiaries of the present, less democratic system of elite schools would in any case immediately torpedo this more democratic system of elite schools.

Let us look at what arguments can be advanced in favor of the association school. For all practical purposes, I have already refuted the first counterargument: a property census is much more democratic than a census based on contacts and, moreover, this sum of money is not so high that it excludes very large throngs of people. It might be possible now to examine at great length the structure of consumer behavior in various social classes and--aside from the fact that it holds out bright prospects for a well-developed small doctor's apparatus--it may demonstrate what everyone knows, namely, that white-collar workers spend more money on intellectual products than do those in non-white-collar professions. At the same time, of course, it is well-known that the general population, oftentimes struggling with basic financial problems, is today spending greater and greater, even enormous, sums on books and records--and this is not characteristic of just white-collar occupations.

Two poles: even among those who could attain it (not on the American scale, of course), the American-style consumer life model, i.e., a life model which pursues only economic symbols, is not common. Instead we can observe a revival of the traditionally European lifestyle. Its essence does not lie in spasmodically increasing the living standard but in making the quality of life more human, i.e., in the production and consumption of cultural goods. On the other hand, it is well worth seeing how great the number of students from traditional blue-collar-worker districts is who apply to music school, or how more and more municipal elementary schools offer English lessons, and that if people who belong to the more modest income classes ever once and for all overcome their most oppressive financial problems, they would spend gigantic sums on their children's education. I believe they would spend much more if there were more plentiful opportunities.

I add somewhat timidly that there is also family responsibility. From the children's viewpoint, a genuinely unjust disparity in knowledge arises among students if one family forgoes a vacation in Spain and buys a Trabant not a Zsiguli, or buys no car at all, but provides for the children's education with the money thus saved. Question: from the families' viewpoint, is the disparity which thus arises among the students' level of knowledge unfair? Should we stop people from being able to spend what little money they have on better schools for their children? In comparison with how astonishingly weak their knowledge is, children spend an astonishingly large amount of time in classrooms. Nowadays the family can counterbalance this weak knowledge only by financing private lessons: why could it not finance the school itself? The parent who spends his money on luxury articles--not necessarily alcohol but a plot of land, a summer vacation, a bathroom with purple tiles--would like to prevent the neighbor's child from being better educated than his own and then becomes indignant when the neighbor, who does not yet have a bathroom with purple tiles, provides his child with more thorough knowledge. He who is concerned not with nullifying another person's potential but with developing his own can only applaud the prospect of establishing a better school.

I do not dispute that these teacher association schools offer the children surplus opportunities. Preventing the emergence of surplus opportunities is justified only in the event that the surplus is realized to the overall detriment of others. This, however, presumes acknowledgment of the fact that local schools financed with public funds cannot provide their students--due to their weak level of knowledge--with even the minimum chances of earning a living.

And it may be that there is something to this. But the association schools would have not a negative but actually a positive impact on the local schools: the councils would have more money to pay the teachers, i.e., the teachers would be compelled to work less overtime, and perhaps the degree of their overfatigue would be reduced. Moreover, the better school is an attracting force. (Here the ax-blade theory can be addressed. The association schools, since their existence is in the direct financial interest of their teachers, would take much more scrupulous care than at present not to provide a surface for attack: if anywhere, then here the subject matter which the law prescribes--and only that subject matter--would be taught. But here perhaps it would also be taught.)

The basic concern is that there is no more money, nor is there more money for paying the teachers. On the other hand, without an immediate and radical increase in the number of teachers, not only is it impossible to improve the opportunities for further education but even a swift deterioration cannot be prevented. The utilization of the inhabitants' financial strength and the prospect of a monthly income of 10,000 forints would obviously bring a lot of persons with teaching credentials back into the schools.

Many good secondary schools are necessary because otherwise there will occur what the plans for "carrying off" the demographic wave consider proper: perhaps voicing anger, perhaps uttering profanities, the majority of those who finish the eighth grade will enroll in the vocational training institutions.

And this is a very big problem. Aside from the fact that many talents would go to waste and aside from the fact that this seemingly very large age class--together with those 1 or 2 years younger--would have to support many more pensioners, in short, its skillfulness (its productivity) would have to be much greater, aside from all this, I ask: if this swarm of children enrolls in the vocational training institutions, what will we do with so many unemployed skilled workers 3 years from now? After all, unemployment within the factory gates is already enormous.

The more secondary schools we have, the fewer teachers there are who have no job or who are compelled to seek another career, provided that it is possible to obtain a salary acceptable by today's standards.

The more secondary schools there are, the more time we gain. The majority of children from high schools will try to get into institutions of higher education: another 4-6 years. Provided, of course, that the number of those admitted is not kept at a ridiculously low level. It is written in an essay analyzing the prospects for admission that "the present situation of advanced learning unequivocally contributes to the rigidification and conservatization of our society." Nevertheless, an economic upswing and a society's conservative shift can only be encountered in shades of militarization.

The solution to the problem of the age group now entering secondary school is valuable as a model. Only with respect to its essence, naturally, is the lesson valid for the economy or for all the other sectors of society. Perhaps the lesson could be formulated thus: today our society's problems can only be solved by broader and broader freedom which mobilizes human capacities to an increasing degree. And human freedom can assert itself in society only if society does not shrink from taking expedient measures, only if society wants to assert freedom, not the watchwords of freedom. Solving the livelihood problems of the demographic wave generation through emigration is to be avoided. Those valves and taps must be found through which the fresh air of freedom can reach, more swiftly than at present, society, education, and the economy. This is not a disavowal but rather a confirmation of process control as applied science.

POLITICS HUNGARY

EUROPEAN 'PEN' TO MEET IN BUDAPEST IN SEPTEMBER

Budapest MAGYAR NEMZET in Hungarian 22 Jan 86 p 5

[Interview with Istvan Bart, Chief Secretary of Hungarian PEN Club, Writer and Translator by Jozsa: "To Protect Writers" Solidarity; About PEN's World Congress"]

[Text] The PEN Club was born as a peace organization more than 6 decades ago. Writers joined its ranks in 1921, shortly after World War I, and the charter created then faithfully reflects the fact that it was written in a Europe divided into conquerors and conquered. Since then PEN has been trying to adhere to the principle of unity between world and national literatures and writers' solidarity. The only world organization at the present time for writers held its annual congress in New York last week. The Hungarian PEN Club was respresented by its chief secretary, Istvan Bart, writer and translator.

Writers from all corners of the world have gathered for the 48th time--says Istvan Bart--about 700, with giants among them like Abe Kobo, Norman Mailer, Claude Simor, Vang Meng, Guenter Grass, Hans Magnus Enzensberger, Sven Delblanc, Mario Soldati, Susan Sontag, E. L. Doctorow, Saul Bellow, Kurt Vonnegut, William Styron, Bernard Malamud, Ryszard Kapuscinski, Isabel Allende, Alan Ginsberg and Vasco Popa. The conference was held at two levels: the official conference, conducted by the executive committee of PEN, was held in the St. Moritz Hotel behind closed doors, with each member organization represented by one, or maximum two individuals, while in the adjacent hotel and several other places there was a fantastic wealth of supplementary activities. Morning, noon and night readings were given for the attending poets, writers, and public as well, as so-called round table conferences were held in which 4 or 5 writers read their 5-10-minute essays on predetermined topics, usually followed by debates, before an audience of 200-250, comprised of American PEN members. Among other topics, one topic emerged this year that was particularly difficult to define and interpret, and indeed it embarrassed the majority of the speakers. Its title was: "The Image of the State, and the Image of the Writer." Two-to-three round table conferences were scheduled for this subject, and Pierre Trudeau and Bruno Kreisky were invited to attend the last one. But aside from this, the program's subjects were extremely varied, debates were held about the state of artistic translations, women writers and women's literature, the state of national identity, and much more. Sometimes we witnessed noisy scenes, Norman Mailer, for instance, got into the crossfire of angry accusations by women writers, and the mildest description he received was "male chauvinistic pig."

[Question] I assume the closed meeting of the official congress was less dramatic.

[Answer] So much so that American newspapers and press agencies reported strictly the public events in the belief that those were the PEN congress. The executive committee and PEN Club delegates discussed issues that were totally independent and different from the above. We discussed the internal matters of the organization, among them financial matters, of course, and the issue of our ties to UNESCO, since PEN receives considerable subsidies from UNESCO. Pert Wastberg, Swedish writer resigned his post of international chairman, and the congress unanimously elected Francis King, English novelist and short story writer, who, as a member of the British delegation came to Budapest recently to attend a cultural forum. Partly due to the presence of Nadine Gordimer, international co-chairman of PEN, the most interest focused on the situation of South African writers, but much attention was given to the circumstances of Philippine writers, the activities of the underground PEN in Turkey, the possibility of estalbishing a Turkish PEN Club in exile, the harrassment suffered by Puerto Rican writers from the FBI, the imprisonment in Iran of a French journalist, and much more. The international PEN brought a resolution to ask the government of Great Britain to re-examine its decision to withdraw from UNESCO. The executive committee is establishing a fund to assist persecuted writers. The general assembly unanimously condemned the violation of cultural rights of minorities. A recommendation was made to establish a Jordanian and a Guatemalan PEN Club in exile.

[Question] The Program and Translation Committee of the International PEN Club has a Hungarian chairman, Ivan Boldizsar. Did this committee have a session in New York?

[Answer] It had its most interesting session so far together with the translation committee of the American PEN. Unfortunately, Ivan Boldizsar could not participate. We submitted a theoretical declaration to the meeting of the executive committee, to set up ethical rules for publishers and translators. Our lengthy debates reflected the chaotic conditions in the world for translations. In several countries artistic translators live and work unbelievably defenselessly. Copyright issues are not resolved. The sample contracts we recommend are only going to improve the situation if they are going to be implemented, and we do not have any illusions.

[Question] The press reported that the International PEN Club plans to have a European regional conference in September in Budapest.

[Answer] The host is going to be the Hungarian PEN Club, just as the Hungarian government was the host of the cultural forum. The goal of the meeting, to be subsidized by UNESCO, is to disucss the recommendations submitted in the literature workshop of the Budapest cultural forum, as several of them are of interest to the International PEN. We would primarily like to bring up the most important Hungarian suggestion at the forum; we are going to recommend that this regional PEN conference put on its agenda the issue of disseminating lesser known European cultures and languages, and this, of course, fits into the larger issue of literary cooperation in Europe. Incidentally--to return to New York for a moment--M'Bow, the chief director of UNESCO, also participated at the congress, and after his speech, answering a question, assured the regional conference in Budapest of his support.

NEW 'SECRETARY OF STATE' POSITIONS IN VARIOUS AGENCIES

Warsaw MONITOR POLSKI in Polish 6 Dec 85 item 245 p 439

["Resolution No 177 of the Council of Ministers of 15 November 1985 on Establishing the Post of Secretary of State in Some Agencies of State Administration"]

[Text] With a view to ensuring integrated implementation of priority goals of special social or economic significance, the Council of Ministers decrees the following on the basis of Article 11, paragraph 1 of the law of 12 November 1985 on changes in the organization and scope of responsibilities of certain main and central organs of state administration (DZIENNIK USTAW No 50, item 262):

Article 1: The post of the secretary of state is established in the following agencies of state administration:

1) in the Ministry of Construction, Spatial and Communal Economy--with responsibilities for the development of materials production for construction and communal economy,

2) in the Ministry of Finance--with responsibilities for the financial systems of the units of socialized economy, price policy and financial planning and auditing in these units,

3) in the Ministry of Agriculture, Forestry and the Food Economy--with responsibilities for forestry, timber management and forestation,

4) in the Chancery of the Council of Ministers--with responsibilities for the structure, methods of operation and cadre management in state administration as well as the oversight of the local organs of state administration.

Article 2.1. In ministries where the post of secretary of state is introduced the latter discharges the responsibilities of the first deputy minister.

2. The scope of responsibilities of the secretary of state is outlined in the statute of the ministry.

Article 3. The resolution takes effect on the day of publication.

Chairman of the Council of Ministers: Z. Messner

RESOLUTION ON CITIZEN OVERSIGHT COUNCILS FOR UNIVERSITIES

Warsaw MONITOR POLSKI in Polish 6 Dec 85 item 243 pp 437-438

["Resolution of the Council of State of 30 November 1985 on the Scope and Mode of Operation of Citizen Oversight Councils of Universities"]

[Text] On the basis of article 5 paragraph 3 of the law of 4 May 1982 on university education (DZIENNIK USTAW 1985, No 42, item 201) the Council of State decrees the following:

Article 1.1. Citizen oversight councils, henceforth referred to as "citizen councils," set up by resolution of a relevant provincial national council and operating on all or individual university campuses situated in the province work to establish a closer bond between universities and the public as well as the economy and culture of the region in accordance with the guidelines laid down in the present resolution.

2. An appropriate provincial national council setting up a citizen oversight committee for universities should reach an understanding with the provincial national councils interested in its activity, especially if organizational units of the university in question operate on their territory.

Article 2.1 Specifically, the following fall in the scope of activities of the citizen councils:

1) analyzing the state of university education, its needs and opportunities for its development in the region, and contributing the views and requests in this matter to the socio-eocnomic and spatial plans and budgets of national councils;

2) carrying out social control and evaluating the operation of universities, especially the discharge of their responsibilities in upbringing in accordance with the constitutional principles of the socialist state;

3) taking measures aimed at organizing assistance to the universities in improving their base of assets and at encouraging enterprises to this end;

4) indicating the problems of significance to the region, initiating R&D activities and practical actions by the universities as well as suggesting avenues of development for this research, scientific-technical progress and training of cadres meeting directly the socio-economic and cultural needs;

5) advancing views and suggestions as to the use of the R&D potential of the universities for the purposes referred to in point 4 and initiating the actions by universities with a view to using in practice the results of their R&D work as well as in the field of efficient management and proper use of the assets of universities, including that for non-scientific purposes;

6) promoting and developing direct ties with the community at large, including especially other colleges, social organizations and enterprises as well as offering opportunities for mutual service and comprehensive cooperation;

7) initiating activities by the organs of state administration which enable university graduates to obtain employment commensurate with their qualifications.

2. In meeting the goals set in paragraph 1, the citizen councils make use of information, reports and studies provided at their request by the presidents of universities as well as those prepared by the organs of the provincial national council.

Article 3. While meeting the goals outlined by the provisions of article 2, the citizen councils adopt opinions and recommendations which are submitted to the relevant provincial national councils and organs of state administration as well as the universities.

Article 4. The citizen councils are nominated for the duration of the terms of provincial national councils.

Article 5.1. The number of members of the citizen council should be commensurate with its areas of responsibility but should not exceed 30 persons.

2. The chairman and members of the citizen council are nominated and recalled by the provincial national council at the request of the presidium of the latter council.

3. The citizen council elects a presidium, which consists of the deputy chairman and secretary along with the chairman.

4. The chairman of the citizen council manages the work of the council and calls its meetings.

5. Relevant university presidents are invited to take part in the meetings of the council.

Article 6. Before the end of November of every year, citizen councils report to the presidium of the relevant provincial national council on their activity and on using the reviews and implementing the recommendations referred to in article 3.

Article 7. Citizen councils adopt their statutes detailing their operation procedures.

Article 8.1. The office of the provincial national council which has nominated the citizen council renders organizational and technical support to the latter.

2. Members of the citizen council residing outside its venue are entitled to allowances for the time spent in meetings or carrying out their assigned responsibilities outside the place of residence and to a refund of travel expenses in accordance with the guidelines for the employees of state administration.

3. Outlays entailed by the operation of citizen councils are financed from the budget of the relevant provincial national council.

Article 9. The resolution takes effect on the day of publication.

For the Chairman of the Council of State: T. Mlynczak

REVIEWER ADVOCATES ECONOMIC STABILITY BEFORE 'DEMOCRATIZATION'

Warsaw PRAWO I ZYCIE in Polish 14 Sep 85 p 11

[Article by Kazimierz Z. Sowa: "The Crisis and Society"]

[Text] Problems relating to the economic, social and political crisis, which began to trouble Polish sociologists even before August 1980 and which almost fully engulfed the science of sociology during the Sixth Congress of Sociologists in Lodz (September 1981), are now no longer as popular among sociologists. This is seen in the topics of new research as well as in the definite decline in attendance at scientific meetings at which papers dealing with the crisis are being delivered. (Incidentally, noninstitutional, union forms of scientific activity in recent years--at least in the social sciences--are total disappearing.) The reasons for this state of affairs are a separate problem.

But recently books are appearing (and this is because of the abnormally long publishing cycle in our country) which pertain to or were written during the severe phase of the 1980-1982 crisis. Unquestionably the impressive volume published recently by Warsaw University under the title "The Polish Society During the Crisis," is one of them. The work was done in the Sociological Studies Methodology Department of Warsaw University, directed by Prof Stefan Nowak, as part of the research on the problem, "Economic, Social and Political Mechanisms for Shaping and Satisfying Human Needs," and stems from the conference in Grzegorzewice which was held in December 1982. The subject of the conference was "The Polish Society During the Profound Crisis; Transformations, Awarenesses and Behavioral Variants." Because of the small number of copies printed and its unavailability on the market, we are reviewing the book here.

The volume, in addition to the introduction by Stefan Nowak, consists of nine chapters--papers delivered at the above-mentioned conference, written by 10 authors, young people and even very young people, drawn together around Stefan Nowak. The only exception is the first chapter, titled "Changes in the Level and Structure of Consumption and the Degree of Satisfaction and Deprivation of Basic Needs," written by an economist outside the University, Zygmunt Zekonski. It is supposed to constitute an "objective" background to the analyses of the values and attitudes of Polish society at the turn of the 1970's in the work being done.

The text, or rather the problems dealt with in the following chapters, are as follows: Living Situations as Stress Factors (Anna Titkow); Changes in the Perception of Social Divisions (Magdalena Gadomska); The Social System of the 1970's (Ireneusz Krzeminski); Collective-Awareness Shaping Processes During 1976-1980 (Grzegorz Bakuniak and Krzysztof Nowak); Changing Values of Polish Youth (Antoni Sulek); Social Awareness During the Crisis as Revealed in Diaries (Anna Giza); The Identification Crisis in the Perspective of Everyday Life (Krzysztof Nowak); Factors in Interpersonal Solidarity and Mutual Assistance (Iwona Jakubowska). The book ends with an extensive essay by Stefan Nowak; its title seems to sum up the entire volume: "Attitudes, Values and Aspirations of Polish Society. Premises for Forecasting in the Light of Changes Already Made." There is also a note about the authors at the end of the volume. The text of the book, in view of its character (a collection of papers) is so abundant and diverse that it would take a large number of pages to discuss it honestly and adequately. That is why I cannot attempt to do so here.

The book, as I have already said, pertains to the subjective side of social reality, i.e., the world of people's convictions, values and strivings. The authors realize the limitations of such a perspective in the study of social life, but they are also aware of its importance in the process of social change and its usefulness in sociological research. Stefan Nowak, in his introduction, described this as follows: "It became evident during the last few years (...) that long-underestimated attitudes, strivings and aspirations of a multimillion nation are able to make themselves loudly known, and sometimes even as one voice, which means that when one wants to explain history as well as when one wants to make it, the events in this area must not be forgotten (...). I think that personal beliefs, feelings of frustration or satisfaction, the conviction of masses of people that the society around them is changing for better or worse, is also an important criterion for the sociologist as to what is happening in that society or to that society. Thus giving evidence of these human feelings and social opinions is an important task for a researcher in the study of people as well as the societies that they comprise. This applies equally to those phases in society's history when they enter a crisis, or when a crisis becomes deeper. That is why, although we are aware of the limitations of the perspective applied in this volume, we still believe it to be important."

However, several pages later, in the first paragraph of the essay ending the book, Nowak writes: "There are (...) moments in the history of particular social systems when attitudes, values and human aspirations become especially important. The method of functioning, and sometimes the form and actually the ability of the social system to function relatively efficiently, depends on them, at least partially. I have a feeling that I am writing this essay in just such a period of history, hence the special role of the problems raised in it."

The justification for the choice of subject, contained in the first quote taken from the introduction, is undoubtedly valid and convincing. On the other hand, his "strong" version presented in the second quote may arouse reservations. The statement that the form or functioning of a social system may depend on attitudes, values and aspirations may be true only in the sense that the statement that a flood is the consequence of the overflow of water over a dam or other flood-prevention means is true.

But here I am arguing more with the unfortunate choice of some of the wording or some of the research assumptions than with the substance of the book. Nowak, as well as other authors, definitely go beyond the problems of values and attitudes, searching in many places for the real and underlying causes and mechanisms of the crisis, and also the present state of Polish society. A particularly valuable feature of Stefan Nowak's essay, quite rare with this consummate scholar, is the examination, in a historical perspective, of our entire 40-year postwar history. It would have been extremely interesting had the author found a similarity to the events analyzed by him to much earlier periods of our national history.

On the other hand, it is difficult for me to agree with the main thesis or the practical postulate of this extremely interesting work by the editor of the volume. For example, Nowak says this, more or less: The economic crisis in Poland is so lasting and so deep that there is no reason to expect a quick and significant improvement in our economy. Therefore, we must establish compensation mechanisms to relieve social frustrations, based on--tout court--a distinct and meaningful democratization of social life. However, my view on this issue is completely different. I believe that the slogan "no bread without freedom" is a beautifully expressed, abstractionally valid--within European culture--moral idea, which should be the compass of human striving over the long historical perspective. But I see no practical application for the idea "freedom without bread." Furthermore, I believe that going in this direction would lead, under the present circumstances, not only to social anomy, but to annihilation or at least to another great national catastrophe.

That is why I believe that we should first of all strive--and this is a suggestion to all Poles--to improve the economic situation, and that matters such as increased freedom or "democratization" should be regarded as a future, or strategic goal. Despite appearances, economic changes may occur in the "short phase" and we could come out of the economic crisis faster than we thought--assuming, of course, that the main criterion for introducing changes will be management efficiency (it does not matter whether the cat is black or white, but that he catches mice--Teng Siao-Ping). And on this front--I use this military term deliberately--the relentless battle should be fought, for the battle is for our "to be or not to be" in Europe.

The alternative or even a discussion on democratization versus economic reform applies to specific Polish conditions in 1985 and is not some kind of general directive or rule for social development. That is obvious and there is no reason to justify it further. But sometimes, in individual as well as collective life, we must give up something, even something very important, in order to attain that which at a given time is of the utmost importance, something which may determine our further existence. Many national misfortunes have befallen Poles because they did not know how to give up something which at that moment in history was unattainable and not of the utmost importance.

And finally the last comment on this interesting volume from the researchers of Warsaw University. This work shows, and in any case allows us to believe, that the values and attitudes of the authors themselves had a certain influence on the picture of reality presented by them. This is not a work written sine ira et studio: traces of "irae" are quite evident in it. This is not an accusation. A scholar has the right to his own value-conditioned interpretation of the reality under study. Anyway Marx, and not just he, said that "objective knowledge"--in the case of the social sciences--does not exist. At least some of the authors of this volume are aware of these conditions and limitations. Antoni Sulek, in his very interesting chapter on the changing values of Polish youth expressed this beautifully. The conclusion of his article applies, in my opinion, to the entire volume. We will quote in its its entirety

"(...) it is possible that this work reveals (not only) the values of the youth being described but (also) the values of the author himself. This does not stem from any lack of respect for the author of the Werturteilfreiheit (underscored) postulate, but from somewhere else--from the fact that the author takes a specific value position on the subject of this work. Such a position, as methodologists teach, may also influence the selection and interpretation of material, that the study furnishes only a pseudoconfirmation of the researcher's preconceptions. It is possible, therefore, that the author happened only upon those studies whose results were compatible with his own preconceptions, that he made a biased interpretation of results which were susceptible to various interpretations, that during the course of an unsystematic reading of newspapers he gave more attention to facts which were compatible, rather than incompatible, with his own hypotheses, that he projected the results of observations of his surroundings, or even worse, his opinions and values, on the people he was writing about. Therefore, it is also possible that a researcher of a another axiology, with a stronger methodological superego, with access to materials not available to the general public and the author, or to circles unknown to him, would arrive at another picture of the changing values of Polish youth. The author would be curious to see such an undertaking." And I can only add: so would the person writing this.

It is too bad, therefore, that the book appeared in such a small edition and will not be able to be the subject of broader scientific as well as social discussion. In any case, it should become the object of keen attention by interested scientists and those who are making decisions on Poland's present and future.

"The Polish Society During the Crisis." Collected Works, Stefan Nowak, editor, University of Warsaw, Institute of Sociology. Warsaw, 1984, 468 pp. (the book appeared in February 1985).

POLITICS POLAND

CRITIC QUESTIONS DEFINITION OF 'NORMALIZATION'

Warsaw POLITYKA in Polish 26 Oct 85 p 16

[Text] The elections to the Sejm, held on 13 October, are regarded by everyone, both here and abroad, as the next step in the normalization of conditions in Poland. The differences, and there is no point in concealing them, pertain only to how these election results are interpreted. There are some, those who are the most optimistic, who say that the results indicate overwhelming support for the government's political line; therefore they assume that the participation in the elections stems from a rebirth of social activism. The unfavorable comments suggest that participation in the elections was, to an overwhelming degree, based precisely on passivism; that is, on the fact that people are tired and have reconciled themselves to things as they are. Of course, I am ignoring the opinions of those who believe that the participation in the elections was the result of mass pressure and terror, because heaven knows there is no way in which 78 percent of the adult, enfranchised citizens of our country could be terrorized; our postwar history has shown many times how highly impossible this would be. In any case, these elections results, which are genuinely in agreement with the personal observations of every one of us (because, after all, about 8 out of every ten people we know went out and voted) are, and should be, as had been said, a portend of normalization.

But from this very perspective we should stop and think about what the word "normalization" really means, because it is a term which we use a great deal but examine rarely.

I think that for most users of this word it means mostly the absence of a distinct atmosphere of political confrontation, expressed also in street demonstrations and skirmishes. That is what we imagined normalization to be in 1982, or even in 1983, when we saw public calm as its first condition. Of course, this criterion, undoubtedly a correct one, applies mainly to our peculiar Polish political customs, for in most Western countries--France, England or West Germany--there is no need to explain street skirmishes for they are not unusual, and no one says that there is an absence of normalization because they take occur in Frankfurt, for example, or Paris.

But in our country such outside events were supposed to mean that there is some kind of self-styled, savage clique in authority while the nation, underneath, is boiling and erupting like a volcano. The elections, I believe, changed that point of view. Normalization is seen throughout the world as a state in which, despite the fact that various groups express their dissatisfaction with the existing state of affairs more or less energetically, people and groups exercising authority do so with the support or at least the acquiescence of the majority of society. I think, in the light of the elections, that we have reached just such a state.

But we should not be so naive as to not realize that for some circles "normalization" means that everything can be as it was formerly. According to these people, the "normal" state was that which led, from time to time, to recurring social and economic crises and desperate conflicts, while any move aimed at questioning or changing this state is "abnormal. According to the declarations accompanying the entire elections campaign, the election results should be deservedly disillusioning to all of the advocates of this concept of normalization.

But these deputies, if they want normalization and want to continue to strengthen it, must, just as we all, stop and think for a moment: what really is now normal in our life and what is profoundly abnormal? In fact, the entire continuation of this process called normalization depends on the answer to this question.

For example, is it normal in a society as diverse as ours for there to be so many viewpoints on social and political issues, and even on our political system?

Certainly it is, and I cannot imagine that this normalcy could be questioned within the framework of any kind of normalization.

But since it is so, is it normal for the differences that really exist to be expressed publicly, in our social life, in the press, and in the Sejm?

I think yes, and that it would be truly abnormal if there were a choir of voices all singing the same tune. Of course, here too, we should add that normalcy also means expressing this diversity within the limits established by the constitution, or--in order not to reach so high--by the binding right of the press, which during the process of normalization should be applied in all of its sections.

The most normal thing in the world is the right to broad contacts with the outside world--contacts abroad, both official and private. Our 20th century is such that that which was once a secondary matter now moves to first place among human needs. I think that in this respect we came very close to normalcy during the late 1970's and that a certain limitation here (for example, the need to obtain often very questionable "invitations" from abroad when personal foreign travel is financed out of one's own funds) moves us away from normalcy rather than brings us closer. The right to a passport is normal. The absence of this right is a deviation from the norm.

Despite the fact that foreign broadcasts and foreign commentators see these things differently and constantly apply police-state criteria to Poland, a country locked and gagged--which, with time, becomes really exasperating--we see many more abnormal things not in the area of personal rights and freedoms but in the economy.

For example, it does not seem to me to be normal that in a European country at the end of the 20th century a system of rationing should exist into infinity. We have become accustomed to ration cards. Sometimes we have even learned to like them, because one can learn to like anything given enough time and proximity, but this is not normal. I think (perhaps too optimistically) that during the term of the present Sejm this abnormality should disappear, provided, of course, that we do not want to accept it as something that is normal.

But in the opinion of the public, the disparity, or really the total incongruence of prices and wages is an even greater abnormality than the rationing system. I am not talking here about speculation, of course, but about official, state prices. Let us tell the truth: we are living in conditions where almost every purchase except for our daily staples--bread, cheese, potatoes, etc.--arouses immediate suspicion of highly sophisticated swindles and embezzlements on the part of the purchaser. I am not saying that that is how these suspicions arise, however I am saying that in the light of bald statistics this whole thing looks absurd. Out of what kinds of incomes are people buying suites of furniture in state stores for 300,000 or 400,000 zlotys? Out of what kinds of incomes are they buying color television sets costing over 100,000 zlotys? Or automobiles for a million zlotys? There is no mathematician who could account for this on the basis of our official wages and salary system, and that is what seems to me to be profoundly abnormal.

What am I asking for here? That more money be printed so that the price agree with the wage? That prices be reduced so that it is not profitable to produce? That profit margins be reduced so that it would not be profitable to sell? All of these nonsenses have already been applied and, of course, they have not produced results. Nor am I an advocate of a system in which everything is for everyone. There are, and should be, goods which will be accessible only to those who earn more, or really much more. But in this case I would like to be able to completely calmly, applying all principles of mathematics, calculate how Mr X, a full member of the Academy of Sciences, Mr Y, the managing director of a huge combine, or Mr Z, a skilled journeyman working in accordance with all of the regulations of reform, can afford to buy furniture, a television set, or an automobile, while also maintaining a family, eating three times a day and buying new shoes every once in a while. The ability to make such a calculation would, in my opinion, be normal and more invigorating to me than Minister Nieckarz's fiscal acrobatics.

It would also be much more normal if within the framework of normalization the regulations governing such a fundamental right in the life of every society as the right to ownership could take on a degree of permanence. This right is really devilishly simple and is based on the premise that what I have purchased is my property, and that what is my property I can sell, give away, or even lose. There is nothing else in this law and even a child can learn this. But please apply its crystal clarity to the housing situation, for example, when not too long ago we were being encouraged to buy state-controlled and cooperative housing and such purchases were made easier for us. This property was to be ours, but now try to sell this unquestioned ownership; I have already seen a couple of people who have turned gray while trying to do so. Please apply the ordinary logic of the right of ownership to the actions of the private sector in the economy, where fiscal and property regulations change in kaleidoscopic fashion, or to those already famous "Polonia firms," of which a good percent--and I suspect particularly those who did not get used to the ups-and-downs and swindles--are now leaving Poland, and we will see how simple things become distorted through improper use.

We are now entering a stage of normalization. Logically this should mean that we will be surrounded by more normality and less abnormality. Sometimes we do not even realize how ambitious this concept is.

BRIEFS

SD TERRITORIAL SELF-MANAGEMENT MEETING--A review of the way the bill about the system of national councils and territorial self-management was being put into effect in Konin Province was the subject of the conference of the councilmen-members of the Democratic Party and the SK aktiv of the voivodship. Tadeusz Witold Mlynczak, chairman of the CK SD, deputy chairman of the State Council, took part in the meeting. He acquainted the participants with the State Council's resolutions about the current functioning of that bill and suggested future tasks for the councilmen and the SK aktiv, which when realized, should contribute to further democratization of life in that province and better implementation of the bill. [Text] [Warsaw ZYCIE WARSZAWY in Polish 5 Dec 85 p 2] 12470/12232

PRON ORGANIZATION MEETING--At a meeting in Lodz of the PRON activists of the Baluty District, it was debated how should the basic PRON units develop, what is the main direction that their activity should take and how to avoid schematization at work. The general secretary of RK PRON, Jerzy Jaskiernia, who participated in the meeting, pointed out the necessity of planning new methods for PRON work that are more appropriate to the ongoing normalization of life in the country, the changing general conditions, change in the priorities of the people's needs and expectations. Our task he stated, is to work out such methods of action as will answer the needs of the second half of the decade of the 1980's. [Text] [Warsaw ZYCIE WARSZAWY in Polish 5 Dec 85 p 2] 12470/12232

MILITARY AGITPROP SESSION--A session of the aktiv of propaganda and campaigning of the Armed Forces PRL took place in Warsaw, at which they summarized the results of a year of political schooling and evaluated the propaganda and campaigning activities of last year. They stressed the importance of those activities for perfecting the process of education, strengthening the moral-political condition, improving discipline and battle readiness of the military force. The main goals and tasks for 1986 were defined. The leading officers-activists in the field of propaganda and campaigning received diplomas and awards. General Leslaw Wojtasik, deputy chief of the Main Political Directorate, Polish Army, took part in the meeting. [Text] [Warsaw ZYCIE WARSZAWY in Polish 5 Dec 85 p 2] 12470/12232

PARTY CUSTOMS ADMINISTRATORS CONFER--In Warsaw a conference took place of the party managerial aktiv of the customs administration for the purpose of evaluating the work of that service in the past year. Among others there was a discussion about streamlining the work of the customs offices in their processing of people and goods and also about combating criminal activities connected with customs duties. [Text] [Warsaw ZYCIE WARSZAWY in Polish 5 Dec 85 p 2] 12470/12232

ZSL CENTRAL AKTIVS MEETING--On 7 December a conference of the central aktiv of ZSL took place in Warsaw devoted to a discussion of the tasks of the party arising from the socio-political situation of the country. A lot of attention was given to the political-organizational activities of ZSL in view of the report campaign in circles and community units of the party which in accordance with the instructions of the Presdiium of NK will last till the end of March 1986. The goals in this area were presented by Bogdan Krolewski, member of the Presidium, NK secretary. Kazimierz Olesiak, member of the Presidium, NK secretary, reported on the socio-economic situation of the villages, including problems connected with realization of the joint agrarian policy of PZPR and ZSL. [Text] [Warsaw RZECZPOSPOLITA in Polish 9 Dec 85 p 5] 12470/12232

PZPR DELEGATION IN ANGOLA--The PZPR delegation to the II Congress MPLA--Labor Party headed by Waldemar Swirgon, secretary KC, was greeted by the chairman of the Angola party and president of the republic, Jose Eduardo dos Santosa. The delegation held talks with the chairman of SWAPO-Liberation organization of Namibia, Sam Nujoma. [Text] [Warsaw RZECZPOSPOLITA in Polish 6 Dec 85 p 7] 12470/12232

ARMY POLITICAL DIRECTORATE IN SFRY--Delegation of the political directorate of the Polish Army headed by the deputy minister of national defense, chairman GZD WP Jozef Baryla, is staying in Yugoslavia since the 3rd of this month. Meetings and discussions between the Polish deputy minister for national defense in Belgrad as well as in Lublana (the capital of Slovania) served to strengthen even further the ties of cooperation between the armed forces of the two friendly nations. [Text] [Warsaw RZECZPOSPOLITA in Polish 6 Dec 85 p 7] 12470/12232

MLYNCZAK IN PRAGUE--An official delegation of the Democratic Party headed by the chairman CK SD, deputy chairman of the State Council PRL Tadeusz Witold Mlynczak arrived in Prague last Thursday, on the invitation of the Central Committee of the Czechoslovakian Socialist Party, In the afternoon plenary discussions took place between the representatives of both parties in the capital city of CzPS. T.W. Mlynczak and the chairman of CK CzPD D. Kuczera presented the political, social and economic situation in the two countries. [Text] [Warsaw RZECZPOSPOLITA in Polish 6 Dec 85 p 7] 12470/12232

OPZZ, TECHNICAL ORGANIZATION COOPERATION--The managements of OPZZ and NOT agreed on a program of cooperation in the areas of: technical development, introduction of the economic reform, bio-technology, safety and humanization of labor. It also covers problems of saivng and protecting the natural environment, protection of professional privileges, raising the ranks of engineers, technicians and foremen, and the protection of their work and living conditions. OPZZ and NOT will cooperate with the political and state authorities in the selection from the engineering-technical cadres of people for managerial positions and they will inspire and support the spirit of creativity and nationality of work. A decision was also made to organize joint teams of specialists to work on expertise, opinions, reports and everything else pertaining to the main problems of socio-economic development and scientific-technical progress in the country. [Text] [Warsaw TRYBUNA LUDU in Polish 3 Dec 85 p 5] 12470/12232

WALBRZYCH DEFENSE COMMITTEE--A conference of the provincial Defense Committee took place in Walbrzych on 2 December. The socio-political situation and security in the voivodship were reviewed, as well as carrying out defense tasks in some units of state administration on the basic level. [Text] [Warsaw TRYBUNA LUDU in Polish 3 Dec 85 p 5] 12470/12232

PRON FOCUS ON YOUTH--At the Warsaw meeting of 3 December between the General Secretary RK PRON Jerzy Jaskiernia and the leaders of youth organizations, there was a discussion about youth's problems which should become the main interest of PRON leadership and problems of youth's participation in the work of the movement. [Text] [Warsaw TRYBUNA LUDU in Polish 4 Dec 85 p 2] 12470/12232

HUNGARIAN SCIENTIFIC-TECHNICAL COOPERATION--On 3 December the Deputy Prime Minister Jozef Koziol held talks with the ambassador of the Hungarian People's Republic on the subject of matters connected with the preliminaries to the 22nd session of the Polish Hungarian Committee for Economic and Scientific-Technological cooperation. [Text] [Warsaw TRYBUNA LUDU in Polish 4 Dec 85 p 5] 12470/12232

AMBASSADOR TO TUNISIA NAMED--On 3 December the ambassador of the PRL in Tunisia, Mieczyslaw Majewski, presented his credentials to the president of Tunisia, Habib Bourguiba. The president expressed great interest in the preparations for the visit to Tunisia of the chairman of the State Council PRL, Wojciech Jaruzelski. Some matters pertaining to Polish-Tunisian relations were discussed. [Text] [Warsaw TRYBUNA LUDU in Polish 4 Dec 85 p 7] 12470/12232

CZECH SCIENTIFIC-TECHNICAL COOPERATION--Last Tuesday the deputy prime minister of CSRS, chairman of the State Committee for the Development of Technology and Investments, Jaroslaw Obzina, received the minister of mines and heavy industry, Janusz Maciejewicz, who was in Prague on a working visit. They discussed opportunities for further growth of specialization and coordination of production as well as closer scientific-technical cooperation. [Text] [Warsaw TRYBUNA LUDU in Polish 4 Dec 85 p 7] 12470/12232

GERTYCH, YOUTH REPS MEET--On 5 December Zbigniew Gertych, deputy prime minister, received representatives of the leadership of ZG ZSMP, headed by Chairman Jerzy Szmajdzinski. They submitted the general direction of the activity of ZSMP and its goals for the next couple of years. The deputy prime minister thanked the aktiv and members of ZSMP for their past work. Aleksander Kwasniewski, the minister of youth affairs, took part in the meeting. [Text] [Warsaw TRYBUNA LUDU in Polish 6 Dec 85 p 2] 12470/12232

YOUTH ORGANIZATION, JUSTICE OFFICIALS MEET--On 5 December a meeting took place between the representatives of the leadership of the Department of Justice and the ZG ZSMP with the participation of Minister L. Domerecki and Chairman ZG J. Szmajdzinski. They discussed problems of cooperation between the Justice

Department and ZSMP in the area of realization of common tasks. Particular emphasis was put on the program of educating the people in the state-laws area, which was accepted by the Political Bureau KC PZPR. In view of the emergence of many new problems demanding joint solutions, forms of cooperation were worked out for the next future and appropriate agreements were signed. [Text] [Warsaw TRYBUNA LUDU in Polish 6 Dec 85 p 2] 12470/12232

RURAL YOUTH UNION SESSION--On 3 December a regional convention of the Rural Youth Union 'Wici' took place in Kolbuszowa inaugurating the report-election ZMW camapign in the Rzeszow Province. Of the 6.5,000 members of the voivodship's youth organization the ones in Kolbuszowa region are the most active. A number of main problems bothering rural youth were discussed. Chairman of the state board ZMW Leszek Lesniak, who participated in the convention, summarized and concluded the discussions. [Text] [Warsaw TRYBUNA LUDU in Polish 6 Dec 85 p 2] 12470/12232

IRAQ FRIENDSHIP ORGANIZATION VISITS--On the invitation of the Society for Nations' Friendship and the Society for Polish-Iraq Friendship a delegation of the Society for Iraq-Polish Friendship visited in our country 29 November till 6 December. It was headed by the chairman of the organization, who at the same time is the general secretary of the Association of Iraq's journalists, Sabah Yasehem. During the meeting with the board members of the Association for Polish-Iraq Friendship, there was a discussion of realization of the agreement on cooperation between the two organizations and plans for the next few years. Members of the Iraqi delegation also held talks with MSZ, National Council PRON, ZG SD PRL at the capital's town hall. Deputy Foreign Minister Jan Majewski received the delegates. They emphasized the role of the friendship Associations in bringing about strengthening the cooperation between Poland and Iraw. The ambassador of Iraq, Himet A. Sattar Hussein, took part in the meeting. [Text] [Warsaw TRYBUNA LUDU in Polish 7-8 Dec 85 p 2] 12470/12232

MINISTER, FRG JOUNRALISTS MEET--Minister of Foreign Affairs Marian Orzechowski and the deputy minister of this department, Ernest Kurza, met with a group of West German jounralists visiting in Poland on the occasion of the 15th anniversary of signing the agreement between PRL and RFN. The host of the meeting was the chairman of the Club of International Journalism SD PRL, Marian Pokdowinski. [Text] [Warsaw TRYBUNA LUDU in Polish 9 Dec 85 p 5] 12470/12232

NEGLIGENCE OF PARTY ORGANS BLAMED FOR MEMBERS' TRANSGRESSIONS

Bucharest MUNCA DE PARTID in Romanian Nov 85 pp 89-90

[Article: "Grave Violations Receive Slaps On the Wrists"]

[Text] Induction into the party is an act of solemn responsibility which must be viewed as such both by party organs and organizations as well as by those requesting that induction. We draw attention again to these basic requirements because, unfortunately, there are still those who pay them no mind. This is the conclusion one draws from events that took place in the local party organization in the village of Corbu, Corbu township, Hargita county. Here, in 1983, there was a discussion about granting party membership to Sabina Cazan. This discussion should have been based, of course, on the provisions of the RCP party statutes of the central committee instructions. These provisions are--or should be--known both by those who approved the application as well as by those who forwarded it, given that no one is accepted into the party until he is well qualified and has mastered the party program and statutes.

However, as was pointed out to us in a letter sent to the editor, such was not the situation in this case. Inquiry by the county committee into the complaint established that a number of the provisions of the statutes and the instructions had been violated, but these violations were discovered well after the fact and only after the abovementioned letter had been received. For these shortcomings, Gheorghe Laurentiu, former Corbu party communal committee secretary and later Tulghes committee secretary was severely censured and removed from his posts of communal committee secretary and community mayor. Virginia Rugina, former deputy secretary for propaganda in the party communal committee was censured. Gavril Tofaleanu, former local party secretary was severely reprimanded. Viorel Surdu who made the recommendation and Viorel Goia, secretary of the community communist youth organization, were formally reprimanded. Simion Rugina, former county instructor who was responsible for supervising and directing the activities of the communal committee in question was given... a reprimand!! The documents admitting the applicant to the party were annulled.

As one can see, the punishments were very mild in some instances. The most curious case is that of Gavril Tofaleanu. He was removed from the posts of local party organization secretary and vice chairman of the Corbu Communal People's Council Executive Committee because he had falsified certain data on the documents that admitted the applicant into the party. Some people--ourselves included--have a serious question: Why after all of this was he promoted and maintained as chairman of the Corbu Production, Purchasing and Marketing Cooperative?

The Truth Will Out

Every person has the right to draw attention to irregularities. Anyone can request the elimination of measures which violate current party or state regulations. However, one must state the facts as they are and not color the truth.

We are afraid that this is not what happened when Dobre Sovailescu from the Coltea Agricultural Production Cooperative, Rosiori township, Braila county, wrote us asking for our assistance in righting an injustice. Sovailescu claimed he had been unjustly accused and fired from the post of party committee secretary at the agricultural production cooperative. In essence he said that an audit at the cooperative had uncovered certain irregularities, that a general meeting of all members of the cooperative had been called to review the situation, that on the day the general meeting was to be held, the party committee and leadership council met in advance of that meeting and that, as luck would have it, on the same day there had been a wedding in the village, and that he had consumed several drinks there. Nonetheless, he said, he appeared at the meeting where to his amazement, he was fired because it was alleged he had written the anonymous letter that brought on the audit.

But look at what the county party committee has written us. "The decision to replace him as secretary of the agricultural cooperative committee was taken because he had arrived drunk at the joint meeting of the party committee and leadership council. This was the meeting where they were to discuss the study's findings on problems stated in the letter of complaint. When they checked into his story no one was able to confirm that he had been at the wedding. At 1900 that evening, when the meeting had been scheduled to begin, the participants awaited his arrival for an hour, until he was found and brought to the meeting in an advanced state of inebriation. There had been no discussion of his being the author of the anonymous letter."

Enough said....

A Case Which Gives Pause for Reflection

Party decisions and state laws have precise stipulations concerning the promotion to a higher position, the collective where the candidate works must be consulted. Proper regard must be given to regulations that require, among other things, that the candidate pass an examination or excel in competition for the socialist order and the needs of the people as well as proper conduct in society and so on.

But a letter has reached us from the Arad Textile Enterprise's sector II finishing section that expresses unhappiness with the promotion of Constantin Gorun to the position of foreman. This person had been expelled from the party in 1983 for theft from the public trust! Furthermore, he had been promoted without any examination or competition! Upon examination of the case, according to a report sent to us by the Arad county party committee, "the enterprise leadership acknowledged that it had erred by not conforming to the rules in promoting this worker." In the end, the promotion was voided, the post declared vacant and an examination was announced to fill it. The case, however, still gives pause for reflection, especially about the motives that caused such important regulations to be "forgotten" by those who are responsible for their application and that caused the party organs and organizations at the enterprise to be negligent regarding this essential aspect.

Where was the Party Organization?

A letter sent from the Constantin Daicoviciu commune in Caras-Severin told us about a situation that was simply hard to believe. The chief at the calcium oxide section was D. Calina, a person of low moral character who, when he had been president of the Fishermen and Hunters' Association of Caransebes, had falsified sales receipts for hunting weapons and pocketed a certain amount of money. He also borrowed money from his subordinates and "forgot" to repay it. Another person in authority there was Aurora S. who had been expelled from the party for forgery and for accumulating an improper amount of money.

Naturally, it was decided to replace the two. But the question remains, "How is it that the party organization did not uncover this on its own?" The answer emerged from a study of the case in question. Not only had there been no heed paid to these matters, but the fact had been overlooked that for sometime this bureau had been understrength with the departure of the secretary and another member. Under such conditions, party activity was carried out in a most unsatisfactory manner. Furthermore, all of this transpired under the indulgent eyes of the party communal committee and of the cadre who over time passed through this unit. For these shortcomings, the communal party secretary was severely... reprimanded. But don't those who have the task to assist the communal committee also share in the guilt?

SHORTCOMINGS OF POLITICAL SCHOOLS FOR YOUTH VIEWED

Zagreb VJESNIK in Serbo-Croatian 1 Dec 85 p 6

[Article by Vesna Perunicic: "Intolerable Production of Mist"]

[Text] Unfortunately, it is necessary to have something happen that is at first glance completely unrelated to the reason for the existence of political schools for youth, in order to startle us, who have been lulled by the form and routine of this type of ideological and political education, and to make us start thinking. That is what happened last spring at the "Ivo Lola Ribar" political school for youth in Belgrade.

Suddenly, when it was necessary to collect the fees, fictitious classes appeared, false lists of students whom no one had ever seen in class. They registered (or someone did it for them), and afterwards every trace of them was lost and they never dreamed of showing up there, even in order to complete the number of students. It was important to the Marxist centers that the organizers collect a sufficient number of names to fill the planned "capacities," and it appears that no one was particularly interested in how this would be done or in what would, after all, attract these individuals.

Are young people really not able to satisfy even part of their interests in political schools? This question does not arise exclusively because of the above-mentioned incident in Belgrade, but also because of the universally accepted observation that these schools are doing badly.

"All of this together is just the production of mist," noted Dragan Mojovic, an editor at the Ivo Lola Ribar Political School for Youth, who was attempting to describe the real state of affairs in the field of ideological work with young people and was not afraid of this generalization. One must begin with an analysis of the instruction programs in regular schools, in which the concept of humanistic education and the moral development of children and youth has been abandoned in favor of pragmatic and utilitarian goals. The excessively high requirements for narrow specializations do not leave room for studying subjects without which the education of a socialist person cannot take place.

Style Imposed by Ignorance

This applies primarily to philosophy, logic, history, literature, and art. In addition to the program that is thus impoverished, there is also another problem -- the teachers. Certainly the nature of the teachers' values and the style of their pedagogical work are governed to a considerable extent by their very poor and low social status. Furthermore, Mojovic says, this teaching staff has been trained for a different style of pedagogical work than is required by the modern self-managing school, and thus it is evident that the schools are resistant to new teaching methods, in the psychological-pedagogical sense. Only a few of the teachers adopt them.

The atmosphere of the school, which hinders the formation of a democratic personality, is another story. The school is a markedly authoritarian institution, as one can observe from the physical organization of the premises and the relationship between the lectern and the benches. The lectern is elevated and separated from the benches (so that one knows which place belongs to whom). Next, one can observe this from the relationship between the student and the instructor, and between the student and the program and methods. As long as schools externally resemble hospitals, barracks, and prisons, and internally there are strict rows of benches with a lectern in front of them, and as long as dictation is given in order to be copied down, schools will be an anti-self-management environment, Mojovic claims.

Under such conditions, one cannot develop a self-managing spirit and personality. Also, as long as the teaching of Marxism in schools does not explain what such an authoritarian system, strict discipline, and the method of evaluation mean for the socialist formation of the personality, it will be a dead teaching for revolutionary education, like that of St. Thomas Aquinas, i.e. anti-Marxism.

Limited programs are necessarily also impoverished ones. For example, what can one expect of students in Kosovo who for years, in the history of music, have studied one Serbian author, two Yugoslav ones, and one from elsewhere in the world, and neglected all of the other ones from Kosovo and Albania? A similar thing also happens with writers: those that are studied most are one's own, the local ones, and so the feeling that these are also the "best" arises by itself, spontaneously. This is probably also the beginning of the arousal of nationalistic feelings, whose manifestation later on we call nationalist outbreaks. Neither critical thought nor logical training in speech is taught in schools. It is easiest to do this indirectly, instead of through an exclusively Marxist education, whose one-sided orientation has even created an attitude of rejection among young people.

Mojovic asks what political schools should represent in these general circumstances, and he gives a very pessimistic answer. Young people who decide to attend a political school usually do not even understand the most elementary concepts of the sciences concerning society, politics, economics, or philosophy that would make it possible to conduct a democratic dialogue with them, which is said to be the most suitable form of work. In political schools, they not only do not know the facts that should prevail in schools, but they do not even have training in speech and democratic dialogue, which implies tolerating different opinions and being able to have a confrontation between arguments and not personalities. Consequently, one cannot accept the criticisms of a political school (especially this one in Belgrade) becoming a school after school, since such a style has been imposed by ignorance. And necessity, as we know, even changes the law, not to mention the customary practice in ideological work with youth, which is not producing any results.

Prejudices as Consequences

This first obstacle is immediately followed by the next one -- the programs in political schools. Mojovic claims that they are imposed by people who conduct conversations with young people without communicating with them, because they are not familiar with the problems of the period of adolescence and of political and cognitive socialization. Then they use the poor response from the students for general observations like "young people are apolitical today."

Recently efforts have been made at the Ivo Lola Ribar school to promote a different kind of education, not imposing programs, but taking into account the desires and needs of young people, and dealing with the subjects more flexibly. Conversations are conducted in small groups of about 20 people regarding religion, nationalism, value orientations, and the free time of young people, all without lectures from the lectern and excessive theoretical explanations. The purpose is to find out through such a conversation what the personal and private attitude of each individual is toward drugs, religion, and Yugoslavia, what their knowledge, mistakes, and prejudices are, and why they adhere to them. When some idea of all this is more or less acquired, it is up to the organizer of political instruction to offer appropriate information, explanations, knowledge, and facts.

Interesting conclusions have been reached in the handling of the problems of national emancipation and nationalism. Young people ask about prejudices, exclusivism, tolerance, and real feelings, and the outcome of the survey, as Mojovic says, can be generalized as a result of climate and situation: young people have little or even completely insufficient knowledge about fundamental concepts like people, nation, and national and nationalistic awareness. They are not capable of recognizing characteristics and indications of such phenomena and changes, and because of all this they are burdened with great prejudices. All of this is once again the consequence of insufficient education and cultural and political isolation.

There is no emotional content of any kind, or hatred, in this, because they want to associate with people outside their own milieu, to encounter new values and cultural contents. But they are usually not allowed to do so because of their material position and the social climate that has imposed restrictions and barriers. This immobility is generally characteristic of secondary school youth and some students. Naturally, no one is born a nationalist, but rather becomes one in specific circumstances and under the influence of the people with whom he associates and has ties.

Steps in Political Education

The nationalist outbreaks from young people that we have witnessed recently are being turned into bureaucratic wrangling in public. Essentially this has to do with an outlet for some accumulated aggression and dissatisfaction with something that has happened, for very diverse reasons. Such behavior easily gets out of control and is directed, for example, against the supporters of a sports team on the other side who are from a different republic. Everything that we are inclined to label as nationalism among youth consists mainly just of occurrences of emotional destruction, Mojovic claims. The causes of this aggression are not hatred of other peoples, but rather various dissatisfactions in school, family, and society. Statistics have shown that the hatred of blacks and whites in the American South culminated in conflicts when the cotton was not growing or when prices for it were low.

From the standpoint of motivation, there is no difference between nationalist escalation, some tumultuous outbreak or conflict, and the cold, scornful view of some individual inspired by nationalism. The difference is only in the social consequences: in the first case political and administrative action is taken. For this reason one should not be one-sided in discriminating against indications and occurrences of nationalist feelings, attitudes, and conduct; instead, one should eliminate all of the circumstances that determine such feelings, attitudes, and conduct. At the same time, with respect to young people, one should make possible a genuine humanist (Marxist) education.

One could talk about the social role, significance, and reputation of political schools much longer than the newspapers will tolerate. Instead of conclusions, one can admit, even though it sounds nostalgic, that these schools are not what they once were. Perhaps they should not even become like that again in all of their aspects, but we would have cause for satisfaction if we succeeded in them in combining the former seriousness and interest of the students with a modern approach and current topics. There would certainly be an effect, and our interlocutor Dragan Mojovic would not be able to assert from such an authoritative position that the present situation in political education is really the production of mist.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

MONTENEGRIN AGRICULTURAL PLANS TO 1991

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 7-9 Dec 85 p 3

[Article by Rade Grujic: "More Food and Jobs"]

[Text] With the implementation of the project for the regional development of agriculture, by 1990 Montenegro would meet its own needs for meat and milk to a very high degree, and the production of early fruits and vegetables would be increased. The employment of members of the families of private producers would increase by about 25 percent, and 800 jobs would be created in the socialized sector.

The beginning of next year should mean a great turning point for agriculture and the agroindustrial complex in Montenegro -- investment worth $100 million. This has to do with the Regional Project for the Development of the Republic's Agriculture and Agroindustrial Complex, which is to be financed with funds from the International Bank for Reconstruction and Development and funds from foreign commercial banks.

The idea for this project was initiated as early as 1981, when the Economic Bureau, an OOUR [basic organization of associated labor] of the Institute for Marketing and Economic Research in Belgrade, began "taking down" the possible investors and the desires cited by the initiator of the project, the republic of Montenegro. After a preinvestment analysis, the FAO in Rome, i.e. its Center for Investments, joined in the project. In the summer of 1982, a report on the justifiability of this project was sent to the International Bank for Reconstruction and Development, where the project met with support, and the value of the loan was estimated at $100 million.

The current situation is such that the loan is to go into effect at the beginning of next year, and in Montenegro a survey is under way, conducted by the Agroeconomic Institute of the "13 July" Combine, in regard to the concrete desires of the private producers and their ability to participate in the project. This is because the basis of this project will be the development of the private sector, where during the next few years 600 mini sheep farms with capacities of 50, 80, and 120 head, in addition to 600 mini cattle farms with capacities of 5 and 10 head, are to be completed, 1,200 pregnant heifers are to be purchased, 2,000 hectares of natural meadows and 560 hectares of unexploited meadows are to be reclaimed, and the production of 600 hectares of silage corn and 280 hectares of artificial meadows is to be established.

In addition to this main part, which in the broadest sense covers the production of meat and milk, by 1990 the project should also achieve the construction of 20 mini fish ponds with capacities of 1,000 square meters and 33 hay farms with capacities of 450 meters, the establishment of a total of 120 hectares of fruit orchards (apples, pears, raspberries, and currants) for 180 private farmers, and also the revitalization of about 60 hectares of olives in the private sector.

The total result of these additional investments in primary production and greater processing of the raw materials would be 8,200 tons of meat on the hoof, 2.9 million liters of milk, and the processing of 0.6 million liters of milk into cheese and 3,600 tons of fruits into semifinished products.

In addition to this, the completion of the project, at full production, should ensure an additional 2,000 tons of meat, 14 million liters of milk, 900 tons of fish, 250 tons of fresh early vegetables, and 5,700 tons of fruit. About 2,400 private farmers would benefit directly from the project, and the employment of family members would increase by about 25 percent. The additional employment in the socialized sector would amount to about 800 permanent jobs.

For now, we know that next year should see the completion of part of the agrocomplex that covers the construction of a cheese factory for high-quality cheese in the area of the Plan opstina, the renovation of a dairy farm in Ivangrad, a slaughterhouse in Bijelo Polje, and a facility for medicinal plants in Risno. The project is planned in such a way that its completion will depend upon the current business conditions, so that if a certain component is not currently economically justified, work will begin on suitable alternatives in accordance with the balance of raw materials available. Since livestock breeding is the heart of the project, it is important to state that the introduction of the intermediate components -- artificial meadows and silage corn -- will cover 70-80 percent of the fodder requirements. So far, the fodder factory in Spuz, for instance, has worked mainly with raw materials purchased in other republics.

The economic justification of this investment, which is not such a small one, is the elimination of the shortage of meat and milk in this republic, and the development of those components of agriculture and the agroindustrial complex in which this republic has comparative advantages. Certain facilities will also be oriented toward exports -- they will export the surplus of slaughtered lambs, high-quality cheese, and medicinal plants, in which the U.S. market is particularly interested. The greatest benefit from the project, however, will be a reduction in the increasingly greater migration from the village to the city, and the possibility of additional employment for family members on private farms, as well as new jobs in the socialized sector.

EXTERNAL FACTORS IN CEMA ECONOMIC DEVELOPMENT VIEWED

Prague ZAHRANICNI OBCHOD in Czech No 12, 1985 pp 8-11

[Article by Ondrej Ler and Ludek Urban: "External Factors in the Economic Development of the European CEMA Countries"]

[Text] The economic development of the European group of CEMA countries during the 1980's was accomplished under the strong influence of external factors. The experiences of the previous decade, mainly those of its second half, showed, among others, that the depth and duration of structural changes in the economy of the world cannot be underestimated. The economic strategy of the CEMA countries for the period 1981-1985 was consequently also based on the assumption that the influence of adverse external economic conditions, which had played a role in slowing down economic growth and in diverting it from planned intentions at the end of the 1970's, would continue through the first half of the 1980's.

Altered External Conditions and Their Effects

Among the external factors which had had an adverse influence upon the course of economic processes in the European countries of CEMA it is necessary to differentiate between two groups: The first originated in the previous time frame; the second did not show up until the 1980's. In the first case, this is primarily a matter of exchange transactions between six of the smaller countries (Bulgaria, Czechoslovakia, Hungary, GDR, Poland, and Romania), which then deteriorated further at the dividing line between the 1970's and 1980's under the influence of a new round of price increases applicable to energy inputs on the world market. This gave rise to far greater requirements for export outputs by these countries. On the other hand, the situation pertaining to the Soviet Union was substantially different because that country is among the leading world exporters of petroleum and natural gas.

During the first years of this decade the pressure exerted by the external economic environment increased contrary to original expectations and a number of new factors emerged. The extraordinarily long economic crisis of the capitalist world (1980-1983) rendered sales in world markets more difficult, revived protectionist tendencies, and, at the same time, revealed the relatively low adaptability of many of the socialist national economies. A sizable limitation of commercial, scientific-technical, and credit relationships between the East and the West, as a component of reprisal measures taken by a number of imperialist states in response to events in Afghanistan and in Poland, placed the task of achieving technical-economic independence from developed capitalist nations in strategically important sectors and branches of the national economy in a short time on the agenda of the day. The rise in interest rates on the world credit market increased the cost of debt services for the socialist countries. In an exacerbated international situation the task of lowering foreign indebtedness with respect to Western banks and governments thus became one of the main priorities of economic policy for a number of socialist countries.

Both from the standpoint of overall results of economic development for European countries of CEMA, as well as from the standpoint of the intensity of the effect of adverse external factors, we can differentiate between two stages in the 1980's: the period 1981-1982 and the period 1983-1984. The effects of adverse circumstances, not only external but also internal, were felt in a most concentrated manner during the first 2 years of the current 5-year plan. It was precisely during this period that the countries of the socialist community of states felt the greatest impact of the world economic crisis connected with many protectionist measures. During this time, they also had to deal with a further rise in prices of imported energy raw materials and with the increased outflow of material assets to foreign countries. During the subsequent period (1983-1984) the economic situation in the European countries of CEMA gradually improved, in no small measure also against the overall background of more favorable developments in world economics, even though the negative effects of many external factors persist.

A more detailed analysis of the progress made by European CEMA countries would show that their reaction to the influence of adverse external conditions was in conformity in the majority of cases. This was primarily a matter of the following decisions:

1) foreign trade must grow more rapidly than production under more difficult conditions;

2) the rate of exports must outstrip the rate of imports so as to thus gain a commercial and payments surplus which would facilitate the lowering of indebtedness in freely convertible currencies;

3) the share of intraregional trade must be strengthened;

4) the group of six smaller countries would have to lower their commercial deficit with respect to the USSR.

A graphic depiction on how this group of six smaller countries and primarily the USSR dealt with the changes in conditions which were brought about by external economic relations at the beginning of the 1980's is presented in Table 1, which captures the data on development of their trade balances for the years 1980-1984.

Table 1. Development of the Foreign Trade Balance of the European CEMA Countries for the Years 1980-1984

Foreign Trade Balance	Year	Six Smaller Countries, Total*	USSR	European CEMA Countries, Total

* Bulgaria, Czechoslovakia, Hungary, GDR, Poland, Romania.

** Preliminary estimate of the UN Economic Commission for Europe.

Source: "Economic Survey of Europe in 1984-1985," ECE, Geneva, 1985.

In comparison with the 1970's, the overall rate of foreign trade turnover for the European countries of CEMA changed considerably, although their economic policy in the foreign economic sphere attained noteworthy results. During a period in which world economics was dominated by stagnation and by a decline in international commerce, the six smaller CEMA countries constantly recorded commercial surpluses with respect to relations with nonsocialist countries, beginning in 1982.

The foreign trade turnover of the six smaller European CEMA countries rose roughly 2.8 percent between 1981 and 1984, including a rise in exports as a result of the selected strategy by about 10.3 percent and imports declined roughly by 4 percent. In constant prices, exports rose by roughly 27.5 percent, whereas imports declined by 2.5 percent. The foreign trade turnover of the Soviet Union for the same period rose by roughly 17.5 percent, including exports which rose by 20 percent and imports which rose by 15.3 percent. In constant prices, the increment in Soviet exports only accounted for not quite 14 percent and imports were virtually 26 percent.

In 1984, there thus developed a surplus in the cumulative balance of foreign trade for the European CEMA countries of a magnitude of roughly $19 billion, of which roughly $6.4 billion fell to the group of the six smaller countries. What is noteworthy is the fact that the entire increment of the surplus last year was again attained (in contrast to 1982) exclusively in trade involving developed capitalist nations. The active foreign trade balance in this category virtually doubled over 1983 to roughly $9 billion, of which approximately one-half is accounted for by the group of smaller countries. The trade surplus involving developing countries declined further during 1984 as a result of their payments difficulties. The six smaller CEMA countries attained the above surplus despite the deterioration of exchange transactions in trade involving freely convertible currencies. However, their trade deficit with respect to the USSR increased slightly again after declining for 1982 and 1983.

This important turnaround in the development of external economic relations made it possible for the six smaller European CEMA countries to lower their indebtedness in terms of freely convertible currencies, beginning in 1982. In 1984, it is estimated that their net indebtedness declined by an additional $6 billion.

Although a certain rise in commercial turnover involving capitalist nations was recorded in the last 2 years, the changing conditions in the world economy led to further shifts in territorial intentions in the foreign trade of CEMA countries; the share of intraregional trade within all of CEMA rose virtually to 60 percent.

It is certain that an orientation toward renewal of external balances by the six smaller European CEMA countries yielded positive results during the course of the current 5-year plans. However, it simultaneously confirms the fact that at the beginning of the 1980's the development of external economic factors had an extraordinarily strong influence, and in some cases a decisive influence, on the economic activities of these countries. Without regard to its essential nature, this orientation seriously influenced the course of internal economic processes and starting conditions for the second half of the 1980's. The transfer of resources to foreign countries meant lower increments in consumed national income, caused limitation of investments for development, and resulted in more modest increases in consumption.

A natural result of the situation during which the majority of the European CEMA countries were forced to constantly attain a trade surplus at the beginning of the 1980's in order to, thus, compensate for the effects of the unfavorable developments in exchange transactions and particularly in order to be able to lower the burden of foreign debt was the fact that the volume of consumed national income grew at a much slower rate than produced national income, the rate of which, furthermore, was falling behind the level of original intentions (see Table 2).

As is evident from Table 2, consumed national income for the period 1981-1983 increased only for Bulgaria and for the USSR. Of course, even in Bulgaria domestic consumption grew at a slower rate starting in 1982 than did the gross domestic product and more rapidly than consumed national income for the entire period 1981-1983 and, clearly, even last year. In the other countries for which we have data (Romania does not publish annual data on consumed national income), consumed national income for the years 1981-1983 declined on the whole.

* Not counting Romania, which does not publish this type of data.
** Gross national product in parentheses.
*** Estimate by the UN Economic Commission for Europe.

Source: "Statisticheskoy yezhegodnik stran-chlenov SEV 1984," Finansy i statistika, Moscow, 1984; "Economic Survey of Europe in 1984-1985," ECE, Geneva, 1985.

This development did not remain without influence upon the share of capital formation and consumption in consumed national income, without influencing the overall structure of domestic consumption. With the efforts of economic policy to maintain the extent of consumption in a situation during which the increments in disposable resources were lowered, the results were that the share of consumption (personal and social) in consumed national income was increased whereas the capital accumulation component was considerably lowered. In fact, we can state that accumulation became more of a residual factor which remained after the losses caused by developments of exchange transactions were compensated for and after the need to lower the foreign debt and the need to maintain or raise the achieved level of personal and social consumption were satisfied. Consequently, as Table 2 confirms, the rate of accumulation for the period 1981-1983 declined whereas the share of consumption in consumed national income rose. Only the USSR did not once record a decline in accumulation during the years under investigation and its overall rate increased. The result of this development in the investment sphere was that, with the exception of Poland, the share of investments in the national income [declined] and, in the majority of cases, this share dropped below the levels anticipated by the 5-year plan.

Positive Turnaround in the Last 2 Years

As was already stated, the rate of growth of national income for the European countries of CEMA underwent a certain positive turn during the last 2 years. The national income in the region increased by 4.1 percent in 1983 and by 3.6 percent last year which, in comparison with 1981-1982, represents an express acceleration of its growth. Formerly, it might be correct to date the above turnaround from 1982 when the cumulative increment in the national income rose by 2.8 percent in comparison with the low results of 1.7 percent during the previous year; however, one cannot ignore the fact that the accelerated growth in 1982 was based almost exclusively on developments in the USSR and was, furthermore, dictated by a specific increase in agricultural production (by 5.5 percent, compared with the decline of 1 percent during the previous year). The national income of the six smaller countries of CEMA during 1982 stagnated and, if we exclude Poland, grew by less than it did in 1981 (by somewhat more than 2 percent compared to not quite 3 percent); the rate of growth of industrial production in the USSR, however, declined again. The express acceleration in economic growth during the following year, however, was already supported by an increase in the increment in production growth, both within the group of six smaller countries, as well as in the USSR.

According to the annual plans, national income in the region this year should be experiencing a growth of about 4.2 percent. On this basis, it is possible to judge that the European countries of CEMA are currently striving to maintain the rate of economic development at the attained levels. This is also confirmed by fragmentary information regarding the prepared 5-year plans for the period 1986 through 1990.

As far as development in the individual countries is concerned, Bulgaria, which maintained its economic growth rate at a relatively high level during the entire period of the 1980's, last year recorded an increase in national income of 4.6 percent, compared to 3 percent in 1983; this year's increase is expected to be 4.1 percent according to the plan. In Czechoslovakia last year the national income rose by 3 percent, compared to 2.3 percent in 1983, and is expected to increase by 3 percent this year. Hungary, which like Czechoslovakia had planned a relatively low growth rate for the period 1981 through 1985 and last year also recorded a substantial increase in national income (2.8-3 percent as opposed to 0.3 percent), plans an increase this year of 2.3-2.8 percent. The GDR, like Bulgaria, achieved relatively high rates of growth in national income during the first half of the 1980's (last year, 5.5 percent as opposed to 4.4 percent) and this year is looking for an increase of 4.4 percent.

In view of the past socioeconomic crisis, the case of Poland is completely specific. If we ignore the deep economic decline from the 1979-1982 period, then it must be said that this country again recorded a high growth in national income last year (5.1 percent as opposed to 6 percent), with the plan for this year looking for 3 to 3.5 percent. This indicates that Poland is gradually returning to normal development, even though we cannot overlook the fact that the national income for last year was merely approaching the level achieved in 1975 and that payments conditions involving foreign countries still constitute a great problem despite the agreement involving the so-called Club of Paris.

As far as Romania is concerned, its economic growth last year also speeded up (7.7 percent as opposed to 3.7 percent) and, according to the plan, this process should continue this year (+10 percent). During the first half of the 1980's, the USSR was among the European CEMA countries which were undergoing the most stable development. Its consumed national income for last year, however, grew only by 2.6 percent as opposed to 3.6 percent during 1983, which was the result of the failure of the harvest; this year, an increase of 3.5 percent is anticipated.

Changes in the rate of industrial production over the past few years have been largely in conformance with developments affecting the rate of national income. Following small increases for the period 1981-1982 (2.2 and 2.4 percent), the rate of growth in industrial production virtually doubled during the following 2 years with a 1984 cumulative increment being 4.4 percent, which exceeded the plan and the results achieved in 1983 (4.3 percent) and was the highest since 1978. This year, it is anticipated that the cumulative increment will be 4.1 percent, which again indicates that the effort is currently aimed at maintaining a higher growth rate.

Gross industrial production in the individual European countries of CEMA last year grew as follows: Bulgaria +4.6 percent, Czechoslovakia +3.9 percent, Hungary +3 percent, GDR (market production) +4.2 percent, Poland +5.3 percent, Romania (market production) +6.7 percent, USSR +4.2 percent. With the exception of Poland, where the increment was lower, and the USSR, where it remained the same, all countries recorded a growth rate in industrial production which was higher in comparison to 1983 and, in a number of cases (Czechoslovakia, Hungary, GDR, Poland, USSR) even exceeded planned levels. Only Bulgaria (+5.2 percent) and Romania (+7.5 percent) are anticipating a growth in industrial production for this year.

The increment in gross agricultural production for the six smaller countries of CEMA last year was more than three times higher than was evident from annual plans (6.9 percent as opposed to 2.2 percent) and very specifically exceeded the levels of the previous year (0.8 percent) and those achieved in

1981-1982 (on average by about 1.7 percent). In Bulgaria, gross agricultural production rose by 6.8 percent (as opposed to -7.2 percent in 1983); in Czechoslovakia by 3.6 percent (4.2 percent); in Hungary by 2.5-2 percent (-2.7 percent); in the GDR by 8.5 percent (4.1 percent); in Poland by 5.7 percent (3.3 percent); and in Romania by 13.3 percent (-1.6 percent). In view of these high results substantially lower goals were set for this year.

Gross agricultural production in the USSR was declining in the period 1979-1981; in the following 2 years it recorded high increments (5.5 and 6.7 percent) and last year it stagnated despite the fact that the plan called for a growth of 6.4 percent. For this year, it is expected to increase by 6.7 percent. In the case of the USSR, agriculture exerts a very significant influence upon the resulting rate of economic growth (its share in the national income in 1983 was more than 20 percent). This was confirmed also last year when the stagnation in agriculture resulted in lowering the increment in the national income and, thus, halted the acceleration which had begun in 1983.

In the majority of the European countries of CEMA the main factor determining agricultural results is the harvest of grain. This harvest was outstanding and higher than that of 1983 last year in all cases except the USSR. Bulgaria harvested 9.3 million tons, Czechoslovakia 12 million tons, Hungary 15.7 million tons, the GDR 11.5 million tons, Poland 24.4 million tons, and Romania 23.6 million tons. Overall, the production of grain in the six smaller European CEMA countries thus, for the first time, approached 100 million tons, which is only a little less than the quantities called for by the 5-year plan for 1985 and it is 25 percent more than the average for the second half of the 1970's. According to estimates provided by the Food and Agricultural Organization of the United Nations, last year's grain harvest in the USSR amounted to 170 million tons, which is 30 million tons less than the year before.

As far as productivity is concerned, available direct and indirect data indicate that last year it continued to grow at a rate close to the rate shown by the national income, or even at a higher rate, as was the case in Hungary. In Bulgaria, the entire increment in national income was assured by an increase in the productivity of labor; employment in the production sphere in Czechoslovakia increased by 0.5 percent, productivity in Hungary rose by more than 3.5 percent, in the GDR it increased by 5 percent, and in the USSR the growth in productivity accounted for 94 percent of the increment in the national income.

According to a number of indications, the effectiveness of basic production assets continued to decline in the majority of cases, even though the rate of decline was obviously somewhat slower as a result of the slowdown in the growth of capital assets.

During 1980 to 1982, the economic growth of the European countries of CEMA was limited, among others, by a shortage of selected material inputs. The subsequent increase in production on the part of the responsible branches and imports contributed to the elimination of appropriate bottlenecks. However, preliminary evaluations of the development of the overall material-intensive nature of production in the European countries of CEMA on the basis of comparisons between gross social product and national income do not indicate that some kind of specific improvement had set in in this direction over the past few years. The level of the material-intensive nature of production in the majority of the European countries of CEMA, thus, remains very high in comparison with current technological standards and is roughly 40 percent higher than that recorded by developed capitalist nations.

As has already been stated, the need to create growing trade surpluses led to a decline or a slower rate of growth for consumed national income during 1981-1983 in comparison with produced national income. This, together with an economic policy which stressed consumption over accumulation, had a great influence on investments. On balance, it can be stated that the development of investments in 1981-1984 roughly followed the rate of economic growth. Low increments or actual absolute declines in 1981-1982 were replaced in the subsequent period by a certain increase in the rate of capital construction. With considerable differences between individual countries, the cumulative increase in investments for 1984 was 2.4 percent as opposed to 4.7 percent during the previous year and was not quite an average of 1 percent during 1981-1982. In Czechoslovakia and in Romania, the increment in investments for last year was higher (1.5 percent or 6.1 percent, as opposed to 0.6 percent and 2.5 percent, respectively). In Bulgaria, investments stagnated (compared to an increment of 0.7 percent in 1983); in Hungary, the long-term absolute decline continued; in the GDR, investments also stagnated, as they had done in 1983; in Poland, the very high increase in investments of 1983 (9.4 percent) declined to 8 percent; and in the USSR, the increase in investments declined to 2 percent as opposed to 5.8 percent in 1983. This year, all countries, except the GDR and Poland, anticipate an increase in the growth rate for investments.

Real income for the population, which is the most common indicator of the development of the standard of living, increased in 1981-1984 in all European countries of CEMA. In comparison with the previous 5-year period, however, increases attained were lower. However, such a development had been built into the 5-year plans covering the period 1981 through 1985. Last year, substantial increases in real income occurred in the GDR (+4 percent), USSR (+3 percent), Bulgaria (+2.7 percent), and, according to estimates, also in Romania. In the other countries, real income growth was more moderate and roughly at the level of the previous year. Targets for 1984, however, were fulfilled in all countries.

Key Task of Socialist Economic Integration

The real economic processes under way in the European countries of CEMA and the developments in international policies and the economic situation in the world are very clearly reflected in the process of socialist economic integration. The achieved level of production forces and the degree of mutual cooperation among CEMA member countries, the specific changes in internal and external economic conditions and factors influencing their development, new attempts by some of the most powerful capitalist nations to gain superiority over socialist countries and a number of unsolved questions carried over from the previous era demanded the formulation of a clear path for the further development of socialist economic integration during the current and ensuing periods. This task was fulfilled by the economic consultation of CEMA nations at the highest level [CEMA summit] which took place last June in Moscow. If the conclusions of this summit can be summarized into two fundamental tasks, then they are the strengthening of mutual unity among CEMA member countries and the close interconnection between the production-technical base and scientific-technical progress and capital construction.

Currently, the coordination of national economic plans for the years 1986-1990 is being concluded and the directives of last year's economic summit aimed at coordinating economic policy are being fulfilled within the framework of this coordination as well as through the medium of additional negotiations and actions. This multilateral coordination is connected with bilateral coordination. Bilateral programs of development with respect to economic and scientific-technical cooperation through the year 2000 have already been signed between the USSR and the majority of the other CEMA member countries and a number of similar programs have been concluded between the smaller CEMA countries. In this respect, great attention is being devoted particularly to the introduction and expansion of production of modern machines and installations and to increasing the technical level and quality of mutually delivered products. In the final phase of coordination involving the national economic plans for the period 1986-1990, additional possibilities are being sought for developing economic cooperation, primarily in the form of international specialization and coproduction, possibilities for increasing mutual turnover of goods, for the more thorough utilization of existing production capacities, and mutual pledges are being recorded which have to do with improving the technical level and quality of particularly important types of mutually delivered products.

A substantial part of the work connected with preparing the Comprehensive Program of Scientific-Technical Progress in CEMA Member Countries for the Next 15 to 20 Years, which is supposed to be approved at the 12th Session of the CEMA Council in 1986 in Bucharest, has already been completed.

It is indicative that mutual trade between CEMA member nations is recently developing more rapidly than their overall volume of foreign trade. Whereas foreign trade turnover of the CEMA countries in 1984 exceeded 313 billion transferable rubles, which was 9.7 percent more than during the previous year, mutual trade rose by 10 percent to 185 million transferable rubles and its share in the overall turnover achieved 59.2 percent, as opposed to 58.7 percent in 1983 and 53.8 percent in 1980. Deliveries of machines and installations involved in this mutual trade increased by 12 percent.

From the essence of CEMA, it is clear that member states with more developed economies render aid to less economically developed nations and provide support in developing the principal national economic sectors and take care of their deeper commitment to the international socialist division of labor. The most recent CEMA session in Warsaw indicates that permanent attention needs to be paid to deepening and perfecting cooperation between the European member nations and Vietnam, Cuba, and Mongolia.

Cooperation between CEMA member nations and Yugoslavia is developing well in 23 specific areas of activities of the council. The best results are being achieved in engineering. Trade between both sides last year rose by 12.7

percent to 9.6 billion transferable rubles, with CEMA member countries sharing approximately 43 percent in Yugoslavia's foreign trade turnover.

Recently, cooperation with a whole series of other nations has deepened. A treaty was concluded between CEMA and the Mozambique People's Republic. One of the important results of the 11th Session of the CEMA Council is the expressed intention to expand industrial cooperation with developing countries in the production of finished products with a view toward the interests and possibilities at the disposal of the involved sides. Not even the new initiative by the socialist countries pertaining to the initiation of relationships between CEMA and the European Economic Community can be overlooked.

Real development clearly indicates that the transition of the European countires of CEMA to the path of intensive economic development under difficult and frequently very unfavorable external economic conditions, which are, furthermore, accompanied by the tense international situation as a result of the confrontational course adopted primarily by some political circles in the United States, is, to a considerable extent, dependent on the successful development of the process of socialist economic integration and on the further strengthening of the unity and mutual closeness between the CEMA nations. It is, therefore, only possible to welcome the increased efforts on the part of the socialist states and organs of CEMA which are aimed in this direction and which are quite clearly reflected in the entire period since the CEMA economic summit which took place in June of last year in Moscow.

EAST-WEST TRADE DEALS

Warsaw POLITYKA in Polish No 2, 11 Jan 86 p 14, supplement POLITYKA EKSPORT IMPORT No 1, Jan 86

[Article: "East-West"]

[Text] HUNGARY-NIGERIA: On the basis of an agreement reached by representatives of the Hungarian commerce headquarters, Komplex, Hungarian enterprises will participate in building grain mills in Nigeria; construction will begin shortly. Elgep, the Hungarian machine company, will be the principal contractor and local Nigerian enterprises will cooperate in the project. The elevator and mills with a capacity of 300 tons daily are scheduled for completion by the end of 1986; after reaching full production capacity, they will operate on a "joint venture" basis with 20 percent Hungarian participation.

HUNGARY-WEST GERMANY: The Hungarian, Hungarcoop, signed a cooperative agreement with the West German firm, Salamander, for the production of 700,000 pairs of high quality men's boots during the second half of 1985. Salamander will provide some of the production equipment.

ITALY-USSR: Snamprogetti, an affiliate of the Italian concern, ENI, will construct a pipeline system for the transport of coal from mines in Belev to Novosibirsk. The system developed by the Italian firm is one of the most advanced systems for transport of coal through a pipeline. The Italians will sell a license for the technology and supply the basic equipment. The value of the contract is approximately 100 billion lira.

HUNGARY-EGYPT: A cooperative agreement was signed in Budapest that provides for the Hungarian Ganz Mawag plants and the Egyptian Tersana Steel Structures firms to begin manufacturing small and medium sized irrigation pumps jointly beginning next year. Some of the components will be produced in Hungary and then assembled in Egypt. Parts manufactured in Egypt according to Hungarian designs will make it possible to assemble complete units. This cooperative agreement was preceded by many years during which Hungarian irrigation equipment was sold and earned a good reputation in the Egyptian market. In 1985 alone, Egyptians ordered 17 intermediate pumping stations worth $6 million from Hungary.

NORWAY-SOCIALIST COUNTRIES: Konsberg Vaspenfabrikk, Norwegian producer of electronic equipment, established a trade firm, Konsbergtrade, especially for conducting barter transactions with the USSR and other socialist countries. Konsbergtrade plans to open an office in Moscow. During the last several years, Konsberg was selling the USSR equipment valued at 100 million kroner annually. The Norwegian firm also intends to represent other Norwegian producers interested in selling their products to socialist countries.

YUGOSLAVIA-NORWAY: The Uljanik shipyard in Pula, Yugoslavia, launched a ship 210.5 meters long and 48 meters wide, ordered by Norway. The ship is equipped with a 10,840 kW motor, the first of this size produced by this shipyard. This year the Uljanik shipyard built six large marine units intended for export; income from this activity was $170 million.

U.S.A.-HUNGARY: The well-known American magazine, SCIENTIFIC AMERICAN, will be published in Hungarian. The magazine will be licensed to be printed in Hungary and every issue will contain an additional insert edited by Hungarian scholars.

USSR-BURKINA FASO: Technointorg will supply Burkina Faso with 30 film projectors to be installed in movie theaters. A group of projectionists from Burkina Faso visited Leningrad where they became acquainted with using and servicing the Soviet equipment.

EAST GERMANY-FINLAND: Two long-term agreements were signed in Berlin by representatives of the Finnish firm, Kemira, and the German firm, Kali-Berghan. The agreement covered the sale of potassium fertilizers to Finland and processing of potassium salts obtained from East Germany into potassium sulfates in Finland.

JAPAN-HUNGARY: One of the departments of the Japanese firm, Mitsubishi, will supply the Hungarian paper mill in Nyiregyhaza with equipment for processing paper. This contract was concluded within the framework of the line of credit accorded Hungary by the World Bank amounting to $7.5 million.

GREAT BRITAIN-YUGOSLAVIA: ICL, The British computer company, will supply the Robna Kuce network of shops in Belgrade computerized cash registers which will make it possible to keep track of merchandise sold. The equipment is valued at more than £1 million.

BRAZIL-CUBA: At a cost of $3 million, Cuba bought equipment for alcohol distilling plants from the Brazilian firm, Codistil. This equipment has a production capacity of 60,000 liters of pure alcohol daily. It will be used to produce rum, a basic Cuban export.

BELGIUM-USSR: The Belgian steel company, Sidmar, is increasing export of steel to the USSR. Within the framework of a long-term contract, it was agreed that export of sheet steel would be increased from 240,000 to 500,000 tons annually in 1990. The Soviet automotive industry will be the principal recipient of the sheet steel.

CEMA CURRENCIES CONVERTIBILITY NOT LIKELY

Warsaw GOSPODARKA PLANOWA in Polish No 7-8, Jul-Aug 85 pp 418-420

[Article by Marian Guzek: "Possibility of Introducing Currency Convertibility in CEMA Countries"]

[Text] The first question that requires explanation is whether the lack of currency convertibility in CEMA countries thus far is more the result of its being rejected as a negative phenomenon by economic policy or whether this lack is caused by a fear of the consequences, potentially difficult to overcome, that would accompany the introduction of currency convertibility under conditions that did not favor it.

It seems that despite a certain resistance in some countries, the numbers of decided opponents of convertibility is not large either among theoreticians or among practitioners. Moreover, this resistance pertains not to convertibility in itself, but to the market mechanism connected with convertibility. We may assume that absence of convertibility is due mainly to the fact that conditions for its introduction are not ripe and to the anticipated impossibility of effectively overcoming the difficulties it would engender.

This statement may evoke doubts in light of the fact that some underdeveloped countries introduced convertibility of their currency despite conditions poorer than those in socialist countries. This is true, but there is a difference between underdeveloped countries and socialist countries in that the former agree to make their production structure dependent on current signals from the world market even if this means petrification of a single-crop economy, while the socialist countries aspire, regardless of type of economy in place, to formulate the economic structures in a way different from the directions indicated by current signals of the world market, even if these aspirations are not accompanied by modernizing the structure of export in the sense of actually increasing the export proportion of industrial manufactured goods.

These points lead to the conclusion that the possibilities of introducing convertibility in socialist countries depend on whether these countries will give up the aspirations mentioned while the internal economy develops, reconciling themselves to the effects of convertibility, even such effects as are evident in underdeveloped countries, or whether they will be able to bring to a sufficient maturity conditions that would ensure positive results of convertibility, as has happened in highly developed countries.

To accept the idea that absence of convertibility is not the result of voluntarism, but an objectively based solution under economic conditions that have existed thus far (among which we might also include the government's developmental preferences), the question as to how these conditions would have to be changed in order for convertibility to be introduced becomes important

From the historical experience of the highly developed countries, it is evident that successful results of convertibility depend on a pro-export structure of branches of industry created before convertibility is introduced. This statement may seem controversial, particularly in connection with the conviction, universal in Poland, that it is specifically currency convertibility that can ensure structural transformation of production and the formation of highly specialized areas of manufacturing. This is actually a proper conviction, but only with respect to the assortment structure of production within the framework of specific branches of industry. Pro-export branches do not appear, however, as a result of introducing convertibility, but as a result of a long-term development policy of the country together with protective measures. To the extent that typical protective measures (duties, compensatory taxes, subsidies, taxes, etc.) have a selective effect, a particular protective measure has a universal effect, that is, it touches the whole economy and not selected branches; lack of currency convertibility can be recognized as one such measure. Fitting the type of protective measure and the force of effect of a protective measure to long-term structural preferences of the country is a matter of no small importance.

If only a very few branches are going to be strongly protected, when the country already has a firmly established and desired economic network structure, then there is no merit in resorting to maintaining nonconvertible currency since normal, selective protective means will suffice. But if the structure of the whole economy is flawed and the country wants to bring about its transformation, then it can use nonconvertible currency. Examples of this procedure can be found in the history of highly developed capitalist countries. Japan can serve as the most recent example; it introduced convertibility not at the beginning, nor even in the middle of the industrialization process, but only after the formation of a secure pro-export structure of its industrial branches.

Nevertheless, using nonconvertible currency is not enough to attain such effects, as is apparent in our country and in other countries, and that includes nonsocialist countries. I will discuss the reasons for this shortly, but now we must answer the question as to whether the branch structure created in socialist countries thus far is rational enough to not require particular protection in the form of nonconvertible currency or whether it continues to need such protection.

It seems that with respect to most countries, we may admit at the outset that the first of these possibilities fits, with the exception of poorly developed socialist countries. In a country such as Poland, it is difficult to admit that we have a pro-export network structure in spite of the fact that an adequate number of industrial branches are represented in the economy, and what we are concerned with is only proportional changes among them, which is an easier task than creating new branches of industry from the bottom up. More precisely we should say that this task would be easier if besides the typical selective protective means that correct the flow of commerce, effective additional economic mechanisms resulting from the introduction of convertibility might be applied, specifically a mechanism of rational allocation of investment that would make the level of pro-export reorganizations of the branch structure directly dependent. This pertains to systemic questions which will be discussed below.

The most important questions connected with the transformation of systemic conditions, inevitable from the point of view of convertibility, are the following:

--does the order-distributive model allow introduction of convertibility?

--will a transition to a decentralized system ensure attaining the expected results of convertibility?

Although convertibility has not been introduced in any socialist country whose economy operates according to principles of a centralist model, on theoretical grounds such a measure might be possible in this model if quantitative limits of import and qualitative export tasks were given up and were replaced by limits and tasks established according to value in the aggregate sense. (An indispensable condition would also be the creation of substantial reserves of hard currency. This condition is linked to the state of the balance of payments and might create serious difficulties during less favorable periods. We will bypass this matter as being secondary as against structural and systemic reorganizations.) The efficacy of convertibility would depend then on the reaction of the foreign trade apparatus and the production apparatus to the changing foreign demand resulting from the partners' accumulating Polish currency and from the behavior of Polish producers and importers who could acquire hard currency for imports.

If these reactions would not lead to the formation of specialized export centers in manufacturing to compete on the world market within a framework of branch structures regulated directly by the central authorities, we would have to deal with the fact that the money generated by foreign demand would flow in the direction of raw materials and agricultural products, which would consolidate the traditional export structure and would make it more difficult to realize the structural intents of the central authorities. Thus, getting beneficial effects from convertibility depends on a properly performing mechanism of allocating funds within the branches, including hard currency funds bought by the enterprises. This problem is connected with readiness to undertake the risk of switching the production apparatus to the needs of export. Therefore, if we were not to create additional conditions to ensure attainment of the desired effects from convertibility, its introduction alone, though theoretically possible, would not serve its purpose.

In the extreme case, after introducing convertivility, the internal market might become stripped of goods subsidized by the state (mainly food products). In order to avoid this, it would be necessary to introduce rigorous export barriers. This would only mean a drop of foreign demand for Polish currency, which would have to be devalued, reinforcing inflation processes. Scarcity of hard currency would make the central authorities resort to reestablishing controls. Thus, there would be a retreat from convertibility, or, in the opposite event, an increase in inflation. Both possibilities at least point to the negligible likelihood of introducing convertible currency (even to a limited extent) in countries that have centralized administrative systems.

Now we must consider the question formulated previously: is it possible to attain the desired effects of convertibility in an economy reformed according to market principles? At the outset we must say that in such a system, the introduction of convertibility in itself is significantly easier and more likely. On the one hand, convertible currency is a logical element of the market mechanism, and on the other, reforms of this type are accompanied by the widespread conviction that, in comparison with the order-distributive model, they ensure such far-reaching transformations of conditions of management that it is realistic to expect complete efficiency of the market system, including the currency market, similar to that in the highly developed capitalist countries.

Unfortunately, this is excessive optimism. Even on theoretical grounds we can state that in a socialist economy, the market mechanism cannot operate as efficiently as in a capitalist economy since adopting the market mechanism does not mean carrying over with it the mechanism of allocation of funds that operates in a capitalist economy. This mechanism is based on private profit, which constitutes the motivation for undertaking a great risk, and stimuli such as dividends are an incentive for saving for the purpose of making investments according to the principles of maximizing profit. The experience of socialist countries with decentralized systems, specifically Yugoslavia, indicates that personnel of enterprises are interested in spending most of current pay on consumer goods, and development funds are not sufficiently fed; this results in investments having to be financed by central authorities from inflation or from external sources (that is, foreign credits). However, even saved or newly created funds are not invested in a manner that would ensure a pro-export industrial structure. This makes it difficult to take advantage of the attributes of convertibility (just as it does, after all, of unemployment, which was introduced in Yugoslavia, but had no real influence on efficiency or productivity of labor).

Real progress in introducing convertibility might be achieved after deeper reforms than have been realized thus far, reforms that would eliminate both the lack of a mechanism of rational allocation of funds and the lack of a system of motivation, especially in investment activity. This, however, does not seem possible in the current decade.

In conclusion, we may therefore say that because of the difficulty in changing the conditions that are decisive in the positive effects of convertibility, there is very little likelihood that currency convertibility will be introduced in CEMA countries. This does not mean, however, that introducing convertibility has ceased to be a task worthy of postulation. The degree of reality of this postulate also depends, after all, on the objective and geographic scope of convertibility. Convertibility limited to certain CEMA countries, and limited to only some of their foreign operations and some of materials authorized for obtaining foreign currency, is more likely. Less likely is complete convertibility not only with respect to currency of capitalist countries, but also with respect to currency of CEMA countries.

The realization of limited currency convertibility would facilitate achieving a pro-export orientation in industrial manufacturing, accumulation of more substantial hard currency reserves, introducing a competent currency course coupled with a system of so-called protective norms as means of realizing the preferred economic structure, and creating incentives for the external partners to invest deposits in Poland.

ISSUES IN CPSU CONGRESS RUN-UP EXPLAINED

AU301337 Warsaw TRYBUNA LUDU in Polish 27 Jan 86 p 6

[Article by Fyodor Breus, NOVOSTI: "A Look Into the Future"]

[Excerpt] "Competition is being displaced by automatization"--this was the conclusion a certain Western observer arrived at after familiarizing himself with the draft documents which are currently being discussed by the Soviet public and will be discussed at the 27th CPSU Congress which will open in Moscow on 26 February 1986.

Still, I think this startling conclusion is clearly unequivocal if it represents an assessment of the new phase of competition between socialism and capitalism. The USSR does not close its eyes to the results produced in Japan and the United States through the exploitation of scientific and technological achievements and in the advanced industrial countries of Western Europe chasing after them. We are considering their achievements and our own enormous economic and scientific and technological potential in assessing possibilities for the next 5 years and the period leading up to the beginning of the next century.

This view of the future has been given a theoretical and concrete foundation in the form of the new version of the party program and the draft document on the fundamental directions of Soviet economic development until the year 2000.

The fundamental directions of activity are as follows: The country's economic potential is to be doubled over the next 15 years; it is envisaged that industrial output will at least double; the process of introducing industrial methods of operation into agriculture will be completed, and this will result in agriculture being less affected by infavorable climatic conditions.

The raising of productivity levels to the highest world levels has been made a task. Productivity will have to rise between 2.3 and 2.5 times. The rise in productivity alone will ensure that national income and material production increases. Shifting the economy from an extensive to an intensive pattern will make it possible to satisfy the 75-80 percent increase in the demand for fuels, energy, and raw materials by reducing their consumption in every sector.

During the 1970's many theoretical discussions and practical searches were conducted with the aim of bringing workers into the control and management of production. Sociologists assured us that the scientific and technological revolution, and our "entry into the technotronic age" would not hinder the development of "industrial democracy" but on the contrary would "open up unprecedented opportunities."

It has become apparent since then that the discussion on "democracy in the workplace" that were conducted during the last decade have not gone beyond the narrow confines of auditoria, neither in the United States or the FRG, nor in Great Britain, France, and Italy.

In recent years, the Soviet Union and other socialist countries have been working on ways of accelerating the scientific and technological revolution and in doing so they have conducted experiments aimed at improving the management of the economy and the fuller realization of the advantages of socialism in production democracy. Participants in these experiments have displayed increased interest in the use of such levers as profits, cost effectiveness analyses, pricing, and the creation of enterprise development funds--that is funds for the technical modernization of production--and funds for material and other incentive systems.

All these initiatives provoked an immediate response in the West. "Sovietologists" called these initiatives moves toward "market socialism" and they regarded the development of collectivity in management as "stifling the rights of the individual."

We know that we are not living in an ideal society yet. We know that someone who occupies an active place in life often finds that struggling with bureaucrats and defrauders, or economic activists engaged in crooked practices, costs a lot of nerves. Communists provide an example in the struggle to ensure the triumph of the socialist way of life whose features predominate in society.

In the context of our discussion of the role that the Soviet citizen can play in the running of society and the economy and his opportunities to develop self-management bodies from below, we have a right to declare that in the human rights sphere, beginning with employment, we are well ahead of the West.

This does not mean that everything is perfectly all right and that we are pleased with everything. Let us at least consider the Leninist conception of self-government of which the new draft CPSU program reminds us. It has nothing in common with the anarchosyndicalist version of self-government which is incompatible with socialist statehood and is based on group ownership and deals exclusively with group interests. True self-government, stresses the CPSU, is based on social ownership and unites in itself state, collective, and personal interests.

CPCZ'S HOFFMANN ATTENDS HUNGARIAN TRADE UNION CONGRESS

Heads Czech Trade Union Group

LD141421 Prague Domestic Service in Czech 1000 GMT 14 Feb 86

[Excerpts] The 25th congress of Hungarian trade unions began in Budapest today.

Taking part in the congress will be the delegation of the Czechoslovak Central Council of Trade Unions led by Karel Hoffmann, member of the CPCZ Central Committee Presidium and chairman of the Central Council of Trade Unions.

Conveys Greetings to Gaspar

LD141611 Prague Domestic Service in Czech GMT 14 Feb 86

[Text] Hungary: Karel Hoffmann, member of the CPCZ Central Committee presidium and chairman of the Central Council of Trade Unions, presented a letter of greetings from the Central Council of Trade Unions to the 25th Congress of Hungarian Trade Unions to Sandor Gaspar, member of the MSZMP Central Committee Politburo and chairman of the Hungarian National Trade Union Council. On behalf of Czechoslovak trade unionists the letter conveys cordial greetings to the congress and expresses conviction that the present session will result in another step forward in the building of a developed socialist society in Hungary. The document says that both trade union organizations concentrate their efforts to help in fulfilling the demanding tasks of the economic integration of CEMA countries and to secure the high standard of living of the workers which has been achieved. This is effectively aided by the very good cooperation which we are determined to continue to develop and to deepen cooperation between Czechoslovak and Hungarian trade uions in international activity is also developing successfully. The document emphasizes that we will continue to support efforts to achieve action unity of the European and World Trade union movement aimed at a successful struggle for the life interests and security of workers, for social progress, for socialism.

AUSTRIA-CSSR RELATIONS CALLED 'BEST SINCE WW I'

AU121441 Vienna WIENER ZEITUNG in German 12 Feb 86 p 3

[Text] Between the CSSR and Austria there are at present the "best developed relations" since the establishment of the two republics after World War I -- this was stated on Monday [10 February] by Marak Venuta, CSSR ambassador in Austria, at the opening of a Czechoslovak Week of Culture at the Vienna-Brigittenau adult evening school.

The Bratislava meeting between President Rudolf Kirchschlaeger and CSSR President Gustav Husak on 31 January has again shown the wish of both sides to live as good neighbors, he said, adding that the conclusion of a Czechoslovak-Austrian environmental protection agreement is imminent. Further negotiations on the development of the joint Danube sector would be in the interest of both countries, he said.

According to Venuta, Austria is playing an important part in CSSR foreign trade; with a share of 16 percent of the CSSR entire trade with the West. It is the CSSR's second-biggest Western trade partner. In 1985, imports from Austria went up more than 19 percent, while exports to Austria increased by 6 percent. Thus Austria's deficit in trade with the CSSR declined. Over 90 percent of CSSR imports from Austria consist of finished goods (main partners are the VOEST Apline and the Chemie Linz company), while only one quarter of CSSR goods exported to Austria are finished goods, Venuta declared. He added that economic joint ventures could be expanded, and that cooperation in third markets could be further intensified. In Prague, construction work for the biggest hotel project in the CSSR capital will start shortly with an Austrian construction company being in charge of the project.

Last year as many as between 15 and 17 million tourists visited the CSSR, including 130,000 persons from Austria, while 130,000 CSSR citizens visited Austria, Venuta said. In 1985, about 164,000 visas were issued to Austrian citizens, about as many as in 1984. In general, the issuance of a CSSR visa now takes only 30-50 minutes; 20,000 visas were issued free of charge, mostly for official duty trips, he said.

The cultural and sports exchange between the CSSR and Austria is increasingly flourishing, Ambassador Venuta stressed. In November, "Days of Culture" are to be held in Austria with opera performances, exhibits and so forth, corresponding to the successful Austrian "Days of Culture" that were held in the CSSR in 1983. An agreement between Prague's Charles University and the Vienna University will be concluded in the near future. Youth exchange programs between the two countries are also to be expanded, Venuta declared.

RUDE PRAVO NOTES DISSATISFACTION WITH ROBOT PRODUCTION

AU071300

[Editorial Report] Prague RUDE PRAVO in Czech on 6 February on page 4 carries a 1,000-word Vaclav Marek article entitled "What About Robots?" The author says, among other things, that the state goal-oriented program for the development and application of robotics in the past 5-year plan envisaged that in 1985 a total of 3,108 robots would be in operation, of which 1,505 automated technological worksites were to be set up. However, "reality exceeds the origional intention." In 1985, there were 4,174 robots and handling devices [manipulatory] and 1,564 technological worksites "realized," with the help of which 2,871 production workers could be "saved," working conditions in many places improved, and backbreaking and monotonous work eliminated.

Thus, as regards numbers, satisfaction previails. "But, to tell the truth," Mrek continues, "three are also a quite a few things we did not succeed in mastering, things with which we still cannot be satisfied. Thus far, for example, robots in enterprises are mostly deployed individually, in partial operations. That cannot be as effective as the robotization of whole sections or whole operations. Group deployment, which is rapidly spreading throughout the world, is still an exception in our country."

This has been caused by the "poor work" on part of project-coordinating quarters, whose duty is to offer the "user" an automated complex. Thus far, however, deliveries of "bare" [hole] robots predominate, for which the user has a lot of trouble getting peripheral equipment. To date, says Marek, "robotization predominates in enginerring, while in other branches is asserts itself only slowly." He adds that there is "a fair amount of indiscipline in the development and production of robots," because in the aforementioned, figures special-purpose robots predominate, which organizations manufactured for their own particular needs. The plan for mass production of robots has not been fulfilled.

Prices of robots -- which are "far too high" -- are also under constant discussion. "Although the government adopted some measures to stimulate robotization, in essence these measures have not acquitted themselves well," because the production base has not changed. There are many manufacturers, but the majority of them produces only piecemeal, despite the fact that the series of robots manufactured elsewhere in the world grow constantly bigger. "Also parts and components, particularly electronic components, from which robots are assembled, are expensive," Marek says.

"The goal-oriented program counted on the construction of specialized enterprises for robot-manufacture. However, out of five projects only one was realized. Thus far, robots are being manufactured in provisional premises originally destined for something else, without technological equipment, with a great labor input. That, understandably, also influences prices."

SUGAR PRODUCTION FALLS 14.1 PERCENT SHORT OF PLAN

AU101210 Bratislava PRAVDA in Slovak 7 Feb 86 p 2

[Jane Janku article: "Teamwork Distinguishes a Good Collective: The Difficult Sugar Campaign Accentuated Organizational (In) Competence"]

[Excerpts] Sugar production is a continuous process. If its rhythm is upset by raw material of poor quality or by incorrect managerial or organizational measures, it is difficult, just like in music, to find the right beat again. This image used by Engineer Stefan Minarik, director of production of the Sugar and Sweets Industry concern in Bratislava, explain why, despite virtually identical conditions, individual Slovak sugar refineries achieved disparate results during the past sugar campaign.

The campaign, which lasted more than 100 days, demonstrated once again that it is advisable to speak of the harvest only after it has all been brought in. Let us recall how much optimism was generated by the sight of the sugar beet fields at the beginning of September. Experts predicted that the planned procurement of 2,095,600 metric tons of sugar beets would be not only fulfilled, but overfulfilling. The subsequent 75 days without rain and the severe frost in mid-November caused that the reality began to diverge from the forecasts. The beets not only stopped to grow and gain in weight in the dry soil but, which was even more consequential, they broke when plowed up, which greatly increased harvest losses. The final procurement balance sheet was 1,858,879 metric tons of sugar beets, more than 10 percent short of the plan.

Yet it is not only the quantity of sugar beets that determines the quantity of the produced sugar. Equally important is the beets' sugar content. The beets' sugar content for the economic production unit as a whole averaged 15.6 percent (in the Phhronsky Ruskov refinery it was as much as 16.5 percent), which was among the highest results in history. It was, for example, 1.52 percent higher than last year. However, shortcomings in treating and handling the sugar beet stocks -- particularly in the sugar refineries in Trnava, Sladkovicovo, Surany, Dunajska Streda, and Trebisov -- brought about a deterioration of the stocks' condition and a disproportionate difference between the sugar content at the time of procurement and at the time of processing. This had a market impact on the final production of sugar. Actual production fall 14.1 percent short of the planned sugar production of 232,000 metric tons, with only two sugar refineries -- those in Trencianska Tepla and Nitra -- successfully coping with tuier tasks. This represents substantial deterioration compared with preceding sugar campaigns.

BRIEFS

ALGERIAN MINISTER RECEIVED--Lubomir Strougal, premier of the federal government, received in Prague today Selim Saadi, minister of heavy industry of the Democratic and Popular Republic of Algeria. During the talks Strougal praised the foreign policy of Algeria and its active participation in solving international questions and problems. Lubomir Strougal also empahsized that relations between both countries are based on traditional friendship and cooperation which has found expression in political, economic, and cultural areas. Both representatives emphasized that if is necessary to make more effective use of these favorable conditions for growth in the exchange of goods, wider production cooperation, and development of cooperation in science and technology. CONSTRUCTION OF TV TRANSMITTERS--The 15th and 16th transmitters for the second television program are being built in Slovakia by employees of the Telecommunications Administration. The two transmitters, located at Banska Stivanica-Sitno and at Snina, will be put into operation in 1987 and 1988 respectively. The erection of three more basic transmitters will then complete the building of the network of installations for the exception of the second television program. Improving reception in smaller localities will necessitate the construction of so-called booster stations [televizni preyadec]. The number of such stations will increase by 30 in the Slovak Socialist Republic this year, of which 22 will be for the second television program. The remaining eight booster stations will improve the network for the first program. HOFFMANN, KAPEK ATTEND TALKS--The secretariats of the Central Council of Trade Unions and the Prague City Committee of the CPCZ had a joint session in Prague today. The deliberations were chaired by CPCZ Central Committee Presidium members Karel Hoffmann, chairman of the Central Council of Trade Unions and Antonin Kapek, chief secretary of the Prague City Party Committee. In the introduction, they talked about improving the living, health and social conditions of the working people of Prague, as well as of retired workers and children. They noted that a number of tasks have been secured and that the coming period places increased requirements on the development of the material technological basis of health care, improving working environment and efficient use of the objects of enterprise trade union recreation. The discussion focussed attention on coordination in developing the appeal of the Prague City party organization and of the Prague enterprises on the occasion of the 17th Congress of the party by linking science with production, modernization, creative effort of collectives for fulfilling the tasks of the Eighth 5-Year Plan, and the initiative of the Central Council of Trade Unions for lowering material expenditure by 0.5 percent, increasing labor productivity by 1 percent and quality of production in comparison with the tasks set by the state plan. SLOVAK SR AGRICULTURAL COMMISSION MEETS--The Central Commission for Repairs, Supply of Machinery and Spare Parts of the Slovak SR Ministry of Agriculture and Food was in session in Nitra today. Those present discussed the problems of supplier-customer relations between machinery and tractor stations and agricultural enterprises, and especially the care of agricultural machinery and its preparation for the first stage of spring work. The commission noted that over 20 percent of necessary mahcinery is still to be repaired in Slovakia. The supply of spare parts, however, is better than in previous years; this creates conditions for the successful completion of repair of agricultural machinery for spring work by the end of February. VIETNAMESE MINISTER ARRIVES--Prague Feb 13 (CTK)--Vietnamese Foreign Trade Minister Le Khac arrived here today on an official visit. Later in the day talks began between the Vietnamese minister and his Czechoslovak colleague Bohumil Urban on ways of intensifying economic cooperation and trade between Vietnam and Czechoslovakia. [Text] [Prague CTK in English 1636 GMT 13 Feb 86] /12640

SOVIET ENVOY PRESENTS AWARDS--Viktor Lomakin, the Soviet ambassador to Czechoslovakia, today in Prague presented honorary Soviet awards, shock worker of the Eleventh 5-Year Plan [Udernik Jedenacte Petrocnice], to 66 of the best workers, technicians and research workers from all areas of the national economy of the Czech Socialist Republic. He also praised their constructive efforts in the successful fulfillment of export orders for the Soviet Union last year and in the development of international competition. Viktor Lomakin pointed out that Soviet and Czechoslovak workers will welcome the forthcoming conferences of communists in both countries with better results. He emphaszied that all of their efforts are aimed at speeding up the intensification of the national economy, to increasing the quality of production on the basis of rapidly implementing the achievements in science and technology. Vaclav Bezel, deputy chairman of the Central Council of Trade Unions, chairman of the Czech Council of Trade Unions, pointed out the growing importance of international competition in deepening Soviet-Czechoslovak economic cooperation. Present at the ceremony were Jindrich Polednik, secretary of the CPCZ Central Committee, and other representatives from political and public life. POLISH TRANSPORT PROTOCOL--A transport protocol for 1986 between Czechoslovakia and Poland was signed yesterday in Gdynia. It sets out conditions for the volume of Czechoslovak transit through sea ports in Poland and Polish transit across Czechoslovak territory. It is expected that transit of Czechoslovak goods through Polish ports will reach a figure of 2.6 million metric tons, which is 550,000 metric tons more than last year. [Text] [Prague Domestic Service in Czech and Slovak 0100 0100 GMT 14 Feb 86 LD] /12640

LENART, SALGOVIC VISIT ENTERPRISES--Jozef Lenart, Presidium member of the CPCZ Central Committee, first secretary of the CPSL Central Committee. and Villiam Salgovic, Presidium member of the CPSL Central Committee, chairman of the Slovak National Council, paid a working visit to the Central Slovak region today. They visited the Slovak National Uprising Enterprise at Ziar Nad Hronom, where they were briefed on the most important tasks in the investment construction of this metallurgical combine--modernizing the production of aluminum. They further viewed the enterprise of secondary metallurgical production and visited a foundry for the production of automobile industry parts. [Text] [Prague Domestic Service in Czech 1530 GMT 14 Feb 86 LD] /12640

CSSR-SRV TREATY ANNIVERSARY--A festive meeting was held in the port of Haiphong today to mark the sixth anniversary of the signing of the Treaty of Friendship and Cooperation between Czechoslovakia and Vietnam. It was attended by Doan Duy Thanh, member of the Central Committee of the Communist Party of Vietnam and chief secretary of the Haiphong City Party Committee; Bohuslav Handl, the Czechoslovak ambassador, and other figures. With the assistance of the Czechoslovak trade union movement and to mark the sixth anniversary of the signing of the treaty, construction has begun of the Cultural House of Vietnamese-Czechoslovak Friendship. [Text] [Prague Domestic Service in Czech and Slovak 1800 GMT 14 Feb 86 LD] /12640

CSSR, VIETNAM SIGN TRADE AGREEMENT--Prague: A long term agreement for 1986-90 between Czechoslovakia and the Socialist Republic of Vietnam was signed today in Prague. A protocol on the exchange of goods and payments between the two countries for 1986 was signed at the same time. Czechoslovakia will export to Vietnam mainly traditional engineering products such as locomotives, telecommunications equipment, machine tools, trucks, and other products. We will import raw materials, food, and consumer goods from Vietnam. [Text] [Prague International Service in Czech and Slovak 2230 GMT 14 Feb 86] /12640

ALGERIA, CSSR TO INCREASE COOPERATION--Prague, 15/02/86 (APS)--Works of the eighth session of the Algero-Czechoslovak committee were sanctioned on Friday in Prague by the signing of a cooperation proceedings between the two countries. [sentence as received] In this regard, a certain number of decisions were defined, aiming at the reinforcement of the industrial cooperation through the joint achievement of projects examined by the operators of the two countries. On the commercial plan, negotiations are to be carried on to define a many-year programme of exchanges. [Text] [Algiers APS in English 1337 GMT 15 Feb 86] /12640

CZECHOSLOVAK-MONGOLIAN AGREEMENT SIGNED--Ulaanbaatar Feb 19 (CTK)--Foreign Trade Ministers Bohumil Urban of Czechoslovakia and Jamsrangiyn Dulmaa of Mongolia signed here today an agreement on exchange of goods and payments for the 1986-1990 period providing for about a one-third increase in their trade turnover over the previous 5-year period. Czechoslovakia's exports to Mongolia will include mainly diesel sets, equipment for the leather, footwear and clothing industries, equipment for cement plants, medical equipment, and also buses, chemicals, medicines and consumer goods. Mongolia will supply Czechoslovakia with cooper, tin and tungsten concentrates, fluorite, wool, leather, furs and other kinds of goods. Bohumil Urban was received today bv Mongolian Premier Dumaagiyn Sodnom. [Text] [Prague CTK in English 1634 GMT 19 Feb 86] /12640

WORKERS LEAVE FOR KAZAKH OILFIELDS--Budapest, 18 Jan (TANJUG) [dateline as received]--The first group of Hungarian workers recently left for Kazakhstan, where they will work in oil fields under an agreement signed between Hungary and the Soviet Union. From 4,000-5,000 Hungarian workers will be working in oil fields in Kazakhstan in the coming years, in return for which the Soviet side will deliver natural gas to Hungary via a new gas pipeline. In addition to the current 4 billion cubic meters of natural gas, Hungary will as of 1990 be receiving from the Soviet Union an additional 2 to 2.5 billion cubic meters, which will cover around 70 percent of the domestic demand in natural gas. Hungary will also participate in the further construction of the gas pipeline with deliveries of equipment and spare parts, which will bring its total investments close to one billion rubles. BANKER URGES SPECIAL ZLOTY FUND FOR FOREIGN DEBT SERVICE

Warsaw ZYCIE GOSPODARCZE in Polish No 51/52, 22-29 Dec 85 p 14

[Article by Marian Minkiewicz, chairman of the board, Bank Handlowy]

[Text] Bank Handlowy has been servicing the country's foreign debt for many years. Repayment of the debt principle and accrued interest is made in hard currency which Bank Handlowy purchases in zloty from Polish exporters. Servicing the foreign debt, therefore, involves problems in obtaining both hard currency and zloty. The heart of the problem lies naturally with hard currency, however, in recent years problems with zloty are also becoming a matter of significant concern.

Until recently, the principles employed by the country in repaying the foreign debt coupled with a stable and fixed rate of exchange had practically resolved the problem of servicing the foreign debt in zloty. In keeping with these principles, the final purchaser of goods imported on credit to Poland made payment in zloty at time of delivery. Bank Handlowy, hence, received payment in zloty equivalent to the value of foreign bank credits utilized for the import of commodities and calculated at the current exchange rate. These payments were then placed in a special interest-bearing account in the National Polish Bank. If commercial foreign credits were needed to be utilized, their conversion into zloty was made against investment accounts held by foreign trade firms in Bank Handlowy. Therefore, during a period of stable exchange rates, full settlement of foreign obligations in zloty from bank and commercial credit accounts was essentially secured.

Zloty accumulated in investment accounts were used to purchase hard currency from Polish exporters which were needed to pay credit installments. Interest accumulated from investments was used to purchase hard currency to repay interest due on loans from foreign creditors. Only when the average interest charged on foreign credits exceeded the national interest rate applied to investment was there a need to cover the difference with funds from the national budget. The amount in question, however, represented a relatively insignificant sum. Furthermore, payments from the budget were subject to the country's foreign credits which came under the secondary form of payment and thus played a minimal role.

The described system of repayment, naturally simplified and in outline form, assured the full zloty amount in servicing the foreign debt. A significant turn of events occurred with the initiation of economic reforms. The exchange rate, one of many instruments used in measuring the growth rate of individual economic units, could not remain fixed. Between the years 1982-85, in view of an inflationary rise in the cost of producing export goods and price and exchange rate fluctuations on international markets, the price of foreign currency rose significantly. This led to a shortage of zloty accumulated in investment accounts to cover foreign obligations.

Zloty in investment accounts would have indeed been sufficient to cover interest charges and in repaying the debt principle for several years without having to reach for auxiliary sources. However, after exhausting the income from investment accounts, these auxiliary sources of financing would be severely burdened in meeting the full zloty amount of the foreign debt. This is why a gradual expenditure of investment to repay credit installments (in amounts calculated by the exchange rate existing at the time the credits were utilized), as well as appropriating the full interest accrued in investment accounts to cover foreign interest would seem expedient, as would simultaneously initiating auxiliary sources in financing an increased zloty expenditure caused by a rise in the rate of exchange.

Individual enterprises should form an ultimate source of additional revenue used to cover the zloty amount of the foreign debt since an increase in the rate of exchange promotes an increase in business activity and because their production potential rose as a result of credit and national budget utilization.

In keeping with the established economic reforms, official prices of essential raw materials and supplies are set according to average prices secured or paid in foreign currency at current exchange rates (26 Feb 82 law on pricing). Supply prices rose as a direct result of an increase in the rate of exchange--though somewhat delayed in reality--resulting in an increase in the value of the zloty reserve in the national economy. It would be proper to at least partially defray the difference in the rate of exchange pertaining to the foreign debt service by reassessing the supply of raw and material resources and commodities whose domestic prices are set according to foreign prices.

A sum totaling approximately half the value of increased reserves in the national economy was placed in a central account in the National Polish Bank [NBP] after the first jump in the rate of exchange occurring in 1982. Money accumulated in this account was used by the NBP to cover shortages in business capital and in liquidating the obligations of centralized funds held by unions. Beginning in 1983, 50 percent of the value of increased reserve funds, resultant from increased official prices, is being carried over into the national budget. It would seem appropriate, for instance, to apply half this amount directly into covering the difference in the rate of exchange rather than into the budget.

Capital good ownership in collectivized firms rose significantly in the 1970's as a result of their use of foreign credits (directly through imports and indirectly through an increase in investment potential within the national economy). This would then justify the participation of individual firms in financing the foreign debt based on the value of the capital goods in their possession.

The existing system of import settlement, described earlier, is based on cash payment. This does not mean, however, that domestic buyers, paying for goods in zloty at time of delivery, did not simultaneously profit from various forms of zloty credits from Polish banks, even though these credits were not formally or directly related to foreign credits. Foreign credit liabilities, in zloty, incurred by Bank Handlowy and foreign trade firms through importing goods rose as a result of a change in the exchange rate, while the obligations of final buyers of these goods purchased with domestic credit remained constant.

Foreign credits, due to their separation from foreign credits, were not calculated into final purchases (excluding hard currency credits leaning on self-payment), therefore, it would now be impossible to determine how many and which firms actually benefitted from them. This requires imposition of uniform charges proportionate to the value of capital goods owned.

Furthermore, one should ask whether business participation in servicing the foreign debt in zloty is to affect the cost of production or profit. In considering the answer, one should keep in mind that an increase in the cost of production would not be desirable due to the adverse affect it would have on the price level. On the other hand, in considering the efficacious utilization of capital goods, it would be desirable to impose a payment which would go into a development fund consisting partly of profits and amortization deductions. It does not seem that such payments, set at reasonable rates, imposed on firms in servicing the foreign debt would hinder necessary modernization and restoration processes.

Total monetary resources accumulated in business development funds has increased annually and exceeds all expectations, while business investment capital surpasses the estimates in the National Annual Plan [CPR]. Furthermore, starting in 1986, an important source of business investment financing will come from bank credits.

The national budget naturally would compose an ultimate source of funds in balancing deficits in the event that existing and new sources fell short of the zloty amount needed in financing the country's foreign debt. One should certainly consider whether payments made by firms for this purpose should pass through the national budget. The specific and long-term character of expenditures in servicing the foreign debt would, however, favor their separation from the national budget. Therefore, it is expedient to create a separate and unappropriated zloty fund to be used to service the foreign debt. One with its own deposit and payment plan, scrutinized and approved by the Sejm.

This type of fund, thought of as an auxiliary source, should not be made to replace basic monetary resources accumulated in investment accounts held by Bank Handlowy and foreign trade firms or contribute to the settlement of every individual credit undertaking. Instead, it would be advisable to concentrate on the fundamental sources at the disposal of Bank Handlowy. In this manner, a clear system directed by Bank Hanlowy to service the entire amount of the country's foreign debt would come into existence, one which could periodically rely on resources from this fund to offset a negative zloty balance.

NEW POLISH ECONOMIC SOCIETY OFFICERS MEET WITH JARUZELSKI

Warsaw ZYCIE GOSPODARCZE in Polish No 51/52, 22-29 Dec 85 p 3

[Text] New Polish Economic Society [PTE] officers, elected during a congress held in Katowice, met with Wojciech Jaruzelski on 14 Dec in the PZPR Central Committee building. Representing the PTE excecutive body were: Prof Zdzislaw Sadowski, chairman of the Main Administration of the PTE; Prof Czeslaw Bobrowski, honorary chairman of the PTE; Prof Jozef Pojestka, president of the Main Administration of the PTE; Prof Stanislawa Borkowska; Dr Andrzej Jaskulski; Aleksander Lukaszewicz; Dr Janusz Pikulski, vice-president of the Main Administration of the PTE; docent Tomasz Afeltowicz; Prof Stanislaw Raczkowski; master Edward Getkowski, general secretary of the PTE; Dr Andrzej Herman, secretary of the Main Council of the PTE; and master Tadeusz Luczycki, president of the Main Revisory Commission of the PTE.

Zdzislaw Sadowski reported the findings of the 14th PTE National Congress to the PZPR Central Committee First Secretary. The congress, expressing the opinion of the Polish economist community, firmly backed a further uniform continuation of economic reforms, viewing them as an essential component in strengthening the national economy. At the same time, it expressed concern and alarm over existing obstacles inhibiting desired economic and organizational conditions which would bring about an improvement in the economy.

It is the opinion of those present at the meeting that the existing economic reforms, despite having made certain improvements and gains, are not meeting desired expectations not only as a result of adverse extrinsic conditions but also because of intrinsic barriers such as bureaucratic impediments. In evidence of this fact is the attempt made at using past techniques in managing the economy which clearly proved to be ineffective.

The Polish socioeconomic situation needs to follow a consistent course in order to reform the economy. Social forces need to be strongly engaged in this effort. It is also imperative that the party and Sejm should reinforce the supervision over the course of reform to be followed, in addition to, fully utilizing various scientific groups as advisors on these matters.

The debate stressed that the battle over reforms demands the strengthening of its ideological platform. This requires firm resistance, in theory as in practice, against both conservative attitudes and those resulting from a lack of reality or showing opportunism or ignorance.

The essence of economic reforms is to bring about a new quality of socialistic attitudes towards production. For after all, these are socialist reforms which entail a proper interrelation between socialist tenets on social justice and individual and collective motivations towards progress, innovation and efficient economic management.

The work of reform demands the release of the rank and file's powers of progression and rationalization which are inherent in human behavior. The country's economic situation continues to remain difficult. Society should be fully informed of its actual state in order to combine this knowledge with the belief that there does exist a potential and necessity for efficient activity. Proof of its attainability can be shown by the progress achieved in recent years, particularly through economic reforms, despite extrinsic and intrisic obstacles.

The debate also stressed that the potential for future socioeconomic development in Poland and in fully realizing the basic principles of the socialist system is dependent on how efficiently the progress made in reforming the national economy is related to changes in social growth. This requires a departure from the process of planning a national development strategy on the basis of foreseen energy and raw material restraints. We must adopt a position allowing us to fully utilize intellectual potential and social energies in order to overcome these barriers which clearly represent economic choices which need to be made by society.

It would be unwise to retain the ineffective system of production which continues to exist within the Polish economy. The process in making structural revisions must be accelerated. The progressive changes concerned with here should not only consider areas directly affecting material production but its environment as well (it should also consider administration, trade, transportation, health services, recreation, etc.).

Those attending the meeting also accentuated the desire to intensify the work in creating and developing an economic culture within Polish society. It is also necessary to enhance the economist's position over the economy. The exact status of the business managerial cadre also needs to be guaranteed.

The PTE representatives stressed that close cooperation among the Polish Economic Society, Chief Technical Organization and other fraternal societies is imperative to society's working towards an improvement of the economy and for its efficient management.

W. Jaruzelski contributed to the discussion by confirming the will of the party leadership and of the country for the consistent continuation of economic reforms. He spoke of the various extrinsic and intrinsic obstacles hindering this course. He pointed to the main problems and to a course of action which would lead to the socioeconomic development of the country.

Marian Wozniak, Politburo member and PZPR Central Committee secretary, and Marek Holdakowski, head of the Central Committee's Economic Department, were also present at the meeting.

POLISH ECONOMIC SOCIETY CHAIRMAN REPORTS ON MEETING

Warsaw ZYCIE GOSPODARCZE in Polish No 51/52, 22-29 Dec 85 p 3

[Report given by Prof Zdzislaw Sadowski, chairman of the Polish Economic Society]

[Text] I believe that this meeting was very important for the Polish economist community. The meeting was well attended and very energetic and open. We gained the opportunity for a large-scale representation of our Society's concerns and intentions relating to the realization of its statutory aims, in addition to, coming to a friendly and profound understanding.

Our basic statutory goal is to participate in shaping the country's economic development. Therefore, our chief concerns are with issues relating to the consistent continuation of economic reforms, the ability to overcome obstacles and resistance towards their introduction, the creation and realization of a suitable development strategy, changing the economic structure of the country and in raising the standard of living.

The main topic of discussion focused on the continued difficult economic situation existing in the country. A situation which was apparently brought about by a period of prosperity paid for through credit. We must now repay this credit through the efforts of the entire country. Our western creditors, however, are not making it easy for us to do this. Despite this, we are making progress, and the key to it is economic reforms. The discussion also focused on public issues, on attitudes and perceptions, on formulating views and a trust of the future, in addition to specific everyday issues, such as, prices, wages, living conditions and jobs.

In planning a development strategy, we cannot allow ourselves to be dominated by present obstacles, such as a lack of energy and raw materials. Our strategy should not become subordinate to these shortfalls for it would only condemn the economy to continued shortages and controls. In order to avoid this, we must rely on intellectual potential, on initiative and on the energy of people at every social level and in all professions. However, there are things which we cannot overcome immediately, such as, hard currency problems which need to be solved gradually. The balance in trade, on the other hand, needs our immediate attention. We must defend against monopolizing the economy, against everything which strengthens a structure dependent on trade alone. We must reinforce business self-sufficiency within the framework of legal codes and exact principles for self-financing. This goal requires extending the activity of workers' groups in which the PTE should play a significant role.

A new wage rate must be dependent on improved behavior and discipline in the work place, in addition to, reaching an agreement whereby wages would be directly tied to output. Institutional wage agreements must play a large role in this area, even though not all the experiences associated with them have been satisfactory up to now. We need to find a suitable method of relating them to collective labor agreements. These are matters which are both extremely difficult to solve and of great importance.

Much was said concerning economic recommendations on various levels and on communicating economic knowledge and activity to society. There is much that needs to be done here, beginning with the need to educate economists themselves. The Polish Economic Society should and wishes to form a precise ideology and course for the country's future, a condition of major interest to young economists. Inherent theoretical deficiencies and the need to publish textbooks adapted to the contemporary world were also stressed during the meeting. We also gave much thought on how to better present important economic points through the mass media in order that it be both interesting and instructive.

Society should be aware of economic facts, even if they do foretell of continued hardships and impediments. Knowing all the facts is and should become a source of strength since knowledge is the basis for activity. Significant economic improvements achieved by Poland in recent years in defiance of and in spite of all hardships is a good forecast for the future.

STATUS OF ASSOCIATED BANK OF CROATIA

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 12 Dec 85 p 2

[Article by T. Kapetanic: "Liquidity Improved"]

[Text] Last year, with considerable difficulties, nine large banks in Croatia independently conducted business with foreign countries through nine separate accounts. Now, when all of the accounts have been merged into one through the Associated Bank of Croatia, Croatian banking is absolutely liquid with respect to foreign countries. It is repaying its obligations regularly, and furthermore not one of the banks has been harmed. The mutual debts of the banks in the republic have been reduced from $428 million to $53 million, with a good chance of completely eliminating the debts during the next few days, and by the end of the year at the latest.

There are still some not exactly negligible difficulties in the work of the Associated Bank of Croatia, but after a year of operation, as its president Tomislav Badovinac stated, the process of the formation of the largest bank in our country has been successfully completed.

The establishment of the Associated Bank of Croatia was awaited with considerable skepticism and suspicion, and the preparations for its establishment lasted longer than expected, but in the past 12 months its justifiability has been confirmed, since when it began to operate there was a considerable increase in the reputation and credit rating, not only of banking, but also of the entire Croatian economy, in Yugoslavia and abroad.

"In the year since the birth of this bank, there have been many problems in the republic's economy, which have also affected the banking organizations, because of large foreign exchange obligations and high illiquidity. The idea of creating the UBH [Associated Bank of Croatia] had many opponents, and the heads of banking organizations throughout the republic were the ones who expressed the greatest skepticism. It was also asserted that the creation of one more republic bank -- similar banks existed earlier in all of the republics and provinces -- was one more confirmation that monetary flows were closed off inside republic boundaries."

Some banks did not sign the Agreement on Association in the UBH until the last moment, and some have not done so to this day, and our impression is that the banks, and least of all the economy, were the main opponents of the creation of a "head" of the circulation of bank funds, especially foreign exchange funds. The new bank also had difficulties with its premises and personnel, and so no one predicted a happy future and a long life for it.

"The main reasons for the obstacles to the association were precisely the unresolved mutual relations of the banks in Croatia, and the financial institutions that had the most difficulties in operation were the ones that profited most from the establishment of the Association. The opening of a united account for business with foreign countries," Badovinac says, "was perceived by the banks as a direct attack on their autonomy and sovereignty, but it turned out that it was a correct economic move -- the liquidity of all the banks and the overall financial credit rating have improved now."

The Associated Bank of Croatia, its representatives claim, has now become a solid link in the republic's banking, a place for agreement and coordination in which even the most complex credit and financial transactions can be carried out. All obligations abroad during the past period have been settled regularly, and the frequent freezing of the accounts of individual banks because of failures to repay due debts on time has become a thing of the past. All of the banks in the republic have also settled their mutual obligations, amounting to almost half a billion dollars. The concentration of money has made it possible to keep track, on a daily basis, of the obligations of all the banks and of the use of it in a timely and efficient manner.

The current foreign exchange receipts of all of the members of the Associated Bank of Croatia have made it possible to use one account to repay $424 million to foreign countries in the first 9 months of this year, to make current payments of $615 million at the same time, and to open new letters of credit amounting to $649 million.

PUBLIC BOND TO CREATE JOBS IN BOSNIA-HERCEGOVINA

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 3 Dec 85 p 12

[Unsigned article: "Subscription to Employment Bond Begun"]

[Text] Sarajevo, 2 December (mm)--The subscription to a national bond for employment began in Bosnia-Hercegovina on 1 December and will last until the end of February 1986. This is considered here to be the news of the day and the year for Bosnia-Hercegovina.

Subscription sites have already been opened in all opstinas and local communities, and today and in the next few days, the same will be done in all of the organizations of associated labor, agricultural cooperatives, banks, and units of the JNA [Yugoslav People's Army]. It is also expected that a contribution will be made by workers from Bosnia-Hercegovina who are temporarily employed abroad and those who are currently working in other Yugoslav republics and provinces. The subscription was thus started by retirees, craftsmen, and housewives, and today and in the next few days it will be done by more than a million people employed in Bosnia-Hercegovina and outside it -- abroad.

This solidarity action, which took place after several months of thorough preparations, will secure about 40 billion dinars for the additional employment of 100,000 young workers during the next 5 years. New or renovated facilities will be opened as early as the beginning of next year, and, thanks to the money from the bond, will employ some of those who are now waiting for a job.

In some areas the subscription for the bond actually began much earlier than the scheduled date (1 December), with the explanation that one month's income from every employee, and frequently more than that, would be allocated for the creation of new jobs. The bond is to be paid at once or at most in 18 installments, and the funds paid (on the basis of promissory notes that will be distributed later) will be repaid after 5 years, with interest. For now, the direct producers, workers, are taking the lead in this great work, and they are followed by the Trade Union and many others, who are at the same time also advocating the institution of a new voluntary contribution which, along wth the bond, will also accelerate more rapid employment.

OIL, GAS PRODUCTION PLAN, 1986-1990

Zagreb NAFTA in Serbo-Croatian No 7/8, Jul-Aug 85 pp 313-326

[Article by Vladimir Aksin, geological engineer, doctor of geological science, adviser to the Professional Management Board of SOUR "Naftagas," and professor in the School of Mining Geology at Belgrade University, and Josip Secen, petroleum engineer, doctor of engineering science, chief engineer of the Production Department of the RO INA-Naftaplin, Zagreb, senior lecturer in the School of Petroleum Geology and Engineering at Zagreb University: "Status and Prospects for Development of Exploration and Production of Petroleum and Gas in Yugoslavia"]

[Excerpts] Petroleum and Gas Production

Petroleum and Gas Production in the Past

Petroleum and gas production, which had already recorded its first results in the middle of the last century, did not come into its own until after the liberation of Yugoslavia. Table 4 shows petroleum and gas production for certain periods of time.

Table 4. Production of Crude Petroleum and Natural Gas in Yugoslavia During Certain Periods of Time

Period	Duration, in years	Crude Petroleum, in tons	Natural Gas, in 10^3 m^3
1868-1918	51	7,531	[1], [2]
1919-1940	22	7,879	138,021
1941-1944	4	73,803	17,028
1945-1983	39	74,634,251	29,790,100
Total	116	74,723,464	29,945,149

---

1 Negligible quantities of gas were produced and used.

2 Includes production not registered and production in the Bujavica field 1918/1919 (estimated at 75 million m^3).

Crude petroleum production has grown since 1945 mainly as reserves have been discovered and in keeping with the development of the deposits discovered and their preparation for production, which very often has depended upon the available financial resources.

Natural gas production, however, has not kept pace either with petroleum production or with discovery of gas reserves. It has been limited by the absence of an adequate gas pipeline network for transport of the gas to consumers. Gradual construction of gas pipelines since 1958 has helped to speed up the growth of consumption and therefore the production of gas.

Yet in recent years petroleum production has been slowly declining, while gas production has fluctuated because of a mismatch among consumption, imports, and the possible domestic production.

The slow decline in petroleum production and also the reduction of known petroleum and gas reserves show that the intensity and expansion of exploration have not been sufficient or in keeping with the natural conditions. The reasons for this situation are numerous and very complicated, and their roots lead back to the problems of economic policy and the country's economic system.

Total postwar production of crude petroleum in Yugoslavia amounts to about 75.6 million tons, and that of natural gas about 29.7 billion m^3. (Footnote 1) (According to the records, however, contained in the Balance of Reserves for 1983, 31.9 billion m^3.) SR Croatia accounts for about 72 percent of the petroleum and about 56.4 percent of the gas, SAP Vojvodina about 26 percent of the petroleum and about 43.4 percent of the gas, and SR Slovenia about 1 percent of the petroleum and 0.2 percent of the gas. During 1984 petroleum production was 4.06 million tons and gas production 2.13 billion m^3, which means that petroleum production has fallen off from 1983, while gas increased.

All the petroleum and gas fields discovered so far are not, however, in production. Some have been exhausted, others are in the phase of prospecting and development, or in preparation for exploitation, but some perhaps will never even go into production, since they are too small, and the economic conditions do not obtain for their exploitation.

Up to now there have been 62 petroleum and gas fields in production in our country. Today 6 are already exhausted, so that there are 56 fields in production.

Plan for Production of Petroleum and Gas Over the Period From 1986 to 1990

The plan for petroleum and gas production in the coming period is based mainly on the operating capacities of the well-known fields, and only to a smaller extent on potential reserves.

In view of the diminished scope of explorations in the past, which we have mentioned, production of petroleum from potential reserves is anticipated only in 1989 and 1990, which would be from the deposits in the Pannonian Basin, while gas production from that same category of reserves is anticipated in 1990, and that would come from deposits located in the Pannonian Basin and the northern portion of the Adriatic Sea.

The pace of petroleum and gas production is shown in Tables 5 and 6. It is obvious that there will be a continuous reduction in petroleum production until the potential reserves are included in 1989 and 1990. That drop in production is inevitable because of the nonrenewability of the depleted portion of the reserves. To be sure, in RO INA-Naftaplin they have had great success since 1972 in efforts to increase recovery and production of petroleum using secondary methods, whereby the energy in the pools is renewed or its exhaustion halted by injection of water and/or gas.

Table 5. Pace of Petroleum Production Over the Period 1986-1990, in 10^3 tons per year

Indicator	1986	1987	1988	1989	1990
Domestic petroleum					
Naftaplin	2,830	2,595	2,464	2,416	2,355
Naftagas	1,000	1,000	1,000	1,000	1,000
Total	3,830	3,595	3,464	3,416	3,355
Petroleum from foreign concessions	135	251	329	331	651
Total	3,965	3,846	3,793	3,747	4,006

Table 6. Pace of Gas Production Over the Period 1986-1990, in 10^6 m^3 per year

Indicator	1986	1987	1988	1989	1990
Naftaplin	2,054	2,125	2,227	2,238	3,209
Naftagas	1,160	1,110	1,060	1,060	1,110
Total	3,214	3,235	3,287	3,298	4,319

The processes of water injection are being used at seven fields, while gas is being injected at the pools A_1 and A_3 in the Zutica field.

These undertakings have increased recovery from total geological reserves discovered from 25 to 38 percent, and petroleum production is almost double what it would have been had those methods not been used.

The decline in the production of domestic petroleum will be offset to a fair degree by production from foreign concessions, primarily from deposits in Angola, so that it can be said of the coming medium-term period that it will not mean a reduction, but maintenance of the same level of petroleum production.

By contrast with petroleum, over this period gas production is expected to more than double over what it is now. This primarily pertains to fields which have still not been prepared for production. These are the ones in the Drava Valley and the potential ones in the northern portion of the Adriatic Sea.

If hydrocarbon production is converted to tons of standard petroleum, on the basis of 1 ton of standard petroleum for every 1,000 m^3 of gas, then we arrive at a figure indicating a continuous growth in hydrocarbon production from $7,179 \cdot 10^3$ tons per year in 1986 to $8,325 \cdot 10^3$ tons per year in 1990, or 13.8 percent.

Production of the products of primary processing (propane, butane, pentane, primary gasoline, and ethane) and of secondary processing (ethylene and other products) which have not been covered in any detail by this paper are bound up with the production of gas.

In spite of the quite modest growth of production of hydrocarbons up to 1990, in the period that follows a larger growth of production is anticipated primarily because of the more intensive explorations which will be undertaken only in the next planning period. Substantiation of all the measures which are the basis of that promise is provided in the discussion below.

ECONOMY YUGOSLAVIA

PETROCHEMICAL PRODUCTION FROM OIL, GAS TO 1990

Zagreb NAFTA in Serbo-Croatian No 7/8, Jul-Aug 85 pp 337-344

[Article by Mirko Seler, engineer of "Petrokem," Zagreb; Sadudin Hadzialic, engineer, adviser to PO Energoinvest RO Bosanski Brod Petroleum Refinery; Ivan Mijatovic, engineer, coordinator of SOUR Naftagas, Development Department, Belgrade; and Mihael Zambeli, engineer, coordinator in RO INA Research and Development, Zagreb]

[Excerpts] Problems in supply of the necessary raw materials to the petrochemical industry have been especially evident since the curtailment of petroleum imports.

This article offers an approximate analysis of the situation in the petroleum and petrochemical industry over the planning period from 1986 to 1990 and makes it evident that raw materials can be furnished to a high degree if the method of allocation is agreed on and if producers of the raw materials discharge their obligations according to the schedule agreed on.

Table 1. Capacities in 1985 and Projected Consumption of Petrochemical Products in Yugoslavia in the 1985-1995 Period, in thousands of tons

---

* Only as a source of raw material (Organic Chemical Industry, Zagreb).

Note accompanying Table 1: The projected consumption of intermediate and primary chemical products was derived from the projected consumption of finished products. Nitrogen fertilizer capacity was derived from ammonia capacity, and the capacity for production of phosphorus fertilizer from the capacity for production of phosphoric acid.

The benzene and toluene capacities indicate possible gross production. Should the capacities of the hydrodealkylation installation at the Rijeka Refinery be used, the capacity for toluene is reduced. Should the capacity of the hydrodealkylation installation not be used, the quantity of benzene is reduced. The capacities for "other plastics" pertain to the following: polyvinyl acetate 26,000 tons per year (SR Croatia 10,000 tons per year), polyacrylates 9,000 tons per year (SR Croatia 5,000 tons per year), polyesters and alkyds 50,000 tons per year (SR Croatia 10,000 tons per year), phenolic plastics 34,500 tons per year (SR Croatia 21,800 tons per year), amino plastics 163,100 tons per year (SR Croatia 2,900 tons per year), epoxides 2,000 tons per year, cellophane 9,800 tons per year, other cellulosic plastics 19,000 tons per year, and polyurethanes 60,000 tons per year (SR Croatia 12,000 tons per year).

Table 2. Present Situation in Petroleum Refining Capacities (1985)

Work Organization	Installation	Capacity, in 000 t/yr
INA Refinery Rijeka	Atmospheric distillation	8,000
	Platforming	760
	Catalytic cracking	1,000
	Aromatics	438
	Viscosity breaking	317
	Asphalt	460
INA Refinery Sisak	Atmospheric distillation	6,700
	Platforming	800

Table 2 (continued)

Work Organization	Installation	Capacity, in 000 t/yr
	Catalytic cracking	500
	Aromatics	600
	Coking	218
	Asphalt	300
INA Lendava	Atmospheric distillation	700
Naftagas Refinery Pancevo	Atmospheric distillation	5,500
	Platforming	360
	Aromatics	30
	Catalytic cracking	1,000
	Viscosity breaking	1,000
	Alkylation	100
	Asphalt	300
Novi Sad Refinery	Atmospheric distillation	3,000
	Platforming	500
	Asphalt	220
Energoinvest Bosanski Brod Refinery*	Atmospheric distillation	2,100
	Platforming	700
	Asphalt	350
Skopje Refinery	Atmospheric distillation	2,500
	Platforming	450

Total, 000 tons	Atmospheric Distillation	Catalytic Cracking	Reforming
	28,500	2,500	3,570

---

* An atmospheric distillation plant is still under construction at Bosanski Brod with a capacity of 3 million tons per year, to be completed by the end of 1986.

In petroleum refining the investment projects planned and started have mainly been completed although quite late and with cost overruns.

Along with those installations for petroleum refining, the system of the "Yugoslav Petroleum Pipeline" has also been built, which links together all the refineries except Rijeka and Skopje.

It follows from the above that the planned sources of raw materials for the petrochemical industry have been secured, but because of the disturbances of economic flows already mentioned petroleum and gas production and refining have not developed as predicted.

Table 3. Need for Petroleum Products for Nonenergy Purposes, in millions of tons*

Products	1985	1990	1995	2000
Primary gasoline for olefins	2.10	2.10	3.00	4.00
Primary gasoline for aromatics	1.00	1.25	1.00	2.00
Other solvents, petroleum coke, carbon black	0.20	0.25	0.30	0.35

---

* Basic Premises of the Long-Range Economic Stabilization Program, p 274, Table 3.6.

Even after the detailed analysis in 1983 and publication of the Basic Premises of the Long-Range Economic Stabilization Program petroleum refining has not taken place in accordance with that document (for example, according to that document petroleum refining in 1985 ought to have been 17.5 million tons, but the plan in effect for 1985 calls for 15.1 million tons).

It is obvious from this that petroleum products, which were not set aside for nonenergy purposes, could not be produced in the projected quantities either.

This is neither the time nor the place for us to analyze those projections, but it is clear from the outset that something is wrong with those calculations.

Natural Gas

We have a somewhat different situation with natural gas. Although development of the domestic gas fields was late, the shortage of gas was made up through imports. Thus in 1984 total gas consumption (also including gas obtained from coal in Kosovo) was 5.126 billion m^3, while the stabilization program projected 6.0 billion m^3 for 1985.

Many consumers are turning toward natural gas because of its price (domestic gas), easy handling, and high efficiency. As a raw material for a certain group of chemicals it has hardly any competition, so that truly dramatic situations come about if there is a shortage or imposed reduction. This is one of the reasons why the consumers were placed in categories used in establishing the order of priority for exclusion or reduction.

We can illustrate this with the pattern of gas consumption in SR Croatia by categories of consumers.

The categories of consumers in SR Croatia result in the following order of priorities:

I. Residential and general consumption
II. INA Petrochemical Industry, Kutina--for processing
III. Technological energy
IV. Industrial heat
V. Thermal electric power plants and heating plants

Table 4. Pattern of Gas Consumption Between 1985 and 1990 in SR Croatia, in millions of m^3

Indicator	1985	1986	1987	1988	1989	1990

Quantity	340	391	362	368	305	669
%	16.9	14.9	13.0	12.6	10.4	16.5

It should be mentioned that the declared needs of consumers and distributors are greater than the available quantities indicated. The shortages could be reduced by linking the gas networks in the continental part of the country to the Adriatic part so that the surpluses of Adriatic gas might be used after the year 1990.

In order to equalize production and consumption of natural gas in SR Croatia and to smooth out the seasonal fluctuations an underground storage facility is being developed which is to go into service in 1987, but since it would take several years to fill it completely the full-fledged role of the storage facility can be anticipated only after the year 1990.

Table 5. Planned Consumption of Natural Gas for Petrochemical Production, in millions of m^3

Indicator	1986	1990
INA Petrochemical Industry, Kutina	750	750
HIP Pancevo	740	800
SMK Kikinda	220	340
INA Lendava	151	151
Total	1,861	2,041

Remark: Of these quantities, 70-84 percent is consumed in synthesis itself, and the remainder as a source of technological energy.

We see that a large portion of natural gas is being imported. According to experience to date it is not reliable enough to have one source of imports (USSR), and negotiations have therefore been going on with Algeria for quite some time so that a portion might be obtained from its sources.

Condensate occurs in the gas deposits of SR Croatia within rather broad ranges of distillation, from liquid petroleum gas to heavy gas oil. Construction of a plant for extraction of n-paraffin (35,000 tons per year) is planned in order to use 330,000 tons per year of that condensate. Other products from that separation facility would find their place among the gasolines, diesel fuel, and special oils. Should there be a shortage of this gas condensate, an alternative raw material has been provided for--the kerosene fraction from the petroleum refinery.

Primary Gasoline

Primary gasoline is the principal raw material from which olefins and aromatics are obtained, and a very wide range of products is obtained from them as secondary and tertiary derivatives. The potential for production of primary gasoline depends on many factors (motor gasoline consumption, the degree of integration of refinery technology, and so on), but the most important factor is the quantity and quality of petroleum refined. A normal trend of consumption of petroleum products and accordingly of petroleum refining was assumed in planning the development of the petrochemical industry dependent upon primary gasoline. Unfortunately, that did not occur, and the needs for chemicals have remained the same or have been increasing slightly.

Table 9. Projected Petroleum Refining in the SFRY, in millions of tons per year

1986	1987	1988	1989	1990
15.55	16.00	16.50	17.00	17.50

Table 10. Capacity for Production of Aromatics in the SFRY, in tons per year

Aromatics	Installed Capacity	Feasible Capacity	80% of Capacity	60%
Benzene	188,000	138,000	110,400	82,000
Toluene*	73,000	—	—	—
o-xylene	71,000	45,000	36,000	27,000
m, p-xylene	57,000	39,644	31,716	23,786
p-xylene	73,000	35,000	28,000	21,000
Ethyl benzene	13,000	8,980	7,184	5,388

---

* Toluene is dealkylated to benzene, but if necessary it can be obtained at the Rijeka Refinery in a quantity limited by the content of toluene in the gasoline produced by the reforming installation.

Table 11. Projected Production of Aromatics in INA, in thousands of tons per year

Benzene	72	75
Toluene	26	36
o-xylene	38	41
m, p-xylene	22	31
Ethyl benzene	5	7
p-xylene	35	35
Total	198	225

In our present situation and in the very near future we cannot anticipate any drastic increase in petroleum production, because there simply is not enough foreign exchange. According to the predictions, petroleum refining in Yugoslavia would range as shown in Table 9 over the period 1986-1990.

Assuming that primary gasoline is unconditionally set aside for the petrochemical industry in the quantity of 10.88 percent in 1986 and 11.4 percent in 1990, we would get 1,692,000 tons and 1,995,000 tons of gasoline.

Let us look at what could be obtained from those quantities of gasoline. First of all, in and of itself the quantity is not sufficient for any sort of assessment; we also need to know the principal characteristics of that raw material with respect to the possibility of its subsequent processing to produce aromatics. Only a narrow fraction (from C_6 to C_8) of hydrocarbons is suitable for that purpose. That is why it is a very worthwhile effort within the INA refineries to work out the balance for aromatics within the refinery itself, and after that to make up so-called primary gasoline for the olefins. Let us first look at the theoretical potential for production of aromatics in the SFRY.

On the basis of the assumed refining of petroleum and the share of INA at 7.5 million tons in 1986 and 8.44 million tons in 1990, preliminary analyses were made, and they showed that it is possible to produce the quantities of aromatics at the installations in Sisak and Rijeka shown in the table (assuming that the growth of motor gasoline is quite moderate).

Since it takes about 2 tons of net gasoline consumed per ton of aromatics, we can calculate that 1,296,000 tons would remain in 1986 and 1,545,000 tons of primary gasoline in 1990 for the production of olefins.

If we assume that utilization of the pyrolysis installation in Pancevo is somewhere near the average, we could obtain from those quantities of primary gasoline the quantities of the products shown in the table (from domestic pyrolysis and quantities obtained for finishing).

The ethylene produced from ethane at the pyrolysis installation of INA-Naftaplin should also be added to the ethylene coming from pyrolysis of gasoline: 32,000 tons in 1986 and 35,000 tons in 1990. Accordingly, the total quantity of ethylene might be 402,000 tons in 1986 and 476,000 tons in 1990.

If we compare the results obtained for ethylene, propylene, and C_4 with the derived projected consumption of primary chemicals, we see that they coincide with the lower values. (The first year examined in the table is 1985, but the range of the predictions is rather broad, so that they will certainly be valid in 1986 as well.) We can also take for purposes of comparison the quantity of ethylene called for under the self-management accord for 1985, which amounts to 345,000 tons, which was obtained by calculating the domestic consumption of 307,000 tons and exports of 38,000 tons.

In any case we first should meet the primary gasoline needs of domestic pyrolysis operations and let the remainder go for finishing in return for all the liquid fractions in quantities in which we have an interest.

Table 12. Use of Products in Gasoline Pyrolysis, in thousands of tons

Products	1986	1990
Ethylene	370	441
Propylene	166	198
C_4	94	112
Gasoline from pyrolysis	308	368
Remainder from pyrolysis	94	112

We have seen that the installations for producing aromatics do not have enough raw materials for 100-percent utilization of capacity, and the effort should be made to use pyrolytic gasoline for this purpose, which contains about 70 percent aromatics and contains more gasoline than the product of reforming. It is clear that this is not so simple to do, since the technology in place did not envisage such a case, but with certain efforts that source of aromatics might be used at least partially (there have been agreements to that effect for a long time between the Sisak Petroleum Refinery and Pancevo). Pyrolytic gasoline obtained from pyrolysis abroad could continue to be finished to produce aromatics and styrene. The way primary gasoline has been finished up to now is that the costs were paid in products or primary gasoline. Accordingly, if we want to obtain the recovery of all the products, we have to find a different method of payment.

Olefin Hydrocarbons From the Petroleum Refineries

In this case we will dwell only on the C_3/C_4 fraction. In our refineries the installation for catalytic cracking of gas oils is the only serious source of olefin hydrocarbons. We have seen that such installations are operating at the INA refineries in Rijeka and Sisak and are in the phase of preparation for operation at the Naftagas Refinery in Pancevo. Total refining capacities at those installations are 2.5 million tons per year.

On the basis of past experience the yield from the C_3/C_4 fraction is about 10 percent of the initial raw material. If we assume that those installations operate in 1986 with a capacity of 1.3 million tons and in 1990 with a capacity of 2.0 million tons, we can anticipate about 130,000 tons and 200,000 tons, respectively, of the C_3/C_4 fraction.

At all three refineries the capability exists for separating C_3 and C_4. Accordingly, even now olefins present in those fractions can be used for certain purposes (for example, production of the C_3-tetramer at OKI or the C_4 fraction for production of MTBE at the FSK in Zrenjanin).

According to design figures and figures from the literature, a propylene yield of about 3.5 percent of the initial raw material is possible, but in practice it has turned out that we should count on a lower percentage of 2.7 percent. In the case of the butenes we can assume 4.0 percent, while for i-butene itself we assume 1.7 percent. So, we can realistically anticipate the following from catalytic cracking installations in the coming period: between 35,000 and 54,000 tons of propylene, and the butenes might be between 52,000 and 80,000 tons, and i-butene itself between 22,000 tons and 34,000 tons. However, in reality we have a somewhat different picture. At the Pancevo Refinery the C_4 fraction will be used for production of gasoline alkylate (the installation is in the phase of preparation for operation). Industrial propylene at that refinery will be used for the production of oxo alcohols or for refinement in the fractionating tower (gradacija) for polymerization (probably at Chemical Industry Pancevo).

A self-management accord has been signed at the Rijeka Refinery concerning joint construction of a plant for production of propylene with IPLAS-Koper (production of acrylic acid). The smallest amounts of propylene are available at the Sisak Refinery, and in their forecasts the C_3 fraction will be sent to OKI for production of the tetramer or for refinement into polymer propylene.

A feasibility study is now being done concerning use of the C_4 fraction in the petrochemical industry by INA and is to show which use should be chosen.

Raw Materials for Carbon Black and Petroleum Coke

The two principal raw materials for production of carbon black and the needle-crystal form of petroleum coke are the remainder from pyrolysis and decanted highly aromatic oil from catalytic cracking. The pyrolytic remainder is certainly the best raw material, it has a high aromatic content, does not contain sulfur and has uniform characteristics. The decanted oil varies in quality and quantity as a function of the raw material refined and the operating regime in the catalytic cracking installation, so that the balances indicated here need not be feasible in practice. (Should there be a high sulfur content, the decanted oil is not suitable for production of needle-crystal petroleum coke.)

Table 13. Raw Materials for Lamp Black and Petroleum Coke, in thousands of tons

	1985		1990	
Product	Available	Needed	Available	Needed
Lamp black*	120	120	160	140
Coke	30		50	

---

* Calculated for 1985 and 1990 assuming recovery of 43,000 tons of pyrolytic remainder from finishing gasoline.

Consumption of carbon black is estimated at 60,000 tons in 1985 and 73,000 tons in 1990. Present production is 30,000 tons. Needle-crystal (premium) coke is entirely set aside for export, and this is one of the sources of foreign exchange to meet the needs of the refineries, so that there is good reason to be interested in its maximum production.

One of the limiting factors is the need for gas oils from domestic petroleum or low-sulfur imported gas oils to be refined separately in catalytic cracking and the decanted oil obtained in that way drawn off separately.

What can we conclude from this brief and rather rough survey? It is obvious that in the coming planning period there will not be any major investment projects in the petrochemical industry and that all efforts should be directed toward maximum utilization of existing capacity. The Self-Management Accord on Uniform Supply of Petrochemical and Aromatic and Olefin Products to the Market Under Equal Conditions was also drafted in 1985. We feel that this is the way that should be taken, that the producers of the raw materials and their consumers should sit down at the same table. Only in that way is it possible to overcome the crisis in the shortage of raw materials and by-products. We are convinced that in a few years there will be a certain improvement in the supply of petrochemical raw materials from the refineries, since they will cross that critical threshold in employment of primary capacities which affords 100-percent operation of secondary installations. In addition, we should mention that in the second half of this year secondary installations will go into operation at the Naftagas Refinery in Pancevo (catalytic cracking, vis-breaking, and alkylation), which certainly will improve the situation with respect to the quantity and quality of gasoline and will improve the overall relationship between the white and black products in petroleum refining. As for natural gas, there will be some increase in domestic production with the possible inclusion of gas from the Adriatic, but here we should assume an equalization of the prices of domestic and imported gas. If imports are to be larger and more reliable, supply should be secured from at least two places, so as to avoid or at least diminish the shortages in the most critical winter months.

CONSUMPTION OF OIL DERIVATIVES TO 1990

Zagreb NAFTA in Serbo-Croatian No 7/8, Jul-Aug 85 pp 369-380

[Article by Ranko Ivanovic, economist, secretary of the Business Community "Petrolunion," Belgrade; Ivan Maric, economist, specialist in business economics and business conditions, Energoinvest--RO Bosanski Brod Petroleum Refinery; Vojteh Brajcic, MA in economics, vice chairman of the Business Board of INA--"Commerce," Zagreb: "The Demand for Petroleum Products in Yugoslavia up to the Year 1990"]

[Excerpts] The demand for petroleum products in Yugoslavia, which over the past period increased at a rapid pace at annual rates between 4 and 11 percent right up until 1980, has in recent years been falling because of the well-known difficulties the Yugoslav economy has been involved with, so that today it is about 2 million tons less than in 1979, which was the record year.

Among other things, prices of petroleum on the world market, where no major shocks are anticipated, will have a considerable influence on demand in coming years. According to the predictions of experts, prices will range between $27 and $33 per barrel.

The tendency to substitute gas and coal for heating oils in Yugoslavia will continue in coming years, so that a decline in the consumption of that product group is anticipated.

Consumption of other products will grow at rates ranging from 0.4 percent (primary gasoline) to 7.1 percent (motor gasoline), with an average of 0.4 percent for all products according to the lower variant or 2 percent according to the higher one. Total petroleum product consumption in 1990 would be between 14.5 and 16 million tons.

Table 2. Petroleum Product Consumption in Yugoslavia From 1960 to 1984, in thousands of tons

Year	Gaso- lines	Inter- mediate Distil- lates	Residual Fuel Oil (mazut)	Primary Gasoline	Other Products	Total	Base Index	Chain Index

ROMANIAN PAPERS MARK BUDAPEST'S LIBERATION ANNIVERSARY

AU131726 Bucharest AGERPRES in English 1527 GMT 13 Feb 86

[Text] Bucharest, 13 Feb (AGERPRES)--In articles and travel notes the Romanian newspapers of 13 February mark 41 years since the liberation of Hungary's capital city, Budapest, from fascist occupation through the joint fight of the Romanian and Soviet soldiers.

An extensive article dwelling on Romania's participation in Hungary's liberation from fascist domination contributed in SCINTEIA TINERETULUI by Col G. Tudor shows that in terms of length and severity of fighting of forces and equipment as well as of achievements Romania's contribution to the liberation of Hungary is impressive. The Romanian Army fought in Hungary from 24 September 1944 to 15 January 1945 with over 200,000 soldiers, NCO's and officers, large operative and tactical units and various services. Next the article refers to the fights of the Seventh Army Corps of the First Romanian Army made up of over 36,000 soldiers who, alongside the troops of the Second Ukrainian Front fought around and in Budapest. During the fighting in Budapest as well as throughout the anti-fascist war the Romanian soldiers, the commands of the Romanian Army showed particular care for the life of the civilian population, helped the inhabitants with food, medicines and clothing, avoided to destroy art monuments and cultural establishments.

In an article headlined "Valiant Deeds, Unforgetable Deeds" contributed in ROMANIA LIBERA, Th. Serbanescu presents Budapest of today, its place and role in the economic, social and cultural life of Socialist Hungary. Next he highlights the contribution of the Romanian Army to the liberation of the town from fascist domination 41 years ago.

The 19 memorials and funerary monuments erected to the memory of the Romanian soldiers that sacrificed their lives for the liberation of Budapest as well as the tombs in 311 Hungarian localities stand proof of the homage paid to the Romanian soldiers.

The celebration of Budapest's liberation, ROMANIA LIBERA writes, is the celebration of a town to which we are linked by feelings of solidarity for the Hungarian people and by the sacrifice of the 11,000 Romanian soldiers and officers who died in the fights against the fascist occupants.

Marking the same event, SCINTEIA prints travel notes by publicist George-Radu Chirovici headlined "Strolling Budapest." The Romanian journalist highlights the economic and social development of the Hungarian capital city in the years of socialism. Walking through the town he stops in places recalling the fighting and sacrifices of the Romanian soldiers: the Central Post Office, Keleti Railway Station, the hippodrome, etc.

For Budapest to be what it is today, in January 1945 history also recorded the sacrifice of the 11,000 Romanian soldiers, the Romanian journalist writes.

CARCANI, MARKO, THOMAI AT FIER PARTY PLENUM

AU200856 Tirana ATA in English 0730 GMT 20 Feb 86

[Excerpt] Tirana, 20 Feb (ATA)--The meeting of the party activists in the Fier District was held. It discussed the generalisation of the experience accumulated and the problems arising from the implementation of the decisions of the 13th plenum of the Central Committee of the party on the realisation of agricultural tasks in 1986 on a frontal scale, with perfected management and organisation and a high spirit of action.

The meeting was attended also by the member of the Political Bureau of the Central Committee of the party and chairman of the Council of Ministers Comrade Adil Carcani, the member of the Political Bureau of the Central Committee of the party and vice president of the Presidium of the People's Assembly Comrade Rita Marko, the minister of agriculture, Themie Thomai and other comrades.

The report under the topic "the frontal realisation of the tasks in 1986 calls for organized actions, scientific discipline, constant and allround supervision" and the contributions underlined the achievements attained over January-February 15 in the field of economy and in agriculture in particular, in implementation of the important tasks set by the 13th plenum of the CC of the party. It was also emphasized the mobilisation and readiness of the working people to launch actions for the solution of the major tasks set in this first year of the 8th 5-year plan. By turning the actions into a method of work for the frontal realisation of the production tasks, as Comrade Ramiz Alia instructed during the visit in Mirdita District, it was stressed in the meeting, a number of actions which will provide a quick solution to the urgent agricultural problems, have been organized. Representatives of other districts also brought the experience gained from the actions launched in their own districts.

Comrade Adil Carcani, too, spoke at the meeting. After assessing the proceedings of the meeting of the party activists, he congratulated the party organisation of Fier District on behalf of the Central Committee of the party, the Council of Ministers and Comrade Ramiz Alia personally for the beginning of an organized and well run work for the solution of many economic problems through the method of actions. Such an action, he said, is also that on the reconstruction of the Vjosa-Levan-Fier big irrigation canal which will enhance the area under irrigation by some 10,500 hectares.

After the meeting, Comrade Adil Carcani went to see the work being made in the youth action for the reconstruction of the Vjosa-Levan-Fier irrigation canal. There he got acquainted with the objectives of the action as well as with the volume of work carried out by the youth, which has concluded the reconstruction work in 80 percent of the canal's length within 2 weeks. In the rally organized here, Comrade Adil Carcani congratulated the youth on their readiness to participate in this action, responding in this way to the call of the party. He also commended the youth on their intensive work and achievements in meeting all their targets, such as carrying out a volume of work planned for 3 months in 10 days' time, despite the difficulties of weather and terrain.

WOMEN'S UNION COUNCIL PLENUM CONVENED

AU251021 Tirana ATA in English 0730 GMT 25 Feb 86

[Text] Tirana, 25 Feb (ATA)--The plenum of the General Council of the WUA [Women's Union of Albania] was convened in Tirana on 24 February. It discussed the tasks set to the Women's Union organizations for the frontal realisation of the planned tasks, in implementation of the decisions of the 13th plenum of the Central Committee of the party.

The plenum was declared open by the president of the WUA General Council, Lumturi Rexha.

The report delivered by the secretary of the WUA General Council, Leonara Caro, and the contributions point out the achievements attained by the Women's Union organisations in the attainment of the objectives of the movement "Standard bearers in implementation of the teachings of Comrade Enver Hoxha." Likewise, the speakers summed up the good experience of many collectives, which are mainly composed of women and girls, which last year realised the planned tasks in all the economic and financial indices. Bearing in mind the tasks set by the 13th plenum of the CC of the party as well as the very precious instructions Comrade Ramiz Alia gave during his visit to Mirdite District, the plenum laid down concrete tasks so that the WUA respond better to the drive and mobilisation of the women for the rhythmical fulfillment of the planned tasks in all the sectors of the economy.

The plenum was also addressed by the official of the apparatus of the Central Committee of the party, Kostaq Lazri, who underlined among others the importance of putting into practice the good experience the women gained in overcoming the difficulties of last year.

The plenum also defined the new undertakings to be organised by the Women's Union organisations in the jubilee year of the 45th anniversary of the founding of the party and its 9th congress.

YOUTH UNION PLENUM CONVENED

AU190944 Tirana ATA in English 0730 GMT 19 Feb 86

[Text] Tirana, 19 Feb (ATA)--The plenum of the Central Committee of the Lyua [Albanian union of working youth], was held in one of the halls of the Museum of National History on 18 February. In the context of the very valuable instructions that Comrade Ramiz Alia gave in Mirdite district, it discussed on the tasks that the youth organisations and forums have to carry out in order to have a permanent readiness, enthusiasm and mobilisation among the youths, to enhance its militant spirit in the construction of Milot-Rreshen-Klos railway line.

Present at the plenum were also the first secretaries of the Lyua committee of the districts and military units, guests from the central mass organisations and departments, etc.

The plenum was declared open by the first secretary of the Central Committee of the Lyua Mehmet Elezi.

The report held by the secretary of the Central Committee of the Lyua Dese Jako and the contributions to the discussion pointed out the great joy and enthusiasm that the decision of the Central Committee of the party and government for the construction of Milot-Rreshen-Klos railway line by the youth has aroused among the whole youth on our country.

The plenum decided unanimously that the track of the first part of the Milot-Rreshen railway will be completed ahead of the time limit. Moreover, up to 27 April the youth will complete the construction of all the reservoirs in the pastures, planned for this year, whereas the annual plan for the opening of virgin land will be realised within this month. Besides, the opening of the canals of the Helmes reservoir, another national undertaking of the youth, will be over 1 year ahead of time. Another national undertaking of the youth will be the terraces and the plantations of fruit trees to be created in the hills of Leskovik.

YOUTH PAPER ON INFLUENCE OF 'DECADENT' MUSIC

AU102030 Tirana ZERI I RINISE in Albanian 5 Feb 86 p 3

[Article by Arben Sinoimeri: "Why Did Lindita Leave the Birthday Party?"]

[Text] A few days ago the young people of an organization at one of the general secondary schools in Tirana met together at the home of a friend to celebrate her birthday.

At the appointed time, everybody gathered together at the home of their friend. In the living room, they greeted each other, wished their friend many happy returns, and also congratulated her parents, who stayed a little while and then politely took their leave.

The afternoon went on; they laughed and told jokes, teased each other, and sang. Then one of the boys put a cassette in the tape recorder and pressed the button. The sounds of an incomprehensible song in jazz rhythm filled the room. The boy who had started the cassette began to explain which group this was, and which group this other one was, all very proud of the "culture" he had mastered. Lindita interrupted and said, "Don't you have any cassettes of our songs, or of orchestral music by a foreign composer, which we too could enjoy?" But Lindita's request hung in the air and received no reply. And, as if in fun, one of the girls whose thinking ran along the same lines as the "cultured" boy said, "Put in a cassette of that great singer F..." Lindita wished them goodnight and left, unhappy. Somebody in the room tried to calm the situation, saying, "Ah well, she's still just a peasant." The next day two or three of the friends who had joined in the birthday party behaved rather coldly to Lindita, and one of them asked if she meant to make the matter a problem for the organization.

We do not mention this matter simply out of interest, but to concentrate a while upon a problem which is apparent here and there among our young people of school age, especially in Tirana. Let us start by saying that the party and the leading youth forums themselves encourage, stimulate, and indeed demand more entertainment activities for young people.

These activities could be broadened, and could also simply consist of small groups with tape recorders or whatever equipment comes to hand. For the sake of the self-motivation of our young people, there have been cases where the excessive tutelage of parents and teachers, who imagine that parties "will spoil our young people," has been criticized. These demands have also been made, bearing in mind the high political and ideological level of our young people, who really do care that their activities should be as healthy in content and as varied in form as possible. These demands remain, because our young people are pure and of good character. Isolated instances, such as we mentioned at the beginning of this article, do not compromise their activities. Mature young people boycott such activities, as did Lindita, but they also stand up for their opinions, as Lindita did not.

So what is going on? There are young people like the boy who called Lindita a "peasant," who behave as if they were the acme of human culture. They have a banal conception of culture. Their "culture" consists of knowing the names of a few decadent singers, and their snobbish flaunting of these names is a complete sham, which has nothing to do with the true culture of our people, who admire things beautiful and progressive both at home and abroad. It is a well-known fact that there are dozens of books translated from contemporary world literature in young people's hands. The cinemas, television, radio, all perform and broadcast films, music, sports events, etc. Beauty and progressive ideas are certainly appreciated. It is also a well-known fact that our young people despise decadent, corrupting, and devitalizing art. Recognizing this, as the party has insisted, we have no reason to hide our heads like ostriches when we come across isolated cases when a few pampered young people obtain the odd cassette of decadent music from their parents.

In a discussion with some young people of the "Ismail Qemali" school, this problem was dealt with, but not with proper seriousness.

Why does the youth organization of this or any other school bow to the "authority" of parents of the kind who tolerate "pseudo-culture" instead of culture in their children?! Why does it simply stand by and watch certain alien manifestations in the dress and outward appearance of these young people who simply vegetate in the shadow of their parents? Why does it not summon the parents of these young people and confront them with the moral responsibility for their attitudes? Of course, the organization discusses these things, but its position often remains a passive one. This attitude corresponds with that of some managers and party cadres. When we raised this topic at the "Sami Frasheri" school, the comrades in charge of party work there told us that they knew nothing, and had seen nothing, though in fact these alien manifestations existed, although on a small scale. But it is better to notice them and nip them in the bud than to wait until they cause concern.

The youth organization should first of all keep ablaze the struggle against these alien manifestations, and strike them with force and strong arguments. It will do this, not bu surrendering its activities, as some people mistakenly think, but by intensifying them and improving their quality, strengthening their healthy content, and raising the quality of the work of the organization in every way. Against this background, "pseudocultured" young people will emerge more quickly into the light of day, and come to understand that they have been swimming in mud and not in clear water.

The Youth Committee of Tirana District has several times set out to struggle against these phenomena. But its organization has been poor and spasmodic, and, most importantly, has lacked decisive strength.

POLITICS ALBANIA

WELL-KNOWN WRITER CRITICIZES SCHOOL TEXTS

AU112117 Tirana ZERI I POPULLIT in Albanian 9 Feb 86 p 3

[Article by Ismail Kadare: "On Literary Reading Texts in the Schools"]

[Excerpts] The literary reading texts in eight grade primary schools and the literary anthologies in secondary schools have been under discussion for years, less in the press than in such other forums as symposia, discussion groups, party organizations, and the League of Writers and Artists.

In party documents, in the continual injunctions of Comrade Enver Hoxha, and the recent emphases of the AWP first secretary, Ramiz Alia, on higher standards and better effectiveness in all areas of life, there have been conspicuous demands for a continual and ceaseless improvement in culture. For this to happen, we need to know the present situation and be aware of our successes and failures.

What is the situation regarding the literary texts in question? Let us say frankly that it is not good and must be changed as soon as possible.

Let us look specifically at the texts under discussion. In the readers for the fourth, fifth and sixth grades, their low level is immediately apparent. In jumbled order, without any criterion of selection, appear famous and obscure authors, experienced and dilettante, modern and 19th century, Albanian and foreign. As a consequence, it will be obvious that the texts selected are of very different qualities. So, alongside such famous writers as Sh. Musaraj, J. Xoxe, Dh. Shuteriqi, D. Agolli and others, the pupil reads and learns from other writers (may I be forgiven for mentioning the names of those who, through no fault of their own, simply appear somewhere where they should not) such as A. Bishqemi, F. Malo, I. Dedi, Q. Batalli, R. Pasmaciu, K. Leli, K. Kucuku, B. Resuli, K. Koci, A. Eltari, etc., etc. Somewhere on page 111 between K. Leli and I. Dedi there appears for the first time a distinguished writer from the literature of our part, Sami Frasheri, but since his name is written only with an initial (S. Frasheri), and there is no kind of additional note, and since he turns up among young modern writers, the pupil may possibly take no notice of the great writer of the national renaissance. Naim Frasheri and Cajupi turn up for the first time on page 135 (the whole book has 168 pages), for some reason stuck between Gj. Zheji and K. Koci. Meanwhile N. Krupskaya appears as the only foreign writer, between the folk song "Mother Calls, Boys, Where Are You?", and B. Resuli, and without any indication that she was Lenin's wife.

The fifth grade reader is arranged in the same way and is of the same low level. It begins with a so-called folk song, which is in reality nothing of the kind, and has not a trace of folk inspiration: "O party you are a great mountain/ Of you my heart does sing./ You stand fast to Marxism/ So never err in anything." (As we will see later, some of these so-called folk songs are the work of feeble literateurs or workers in centers of culture, and have nothing to do with the art of the people.)

Such texts, where everything is muddled, supposedly for the sake of fidelity to the syllabus, can only create confusion in the minds of pupils, and damage their taste, and will eventually lead to their complete disillusion with literature.

In the seventh and eighth grade texts there is an effort to avoid muddle and create some sort of system. This is no doubt a step forward, but it would have been something to commend if other apparent weaknesses had been avoided. The main defect is a false picture of folk poetry. Alongside true poetry, there is banal versifying of this kind: "through our deeds we increase stature/ Forging steel musculature." It is intolerable, in a country distinguished for its great treasury of oral poetry, that our schoolchildren should be given such verses.

It is a good idea to group separately writers of the socialist era, writers of the past, and foreign writers, but within these groups there are also weaknesses, a mixture of the outstanding with the mediocre, inexcusable omissions, and the substitution of worthless writers for great ones, etc.

Now the pupil is 14 or 15 years old, at one of the most enthusiastic ages for reading. He has a more or less confused, kaleidoscopic idea of modern Albanian literature, which he has swallowed whole, grain and chaff together. He also has a truncated concept of tradition. He knows nothing of the 400 years of old Albanian literature--and does not even know the names of Barleti and Buzuku. Of the great treasure-house of folk literature he knows virtually nothing. He does not know the famous ballads, those rare pearls which our people have given to world literature, and which are eminently suitable for any anthology. As far as world literature is concerned, the editor's devotion to the commonplace and mediocre is such that its effect is noticeable here too. Although the pupil has been introduced to 25 foreign writers, he still does not know Homer, Aeschylus, Dante, Cervantes, Shakespeare, Goethe, and Tolstoy. These omissions are truly amazing, because several of these geniuses, such as Homer and Cervantes, are suitable for any school reader, and for ages our tradition had not excluded them from the school curriculum.

For the reasons mentioned above we think that a review of these textbooks is an urgent need and that it will not be so difficult as it might appear. The main thing is that the organs concerned with this work, especially the Ministry of Education and Culture, the publishing house for school books, and the authors who will be undertaking the job, understand that this is an extraordinarily serious matter, on whose success many other things depend. It is important to understand that the literature which the pupil learns in school is not something temporary and ephemeral which will be replaced later by another literature. It is true that the pupils' knowledge will be enriched later and will be augmented and supplemented but the foundation will not change.

PALESTINIAN OFFICIAL DENOUNCES AMMAN ACCORD

AU181448 Bratislava PRAVDA in Slovak 15 Feb 85 p 5

[CTK Report: "The Amman Accord Is Concession to Imperialist Forces; Restoring the Unity of Palestinian Ranks"]

[Text] Damascus (CTK Correspondent)--We regard the current situation in the Palestinian movement to be ripe for a change and have therefore come forward with an initiative aimed at restoring the unity of the Palestinian ranks. This is what Yasir Adib 'Abd Rabbuh, deputy general secretary of the Democratic Front for the Liberation of Palestine, said in an interview with a CTK correspondent in Damascus yesterday [14 February].

The so-called new political strategy of a part of the Palestinian leadership rested in the notion that it is possible to solve the Palestinian problem on the basis of cooperation with imperialist forces, which would be willing--at the price of concessions on the part of the Palestinian movement--to force Zionism to a solution acceptable to the Palestinians, Yasir Adib 'Abd Rabbuh said.

That strategy has led to a split in the Palestinian leadership and is, in substance, incorrect, because imperialism and Zionism are allies.

The events in the year that has elapsed since the signing of the so-called Amman accord between the PLO and Jordan clearly showed that the policy expressed in that accord has no chance of bringing about a genuine resolution of the Palestinian question.

The Democratic Front for the Liberation of Palestine and other Palestinian formations [zlozky] now point out that there still exists the alternative of a united Palestinian national front to the policy of the "American solution," and call for the restoration of the movement's unity on the basis of abrogation of the Amman accord. Only such unity can bring the Palestinians the fulfillment of their objectives.

CONFERENCE DISCUSSES DEVELOPMENT OF AIR FORCE PREPAREDNESS

LD230201 Prague Television Service in Czech and Slovak 1830 GMT 22 Feb 86

[No video available]

[Text] Even at this moment, the air forces are ready for an immediate take-off at predetermined airports. The process of strengthening further the high degree of readiness of all sections of the air force of the Czechoslovak People's Army requires, however, this very aspect of the responsible service to overcome with greater determination old habits and inertia and to achieve ever higher qualitative indicators in mastering new military hardware.

It was on these key issues of the everyday activity that delegates to the conference of a group [SVAZ] of communists focused their deliberations today. They stressed, among other things the demands made by the accelerating pace of scientific and technological development, accompanied by changes in the conduct of combat corps, pilots, and ground specialists. The implementation of the new tasks also calls for enterprising participation by every member of the group in applying new, creative attitudes and carrying out changes in work style and methods. What does this mean specifically for you?

[Unidentified speaker] The number of experienced pilots in the unit is dimishing and so the burden of training of the youngest generation rests on the generation of us who are in our thirties. In this we see our party responsibility toward our younger comrades who arrive from the training school very well prepared politically; but a fighter pilot trained to cope with all sorts of weather conditions both day and night can only be made at a combat unit.

To raise the effectiveness of air force training, we must make far better use of each training flight, coupled with a thorough analysis of the activity after landing.

LUCAN ADDRESSES WORLD CONFERENCE ON BROADCASTING IN PRAGUE

LD181557 Prague Domestic Service in Czech 1430 GMT 18 Feb 86

[Excerpts] The fifth world conference of radio broadcasting and television unions opened in Prague today to discuss broadening international cooperation in program exchanges. Matej Lucan, the head of a federal government's delegation and the federal vice premier, appreciated in his speech the fact that the CSSR has become the host to the delegates of the conference.

We desire, Matej Lucan went on, that space serves to promote mutually fruitful exchange of information, and broadcasts both cultural and sport programs. He went on to say that the progress in both the communication and television technology which is also spreading to an unprecedented degree also to space, would be substantially faster if the sources expended on armaments and space military systems were devoted on the development of telecommunication satellites, on a better transmission of signals and the reception of them. It is a well-known truth that when weapons are silent the arts speak. Man can thus create new values, live without fear of tomorrow. He voiced the conviction that the meeting will discuss these issues. At the same time he appreciated its intention to contribute to making the work of every radio and television station easier. This will enable the largest possible number of people the world over to know in a good time what is happening in its individual parts, to make the right decision and to be present when the interest of progress requires it.

Matej Lucan gave assurances that socialist Czechoslovakia, will spare no effort to give its support to every endeavor which influences in a progressive way the thinking of man and which leads to a resolute struggle to tackle the difficult problems facing the present day world.

BRIEFS

POLICE ACADEMY DEPARTMENT MOVED--Bratislava (CTK)--Within the framework of setting up a new and more effective system of education and upbringing within the CSSR Ministry of Interior, a second department of the Advanced School of the National Security Corps began to operate in Bratislava yesterday. It is the Department for the Protection of State Borders, which moved here from Holesov in Moravia and joins the Department of Investigations, already operating in Bratislava. On this occasion, a service-political aktiv was held at the school yesterday, which was attended by Ladislav Sadovsky and Jozef Sevc, heads of CPSL Central Committee departments, and other guests. In a festive speech, Major General Alojz Lorenc, CSSR first deputy minister of interior, spoke about the need to constantly improve the political and professional training of socialists in the needs of the National Security Corps, the Border Guards, and the troops of the CSSR Ministry of Interior in order to permit these highly educated members of the socialist security apparatus to fulfill all the exacting tasks of the CPCZ's security policy. HUSAK RECEIVES BRAZILIAN DELEGATION--Gustav Husak, president of the republic, has received a delegation of the Brazilian Congress headed by its President Jose Fragelli, which is on an official visit to Czechoslovakia, at Prague Castle today in the presence of Alois Indra, chairman of the Federal Assembly. In a friendly talk it was noted that although there is a long tradition of mutual relations between Czechoslovakia and Brazil, their current level does not correspond to the possibilities for needs of both countries. Both sides therefore expressed the wish to extend and strengthen mutual relations and cooperation in all spheres. This is the aim served by the present visit of the Brazilian senators, which means not only the renewal of official parliamentary contacts, but also promotes a better understanding of the lives of both countries' peoples. In an exchange of views on current international developments, it was stressed that both countries have a close or similar position on a number of international issues. COLOTKA INSTALLS BRATISLAVA MAYOR--At an extraordinary meeting of the National Committee of Bratislava today, its deputies elected Stefan Bartak as the new city mayor. The proposal to release Ladislav Martinak from that office at his own request in connection with his state of health and retirement was submitted by Gejza Slapka, member of the CPSL Central Committee presidium, chief secretary of the Bratislava City Party Committee, and chairman of the National Front

City Committee. At the same time, he submitted to the deputies a joint proposal of the city bodies of the CPSL and the National Front to elect Stefan Bartak to the office. The new mayor of Bratislava was installed in his office by Peter Colotka, member of the CPCZ Central Committee Presidium and Slovak premier. He paid tribute to the years-long creative activity and meritorious work of Ladislav Martinak in state and party bodies. At the same time, he voiced the conviction that the new mayor, Stefan Bartak, will make use of the existing experiences for the fulfillment of the tasks facing the Slovak capital. In recognition of his merit in promoting the development of the city, Stefan Bartak presented to Ladislav Martinak a prize of the National Committee of Bratislava. SENTENCING FOR ATTEMPTED ESCAPE--The Municipal Court in Bratislava today, after a 4-day session, sentenced Jozef Rohac and Ernest Recka, who last September, by taking a hostage and firing at border guards and National Security Corps members, attempted a forced crossing of the Czechoslovak state border into Austria. The two accused were found guilty of committing the crime of terrorism according to Paragraph 93 of the Criminal Code. Josef Rohac was sentenced to 13 years--the sentences will be carried out in the third degree of severity. The two accused were also sentenced to 3 years of protective supervision. During the main trial, Jozef Rohac and Ernest Recka, together with the rest of the accused, were answering for other criminal activity--theft, deception, parasitism, (?forgery) and unjustified leaving of the territory of the republic, which they had committed before in the district of Levica and in other places in Czechoslovakia. REFUGEE FUNNELING TO DENMARK REPORTED DIMINISHING

Copenhagen BERLINGSKE TIDENDE in Danish 7 Feb 86 p 6

[Article by Anders Wiig: "Effective Agreement With the GDR: the Stream of Refugees in Drying Up"]

[Text] The doors have actually been closed for refugee funneling through the German Democratic Republic to Denmark, the Danish Aliens Directorate states. In January, 211 refugees arrived in Denmark, as against 748 in December.

The stream of refugees into Denmark has decreased sharply following the implementation of the agreement with the German Democratic Republic to put a stop to refugee funneling to Denmark and Sweden. Now, hardly any refugees arrive in Denmark via the German Democratic Republic. In January, the number of so-called spontaneous refugees was half the number of January 1985. However, the situation is not nearly the same as the one prevailing before the flow of refugees into Denmark really gathered speed in 1984.

In the entire month of January, 211 refugees sought asylum in Denmark as against 427 in January of 1985. The drop from the last few months of 1985 is even sharper. In January of this year, the number of refugees seeking asylum in Denmark was only 28 percent of the number in December of 1985. The Danish Aliens Directorate has reported that 1281 refugees arrived in October of 1985, 1140 in November of 1985 and 748 in December of 1985.

There May Be Other Causes

The sharp decline to 211 in January may, however, have other causes than the stoppage to the funneling through the German Democratic Republic in that the numbers of refugees arriving during the winter months of 1984 and 1985 were also rather low.

In January and February of 1985, 427 and 342, respectively, arrived as against the far larger numbers during the summer and fall months. However, back in 1984, the figures for the early months of the year were quite different--53 in January and 39 in February.

Flow Via GDR Ceased

The Aliens Directorate and the National Police dare not make any predictions for 1986. However, Frede Brandt Jensen, assistant public prosecutor of the Aliens Directorate, says that the flow from the German Democratic Republic has now stopped. "At the moment, no further refugees arrive via that country. An occasional refugee seeking asylum in Denmark still arrives at Gedser but that has got no bearing on the statistics. Since the stoppage of the funneling through the German Democratic Republic, the composition of the nationalities of those seeking asylum has also changed," says Brandt Jensen. In 1985, most of the refugees seeking asylum in Denmark were Lebanese, Iranians and Poles. In January of 1986, the largest numbers came from Poland, Sri Lanka, with Iran taking up the third place. Refugees from Africa, including Ethiopia, now also count in the statistics. Most of the Iranians now entering the country are children being united with their refugee parents. This is the legal right of the children under the Danish Aliens Law. The Danish authorities do not know how these children escape from their home land which their parents left as persecuted refugees.

It was, to a large extent, Lebanese and Iranians who arrived in Denmark via the German Democratic Republic. In late 1985, the Danish and Swedish Ministries of Foreign Affairs entered into an agreement with the German Democratic Republic under which refugees seeking asylum in Denmark and Sweden would not be allowed to continue to Denmark and Sweden from the German Democratic Republic without entry permits obtained beforehand from a diplomatic representation. The result is that many refugees seeking asylum end up in East Berlin, from where they trickle into West Berlin and West Germany. Especially in West Berlin, which has got no actual entry control, the refugee problems pile up for the local government, the senate. An agreement limiting the number of refugees arriving in West Germany from the German Democratic Republic was recently concluded, but its impact on West Berlin, which has not been recognized by the German Democratic Republic as belonging to the Federal Republic, has not yet been clarified.

Most Refugees Arrived at Kastrup Airport

In January, most of the 211 refugees seeking asylum in Denmark arrived by air directly to Kastrup, by regular liner from Poland, and as far as many refugees from Sri Lanka were concerned, via the border in North Schleswig. In January, 40 arrived via Kastrup Airport. A somewhat larger number now tends to arrive via Kastrup Airport, says Police Superintendent Torben Juul Andersen. However, it is still too early to establish whether those seeking asylum in Denmark are finding new roads of escape after the closing of the doors of the German Democratic Republic to Denmark. Kastrup Airport and the North Schleswig frontier have far from taken over the position of the Warnemunde-Gedser route as port of entry for refugees from the Middle East and the Far East.

FRG EDITOR ASSESSES CULTURAL AGREEMENT, DISAGREEMENT

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 8 Feb 86 p 10

[Article by Dr Peter Jochen Winters, head of Berlin editorial staff, datelined Berlin, in February: "The War's Aftermath and Cultural Agreement--The GDR No Longer Intends to Boycott the Prussian Cultural Properties Foundation"]

[Text] A "joint protocol" is attached to the inner-German cultural agreement concluded between Bonn and East Berlin which has been submitted to the Laender for their approval. "The differing points of view regarding the cultural properties relocated in wartime remain unresolved," the protocol states. "The parties to the agreement announce their readiness to resolve issues connected with cultural properties relocated in wartime to the best of their ability." The first sentence above leaves the question of ownership of the former Prussian cultural properties out of consideration. In the FRG the "law on the establishment of a 'Prussian Cultural Properties' foundation and the transfer of assets of former Prussia to the foundation" remains in effect. The law, passed in 1957, transferred the property and other cultural assets of Prussia to the 'Prussian Cultural Properties' foundation. These include above all archive, library and museum holdings as well as other fine art and science collections, including furnishings. In the GDR, on the other hand, the 1978 "Directive Regarding the State Museum Fund of the GDR" stipulates that all museum holdings and collections which were originally situated on the present territory of the GDR and which are no longer situated there due to relocation or for some other reason shall be a part of the state museum fund.

During the first stage of the negotiations on the cultural agreement which began in November 1973, the GDR demanded that the FRG return those objects of art belonging to Prussia which had been situated on what is now GDR soil prior to 1945, particularly on the museum island in East Berlin, and that talks on cultural cooperation could not begin until that condition had been met. The FRG government categorically rejected this demand, stating that the matter of Prussian cultural properties located in the three Western occupation zones and the three Western sectors of Berlin as of 9 May 1945 had been definitively settled in accordance with Allied law and FRG law based on international law. As a result, the cultural negotiations were broken off in October 1975. It was not until fall of 1982 that the GDR relented. At that time, Honecker proposed that the Prussian cultural properties issue be left out of the discussion and that negotiations on a cultural agreement be resumed. In September 1983, the second phase of the negotiations began. In November of last year, the two sides concurred on the wording of the agreement.

The decision to leave the property issue out of the discussion (as stated in the "joint protocol") does not mean, however, that the actual holdings of the Prussian Cultural Properties Foundation will also be excluded from inner-German and international exchange programs. In fact, it was one of the primary goals of the FRG government to make sure that the Prussia Foundation was included in cultural exchange programs. The foundation includes the 14 state museums, the state library, the secret state archives, the Ibero-American Institute and the Institute for Music Research with its museum of music instruments in Berlin. The foundation, which is funded by the federal government and all the Laender and has its seat in Berlin, is not merely expected to preserve and take good care of the cultural properties in its charge but also to augment the collections and to make them available for international cultural exchange programs. Until now, inclusion of the foundation in inner-German and international cultural exchange programs has been difficult because the GDR consistently refused to participate in exhibits in the FRG or in foreign countries which also included items borrowed from the foundation. Not a few museums both at home and abroad dispensed with the participation of institutes associated with the foundation so as to be able to obtain items on loan from the GDR.

In the course of the negotiations on the cultural agreement the GDR gave its verbal assurance to boycott the foundation no longer and to base participation in events in which the foundation is also involved solely on professional --above all on conservational--criteria. What value can be attached to this assurance, only the future can tell; but first indications are that the GDR is keeping its promise.

This assurance and the wording of the first sentence of the joint protocol which was proposed by the GDR means in effect that the GDR is prepared to accept the post-war situation, i.e. that those former Prussian holdings which were located in the West as of 9 May 1945 are the property of the FRG and those which were located in the Soviet zone of occupation and in East Berlin at that time are the property of the GDR. If both sides are now prepared to honor the other's rights of ownership--and that seems to be the case--then they could sit down and talk about each other's requests for the return of items not belonging to the former Prussian properties.

This latter issue is addressed by the second sentence in the joint protocol which refers to the intention of both sides "to resolve issues connected with properties relocated in wartime to the best of their ability." Although the cultural agreement has not yet been signed and no date has been set for its signing or enactment, representatives of the two sides have already met twice to discuss the return of archive holdings relocated during the war. The FRG has an interest in getting back the Hanseatic archives of the cities of Hamburg, Lubeck and Bremen parts of which are presently located in the GDR and the GDR, for its part, is interested in Mecklenburg and Anhalt-Zerbst archives presently located in the FRG. Some of the problems encountered in these ongoing negotiations concern the exact determination of prior ownership. Items which were part of the responsibility of the ministry of science and education for the German Reich and Prussia until 1945 or of the minister president of Prussia are off limits because they are part of the Prussian cultural properties. Another problem is how to strike a balance between the requests of the two sides. There are more Western archives located in the East than there are Eastern archives in the West. Still, it should be possible to resolve the issue amicably, if a decision is made to turn to other cultural properties relocated during wartime after the archives have been dealt with.

The Bonn government has only been able to enter into negotiations with the GDR on the return of cultural properties relocated during wartime because the provisions of the 1965 property settlement law were changed. Previously, the law prohibited the transfer of cultural property belonging to public corporations, institutions or foundations established prior to 9 May 1945 in accordance with German law which did not have their last seat within the territorial confines covered by the Basic Law. Under the law, archive, library and museum holdings and other fine art and science collections, including their furnishings, belonging to such previous owners were transferred to the trusteeship of the Prussian Cultural Properties Foundation. The law further provides that a trustee is not empowered freely to dispose of such property. The Bundestag has now decided with the concurrence of the Bundesrat that the trusteeship of individual cultural items may also be terminated "if the minister of the interior decides to transfer them to individuals or agencies in the GDR or East Berlin." This new provision enables the Bonn government to return cultural items which proves that the government is serious about looking for ways "to resolve issues connected with cultural properties relocated in wartime to the best of its ability."

PZPR PROVINCIAL COMMITTEES HOLD PLENUMS

Kielce Plenum

Warsaw TRYBUNA LUDU in Polish 28 Jan 86 p 2

[Article by Tadeusz Wiacek: "Kielce: Are Youth Able to Advance?"]

[Text] At the 13th CC Plenum, a document was adopted that is entitled "Major Assumptions of PZPR Cadre Policy." Over 2 years have passed since the plenum. Therefore, it is now possible to make a more precise examination of how its provisions work, how they are implemented and how they are verified in practice. This was discussed on 27 January at a PZPR KW plenary meeting in Kielce.

During the period, changes were made in 463 administrative positions in the state and economic administration, the cooperative administration and the party apparatus. Some of these came about naturally. Most of the changes were dictated by the need to streamline the management of particular units. And why hide it--some of the management cadre were unable to cope with current demands. Moreover, the ethical-moral attitudes of some chiefs aroused serious reservations on the part of employee bodies. That the selection of the new cadres was well aimed is shown by the fact that during a cadre review made in 1985, only one person from this group received a negative evaluation. What is especially important is that the "cadre carousel" so severely criticized by society was eliminated, i.e., none of those dismissed for lack of competence or for ineffectuality were appointed to parallel positions. As was reported at the plenum, it is unfortunate that there are still cases in which these individuals are being defended both by some POP's and by employee self-governments.

It was noted that in general all party echelons have expanded their base for cadre selection. The statement was made that this is clear progress by comparison with previous years. At the same time, the still insufficient number of young people promoted to administrative positions is puzzling.

Why does this happen? The plenum revealed several answers to this question. In many party committees and enterprise administrations, "internal" opposition exists against promoting young people. In such cases, one usually hears the argument that except for professional expertise, young employees do not have extensive experience in managing groups of people. But where are they to gain such experience? Has this been facilitated for them? Such questions are perplexing.

On the other hand, one also notes the unwillingness of young people to hold administrative positions that obviously require a greater work input and responsibility above all. Although this phenomenon is uncommon, it should be considered more carefully both by party organizations and by youth organizations, for whom the struggle against the passivity of the younger generation is a primary task.

Hence what is foremost is the need for a certain amount of conscious risk taking, for the easiest thing is to close off the road to youth advancement. It was decided at the plenum that party echelons, enterprise managements and units of the state administration should verify their programs of working with young people. This is especially so since the share of youth in the cadre reserve is unsatisfactory.

The plenary meeting of the PZPR KW in Kielce was conducted by KW First Secretary Maciej Lubczynski. The tasks of the provincial party organization during the pre-congress campaign also were discussed during the deliberations. Docent Dr Zbigniew Dulewicz was appointed KW secretary for organizational affairs.

Opole Plenum

Warsaw TRYBUNA LUDU in Polish 28 Jan 86 p 2

[Article by Edward Filipczyk: "Opole: Self-Verification Helps in Work"]

[Text] The subject matter of the PZPR KW plenum held in Opole on 27 January was the implementation of the resolutions of the Party Provincial Committee in Opole following the Ninth Extraordinary Congress and the tasks of the provincial party organization preceding the 10th Congress.

The deliberations were conducted by KW First Secretary Eugeniusz Mroz. The plenum opened with reports on the implementation of the recommendations made at the preceding KW plenum.

In the report and during the discussion, that was participated in by over a dozen comrades, touched upon many subjects and at times was polemical in nature, an assessment was made of the difficult period for party work represented by almost the last 5 years. In the estimation of many of the discussants, this sort of generally critical view taken of our own work is very useful for molding the present and future of party work. During the past year, the numerical decline of PZPR ranks was halted in the Opole Province. More and more workers and farmers are joining the party, including young people as well.

It was emphasized that not only are scheduled verifications necessary, but the self-verification of the implementation of local resolutions in particular is becoming indispensable. This is also evident in the excessive number of such resolutions, causing the dissipation of means and methods and a formal, lip-service approach to them. Stanislaw Dzugaj from the OTMET Plant and Jozef Strzelecki, WKR chairman, spoke of this.

Andrzej Andraszak from Brzeg and Jerzy Wantula from Bierawa noted the need to implement recommendations made by the public that were adopted during the election campaign for the people's councils and the Sejm. Here much depends upon the attitudes of party members in the community. Party discussions prior to the 10th Congress should foster the activation of members and entire organizations on these matters as well.

The plenum confirmed the plan of the political-organizational execution of the congress campaign in the province. During the organizational portion, the former rector of WSI in Opole, Doc Dr Hab Zdzislaw Kabza was elected PZPR KW secretary by secret ballot.

Wloclawek Plenum

Warsaw TRYBUNA LUDU in Polish 28 Jan 86 p 2

[Article by Marek Badtke: "Wloclawek: Authority Is Gained Through Action"]

[Text] The peasant sees the truth and expects it from the forces that lead in the village today, said farmer Jozef Filipski from Skrwilno gmina at yesterday's (27 January) PZPR KW plenum in Wloclawek. Such a role falls to the party in the rural community. A strong party organization that takes the offensive is able to convince the community to blend skillfully vital rural matters with the assumptions of our party's farm policy.

Authority and the ability to lead are gained by the conscientious observance of the statutory assumptions of the PZPR and its active presence in the community. Do we manage, however, to accomplish this to a sufficient degree? How well do PZPR members that work in socio-vocational organizations and self-governments to popularize and mold party farm policy do? What are we doing to maintain close ties with the community?

These are only some of the fundamental questions contained in J. Filipski's speech.

The party discussion that began before the 10th PZPR Congress is a good opportunity for really taking stock of both the achievements and the shortcomings of entire POP's and particular PZPR members and candidate members. This must really be a time for serious reflection yielding useful conclusions for streamlining political work in rural areas, said those attending the plenum. Wieslaw Roman from Fabianki said that this applies as well to the party aktiv.

The results of political work in rural areas would be more significant if the aktiv utilized its potential skillfully. Wladyslaw Kubiak from Wloclawek said that it is imperative that rural young people be won over skillfully to party affairs. Meanwhile, appropriate forms of cooperation with the ZSMP, the ZMW and the ZHP have not been found in all gmina echelons.

The resolution adopted at the conclusion of the deliberations, in which CC Secretary Henryk Bednarski participated, states that the varied level of the work of rural party organizations requires that decisive action be taken aimed at equalizing the level of political work and at strengthening and expanding party elements in the rural community.

Przemysl Plenum

Warsaw TRYBUNA LUDU in Polish 28 Jan 86 p 2

[Article by Jan Miszczak: Przemysl: An Assessment of the Development of Food Production: The PZPR KW and ZSL WK Joint Plenum]

[Text] On 27 January in Oleszyce, a joint plenary meeting of the PZPR KW and the ZSL WK in Przemysl was held at the agricultural schools group, outstanding in the Przemysl Province. The topic was an assessment of the development of food production in the province from 1982 to 1985 and the directions of development of the village, agriculture, the food economy and forestry through 1990. Participants in the plenum included PZPR CC Secretary Zbigniew Michalek and ZSL NK vice president, Deputy Premier Jozef Koziol.

It was emphasized that the actions embarked upon by PZPR and ZSL echelons and elements have enabled the attainment of good results in the agriculture of the province. This is of special importance in this region, where nearly two-thirds of the population lives in rural areas and farm lands and forested lands occupy over 90 percent of the total area.

It was stressed that we must be aware that many important tasks still await our solution, especially since the potential for the further development of farm production in Przemysl is still great.

The most urgent task at present, requiring the intensified activism of members of the party and the allied party, is the ordering of land management affairs.

The discussants devoted much attention likewise to problems of improving the social-essential conditions of rural residents. Jozef Koziol referred to this in his address.

Zbigniew Michalek addressed the issues raised in the discussion, stressing that, in accordance with the decisions made by the Ninth Party Congress and the 11th PZPR CC and ZSL NK Plenum, the basic goal in the field of agriculture and the food economy continues to be the maximum satisfaction of the growing food requirements of society and, thereby, constant concern over improving the living and working conditions of the rural population.

The plenum adopted a resolution specifying the directions of action and the tasks of special importance in the program of implementing the program of development of rural areas, agriculture, the food economy and forestry from 1986 through 1990.

PZPR PROVINCIAL COMMITTEES HOLD PLENUMS

Ciechanow Plenum

Warsaw TRYBUNA LUDU in Polish 24 Jan 86 p 2

[Article by Tadeusz Woicki]

[Text] "The tasks of party echelons and organizations in implementing the socioeconomic plan for 1986 in light of the 23d PZPR CC Plenum" and the plan of action of the provincial party organization up to the 10th Party Congress was the subject matter of deliberations of the PZPR KW Plenum held in Ciechanow on 23 January.

It was noted that last year's economic results in the Ciechanow Province were positive; in many fields they were better than results on the national level. Industrial production rose nearly 10 percent. Plans in housing construction have been implemented for 3 successive years. Favorable trends have been noted in agriculture and animal husbandry, as well as in the procurement of farm products.

It was also noted, however, that the definite progress cannot obscure the weaknesses that are still evident. Considerable unused reserves of production capacities still exist, especially in the construction materials industry.

It was noted that the planned development of the region can be achieved only through a basic improvement in all fields of management.

The campaign preceding the 10th PZPR Congress was discussed in terms of the implementation of complex economic tasks in 1986.

One of the discussants said: " 2 or 3 years ago, it seemed to many of us that it is enough to democratize life in the party, to create self-government, it is enough to say: 'we are implementing the economic reform' for prosperity to be achieved all by itself. Meanwhile, attaining economic stability is a much more complex matter. Many changes ushered in by the Ninth Party Congress, such as liberating human initiative and expertise and a new approach to one's work and to responsibility, are changes that must be made within people themselves."

Leszek Miller, director of the PZPR CC Youth, Physical Culture and Tourism Department, took part in the deliberations.

Sieradz Plenum

Warsaw TRYBUNA LUDU in Polish 24 Jan 86 p 2

[Text] The subject of the PZPR KW Plenum held on 23 January in Sieradz was the principles of the creation of the concept of socioeconomic development in the province from 1986-1990 against the background of the results of the 3-year plan for stabilizing the provincial economy and in light of the 23d PZPR CC Plenum.

Both in the report and during the discussion it was noted that despite the difficulty period in which the guidelines of the 3-year stabilization plan came to be implemented, in the most important spheres of operation, these tasks were fully implemented. Moreover, the results attained by industry, construction and agriculture were markedly positive.

The plenum resolution, that took the views expressed in the discussion under consideration, stated that real premises have arisen for improving the living conditions of Sieradz Province residents. It was proposed that the principle of earmarking maximum funds for capital spending projects that are highly efficient should be adopted as the basic investment criterion. Capital spending projects in the sphere of the food economy in the broad sense were recognized as priorities in the sector structure of the economy.

During the Sieradz Plenum, in which Marek Holdakowski, director of the CC Economic Department, participated, a resolution was passed concerning the tasks facing the provincial party organization before the 10th PZPR Congress.

Torun Plenum

Warsaw TRYBUNA LUDU in Polish 24 Jan 86 p 2

[Article by Marek Badtke]

[Text] Without substantial progress in the economy, it will be difficult to raise the living standard of working people--this was the basic motif of yesterday's (23 January) plenary deliberations of the PZPR KW in Torun. During the plenum, in which Politburo member, CC Secretary Marian Wozniak participated, tasks of the provincial party organization emanating from the 23d PZPR CC Plenum Resolution were outlined.

Torun is a region where the tasks of the past 3-year plan were implemented successfully. Industrial plant workforces increased production 15 percent over 1979 figures. Both the agriculture and the construction of the province are ranked among the foremost in the country.

This, however, is no cause for complacency. This was clearly evident both in the PZPR KW Executive Board report and in the lively, and sometimes controversial, discussion. The need to increase market production volume and to accelerate export necessitates the immediate rejection of stereotypical thinking and organizational schematics in favor of cost effectiveness.

Piotrkow Trybunalski Plenum

Warsaw TRYBUNA LUDU in Polish 24 Jan 86 p 2

[Article by Paulin Plominski]

[Text] The implementation of the 3-year socioeconomic plan and the tasks of the provincial party organization in implementing this year's plan were the major topics of the PZPR KW plenary meeting held in Piotrkow Trybunalski on 23 January.

PZPR KW First Secretary Stanislaw Kolasa was the chairman. Plenum guests included Politburo candidate member, PZPR CC Secretary Jan Glowczyk and Wladyslaw Honkisz, director of the PZPR CC Cadre Policy Department.

In making the executive board report, KW Secretary Tadeusz Szarlej stressed that during the past 3-year plan, industrial production in the region rose 46 percent. The diligent workforce of the BELCHATOW ZGE had the largest share in this. Although the construction of this enormous investment only recently passed the halfway mark, the utilization of the part that has been put into service is yielding great benefits to the national economy. During the past 3 years, miners exceeded their tasks by 5 million tons of brown coal and power industry workers produced an extra 4 million megawatt-hours of electrical power. Moreover, in the production of synthetic fibers, ceramic tile and furniture, the level of highest production achieved in 1979 was exceeded. Agriculture also attained good results, and from the viewpoint of livestock and milk procurement, the Piotrkow Province was among the leading throughout Poland.

During the deliberations, a detailed operating schedule was adopted for stepping up actions aimed at economical management and the battle against waste.

All party members also must assume responsibility for implementing programs of energy, raw materials and fabricated materials conservation, acting to make this a society-wide process in all fields of life and a permanent element for improving management efficiency and increasing production. The role of the party, in cooperation with unions, the self-government and youth organizations, is to inspire and carry out the economic education of workforces in this very direction. PZPR CC Cadre Policy Department Director Wladyslaw Honkisz stressed the role of the management cadre in implementing the policy of Poland's development.

Politburo deputy candidate member, PZPR CC Secretary Jan Glowczyk addressed the preceding issues, pointing out that they are currently an especially vital element of party discussion and activities, representing the basis for the recommendations and resolutions to be adopted by the highest party forum.

A program of political-organizational activities for the pre-congress campaign also was adopted during the deliberations.

According to Alfons Koscinski, at APATOR and in many other regional enterprises, such as the Grudziadz STOMIL Plant, by cementing cooperation with the employee council, the trade union and the youth organization, the party organization is inspiring an increase in production and improved labor productivity and product quality. The party should lead in the process of transforming the consciousness of workforces and aiming to increase management efficiency.

The Torun deliberations, however, lacked a critical party analysis of such negative phenomena as the incomplete utilization of work time, lax discipline and uneconomical management. Meanwhile, party organizations should give decisive battle to these very tendencies.

At the conclusion of the discussion, Politburo member, CC Secretary Marian Wozniak gave an address. He pointed out the need for further evoking a sense of thrift in society, for accelerating efficiency processes and for increasing the export-oriented economic activity of the region.

The potential for improvement must be utilized in full before the 10th PZPR Congress. The PZPR KW Resolution adopted at the end of this point of the deliberations stresses this. The plenum also adopted program-organizational assumptions for preparations for the 10th Party Congress.

BRIEFS

GOMULKA'S WIDOW HONORED--In conjunction with the edition that is underway of the collected writings of Wladyslaw Gomulka, Henryk Bednarski, PZPR CC secretary, and Wladyslaw Honkisz, chairman of the PZPR CC Team for Merited Activists of the Workers Movement Affairs, paid a visit to Gomulka's wife and faithful life comrade Zofia Gomulka, who is celebrating 65 years of activism in the revolutionary workers movement. Since her earliest years, Zofia Gomulka has been linked with the revolutionary workers movement and has been active in the ranks of the Polish Communist Party. She spent 7 years in a sanacja prison for her revolutionary activity. During Hitler's Occupation, she took an active part in the struggle as an activist in the Polish Workers Party. After the war she participated actively in rebuilding the devastated country and in preserving Poland's statehood through her work in the PPR and PZPR. This very worthy activist of the workers movement was awarded the Ludwik Warynski honorary party badge. PZPR CC First Secretary Wojciech Jaruzelski extended sincere greetings and best wishes for her good health. [Text] [Warsaw TRYBUNA LUDU in Polish 24 Jan 86 p 1] 8536

DEFENSE MINISTRY SOCIAL SCIENCE GROUP--On 23 January in Warsaw, the first plenary meetings of the new term for the MON Council for Social Science Affairs was held. The council is an advisory and opinion-rendering organ of the national defense minister for affairs of the development of the social sciences in the military, coordinating scientific research in the armed forces and dealing above all with the use of scientific achievements to improve training work in units and military institutions. Council chairman, chief of the Polish Army Main Political Directorate, Gen of Div Tadeusz Szacilo presented council members with their acts of appointment. The meeting was devoted to the role of the social sciences in developing the moral attitudes of soldiers and society. Col Prof Mieczyslaw Michalik, GZP WP deputy chief, presented a report on this subject. [Text] [Warsaw TRYBUNA LUDU in Polish 24 Jan 86 p 2] 8536

PZPR AGITPROP JOURNAL CELEBRATED--The monthly SUGESTIE is celebrating its 15th anniversary. On this occasion, employees with many years of service received state and ministerial awards. The state distinctions were awarded by PZPR CC Secretary Henryk Bednarski. Zbigniew Rossa, deputy editor-in-chief, received the Knight's Cross of the Order of the Polish Rebirth, Helena Krzymowska received the Silver Cross of Merit and Dorota Gajowiak and Tomasz Gronau were awarded the Bronze Cross of Merit. In congratulating the recipients, Henryk Bednarski emphasized the role of the complex ideological issues treated by the publication. Wojciech Rosiecki, editor-in-chief of SUGESTIE, said: "We wish to seek answers to the questions of how to propagate party ideas innovatively and how to present its goals." The SUGESTIE anniversary also was commemorated by its publisher, the "Prasa-Ksiazka-Ruch" Worker's Cooperative Publishing House. RSW Vice President Bronislaw Stepien awarded Helena Krzymowska the badge "For Service to the RSW." [By: MZ] [Text] [Warsaw TRYBUNA LUDU in Polish 24 Jan 86 p 2] 8536

MARITIME INDUSTRIES POLICY MEETING--NPSG assumptions for 1986-1990 in the field of maritime management and the program of development of the shipbuilding industry were discussed on 23 January by the Council of Ministers Planning Commission Presidium. Participants in the deliberations included: deputy member of the CC Politburo, Chairman of the PZPR CC Maritime Commission Stanislaw Bejger and PZPR KW First Secretary in Szczecin Stanislaw Miskiewicz. The deliberations were chaired by deputy premier, Chairman of the Council of Ministers Planning Commission Manfred Gorywoda. [Text] [Warsaw TRYBUNA LUDU in Polish 24 Jan 86 p 2] 8536

ENGINEERING, S&T MEETING--Representatives of the engineering profession and S&T associations met in Lodz to discuss the role and place of the engineering profession in the Polish economy. [Text] [Warsaw ZYCIE WARSZAWY in Polish 10 Feb 86 p 2] /9365

KATOWICE JOURNALISTS MEET--Katowice is the second largest journalist center in Poland after Warsaw. Representatives of senior editorial staff and basic party organizations working in the press, radio, and TV of this region met to discuss the following: opportunities for making wider use of the ideas and initiatives generated by members of the profession, fostering attitudes of a larger sense of participation, getting members of the profession more involved in general public debates on issues, and promoting a joint effort in drafting a program for the region and the nation as a whole as the campaign for the 10th Party Congress gets underway. Deputy Politburo member and PZPR Central Committee Secretary Jan Glowczyk participated in the meeting. Wieslaw Rydygier, chairman of the "Prasa-Ksiazka-Ruch" Worker's Cooperative Publishing House, was also present. [Text] [Warsaw ZYCIE WARSZAWY in Polish 10 Feb 86 p 2] /9365

FOREIGN AFFAIRS CONFERENCE--On 10 February 1986, a conference devoted to problems affecting cooperation with other countries in the areas of cultural and scientific affairs, and also in the area of information sharing, was held at the Ministry of Foreign Affairs. The undersecretaries of state of the concerned departments and institutions took part in the conference, which was chaired by candidate Politburo member, Minister of Foreign Affairs M. Orzechowski. Deputy Minister of Foreign Affairs J. Kinast outlined the tasks awaiting them in these areas, based on recent crucial foreign policy directions.

As a result of these discussions, the most important tasks affecting cooperation with other countries were identified. [Text] [Warsaw TRYBUNA LUDU in Polish 11 Feb 86 p 2]

PZPR DRAFT PROGRAM TALKS--On 10 February 1986 the party aktiv of Krakow's youngest district, Nowa Huta, discussed the PZPR draft program being prepared for the 10th Party Congress. Taking part in the discussion were Kazimierz Morawski, chairman of the PZPR Central Review Commission, and Jerzy Jaskiernia, secretary general of PRON's National Council. The meeting underscored the fact that the draft program is very ambitious but at the same time realistic. It was also noted that pre-Congress discussions provide the means to make improvements in the draft program. [Text] [Warsaw TRYBUNA LUDU in Polish 11 Feb 86 p 2] /9365

PZPR IDEOLOGICAL CONFERENCE IN PILA--A conference of the PZPR voivodship ideological aktiv in Pila opened the pre-10th Party Congress campaign in this region. Participants at the conference--which included PZPR Central Committee Secretary Henryk Bednarski--focused their attention on the problems related to the essential principles, goals, and ideological-political functions of the PZPR Draft Program and on a Marxist-Leninist analysis of the processes of building socialism. [Text] [Warsaw ZYCIE WARSZAWY in Polish 11 Feb 86 p 2] /9365

TV JOURNALISTS, SIWAK MEET--An open meeting of the basic party organization was held at the TV editorial and program office, during which Albin Siwak, PZPR Central Committee Politburo member, met with leading television journalists, both party and nonparty members. The meeting focused on the problems of upholding socialist morality, the rule of law and attitudes of party members, and also the tasks facing the party in the area of educating the nation's youth. [Text] [Warsaw TRYBUNA LUDU in Polish 12 Feb 86 p 2] /9365

SOVIET-POLISH BORDER AREA COOPERATION--On 11 February 1986, Jozef Baryla, PZPR Central Committee secretary, received a delegation of the Lithuanian Communist Party Central Committee headed by Secretary Nikolai Dybyenko. The delegation is visiting Poland on the invitation of the Suwalki PZPR Provincial Committee. They discussed the developing contacts between PZPR and CPSU party organizations, with particular attention devoted to the long-term friendship ties and traditions of the border regions. They spoke of the tasks facing their respective party organizations in preparation for the upcoming congresses of both parties. Taking part in the discussions were Ernest Kucza, director of the PZPR Central Committee Foreign Affairs Department, and Waldemar Berdyga, first secretary of the Suwalki PZPR Provincial Committee. Soviet ambassador Wladimir Browikow was also present. [Text] [Warsaw TRYBUNA LUDU in Polish 12 Feb 86 p 2] /9365

PARTY LIBRARIANS MEETING--A conference of the National Party Librarians Caucus of the PZPR Central Committee Cultural Department was held on 12 February 1986. Representatives of university, polytechnical, and other academic libraries participated in the conference. They evaluated the current state of academic libraries and ways of developing them further. The Ministry of Science and

Higher Education submitted a report which underscored the fact that academic libraries form an integral part of the academic structure on the basis of their research achievements, that they are an essential element in the national network of research libraries, and also a fundamental link in the national system of scientific, technological, and economic information. [Text] [Warsaw TRYBUNA LUDU in Polish 13 Feb 86 p 2] /9365

POLISH-BULGARIAN TALKS--The minister of foreign affairs, Professor M. Orzechowski, met with the deputy minister of foreign affairs of Bulgaria, M. Zakhareva, on 12 February 1986. On the same day, Deputy Minister of Foreign Affairs J. Kinast and Deputy Minister M. Zakhareva signed an agreement furthering cultural and scientific cooperation between the governments of Poland and Bulgaria for the period 1986-1990. Senior officials of the Departments of Culture and Art, Science and Higher Education, and Education were present at the signing, as was the Bulgarian ambassador, G. Georgiyev. M. Zakhareva met with the director of the PZPR Central Committee Department of Culture, Professor W. Nawrocki, and also with the minister of culture and art, K. Zygulski, and with the deputy minister of science and higher education, Cz. Krolikowski. [Text] [Warsaw TRYBUNA LUDU in Polish 13 Feb 86 p 2] /9365

SUPREME COURT PARTY ACTIVITIES--Jozef Baryla, PZPR Central Committee secretary, met with the senior staff and party aktiv of the Supreme Court on 12 February 1986. The secretaries of the basic party organization informed him of party activity in the Supreme Court, while Professor Wlodzimierz Berutowicz, first president, and other senior staff members provided information on the activities of the Supreme Court with respect to Court rulings, verdicts, and crime prevention and education. These activities are aimed at enhancing the protective and educational function of the law, strengthening law and order and social discipline, and consolidating positive changes and tendencies in public life. [Text] [Warsaw TRYBUNA LUDU in Polish 13 Feb 86 p 2] /9365

BLOC JOURNALISTS VISIT OLSZTYN--A group of 30 persons, consisting of press attaches from socialist-bloc embassies and of press, radio, and TV correspondents from the same countries accredited in Poland, spent some time recently in the Olsztyn voivodship. Kazimierz Kozub, secretary of the ZSL NK [United Peasants Party Chief Committee], met with the guests. The foreign visitors were briefed on recent accomplishments and structural changes in local agriculture, which were credited to the implementation of the PZPR-ZSL agricultural policy, coordinated at the joint XI Plenum of the PZPR Central Committee and the ZSL NK. The visitors were hosted by the Provincial Committee of the ZSL in Olsztyn. [Text] [Warsaw TRYBUNA LUDU in Polish 10 Feb 86 p 2] /9365

DELEGATION OF BRAZILIAN PARLIAMENTARIANS VISIT

Parliamentarians Arrive, Meet Giosan

AU221818 Bucharest AGERPRES in English 1721 GMT 22 Feb 86

[Text] Bucharest, 22 Feb (AGERPRES)--A Bazilian parliamentary delegation led by Jose Manoel Fontanillas Fragelli, president of the Senate and the National Congress of the Federative Republic of Brazil, arrived in Bucharest on 22 February upon the invitation of the Grand National Assembly. The delegation includes Marcondes Gadelha, Jose Ignacio Ferreira and Cid Feijo Sampaio, senators.

The guests were welcomed by Nicolae Giosan, chairman of the Grand National Assembly.

The same day, the chairman of the Grand National Assembly had an interview with the Brazilian parliamentarians.

Information was exchanged on the activity and preoccupations of the legislative fora in Romania and Brazil, and joint willingness was shown to expand cooperation between the two parliaments with a view to enhancing their contribution to the development and diversification of collaboration between the two countries and peoples.

The necessity was also stressed that the parliaments and parliamentarians all over the world should make a greater contribution to the establishment of a climate of peace, security and cooperation among all nations.

Carlos Dos Santos Veras, Brazil's ambassador to Bucharest, attended.

Radulescu, Vaduva Meet Parliamentarians

AU251936 Bucharest AGERPRES in English 1844 GMT 25 Feb 86

[Text] Bucharest, 25 Feb (AGERPRES)--Gheorghe Radulescu, vice-president of the Romanian State Council, received on 25 February the Brazilian parliamentary delegation led by Jose Manoel Fontanillas Fragelli, president of the Senate and of the National Congress of the Federative Republic of Brazil, now visiting Romania.

The Brazilian parliamentarians stressed on the occasion the high consideration enjoyed in Brazil by Romania's active foreign policy, by the activity deployed by President Nicolae Ceausescu on an international plane in view of building a world of peace, understanding and collaboration among nations. At the same time the guests expressed their admiration of the Romanian people's achievements.

During the interview that proceeded in a cordial atmosphere, emphasis was placed on the good Romanian-Brazilian relations of friendship and collaboration as well as on the possibilities at hand for their further amplification in the political, economic, technological, scientific, cultural and other domains. Current aspects of the international political life were also approached.

The same day, the Brazilian parliamentarians were received by Gheorghe Oprea, first deputy prime minister. During the talk, it was assessed that the economic potential of the two countries provided a favourable framework for the manysided development of the Romanian-Brazilian development. In this context, the measures to be taken to expand the bilateral economic collaboration and cooperation, on mutually advantageous terms, were examined. The need was stressed for concluding long-term accords and understandings to give stability and perspective to the collaboration between Romania and Brazil.

The Brazilian parliamentarians had separate interviews with Ilie Vaduva, foreign affairs minister, Vasile Pungan, minister of foreign trade and international economic cooperation, and Florea Gruia, minister secretary of state at the Ministry of Agriculture and head of State Agriculture Department.

Parliamentarians Conclude Visit

AU261848 Bucharest AGERPRES in English 1727 GMT 26 Feb 86

[Text] Bucharest, 26 Feb (AGERPRES)—On Wednesday, 26 February, the Brazilian parliamentary delegation led by Jose Manoel Fontanillas Fragelli, president of the Senate and of the National Congress of the Federative Republic of Brazil, who paid a visit to Romania at the invitation of the Grand National Assembly, left Bucharest.

In a statement made prior to his departure, Jose Manoel Fontanillas Fragelli, the head of the delegation, highlighted the deciding role of the summit dialogue in the manysided development of the Romanian-Brazilian links of friendship and collaboration. In that context, the results were underscored of the visit the president of Romania, Nicolae Ceausescu, paid to Brazil in 1975, which went down as a most significant moment in the chronicle of the relations between the two countries and peoples.

The guest also emphasized the importance of the meetings and bilateral talks for a better knowledge of the concerns of the peoples of the two countries, for the further development of the ties of productive cooperation between Romania and Brazil.

In his turn, Senator Marcondes Gadelha showed that the affinities of language and culture, the joint concerns for the stepped-up growth of the national economies were factors of rapprochement between the two peoples and favoured the development of collaboration between the two countries. He also pointed to the broad possibilities of expanding and diversifying the Romanian-Brazilian cooperation in machine building, agriculture, scientific and technological research, in culture and other areas of activity.

SCINTEIA REPORT ON GORBACHEV L'HUMANITE INTERVIEW

AU131053 Bucharest SCINTEIA in Romanian 11 Feb 86 p 4

[Text] Moscow, 10 Feb (AGERPRES)--In an interview granted to the newspaper L'HUMANITE, Mikhail Gorbachev, general secretary of the CPSU Central Committee stated that Soviet society had entered a new stage of its history, the essence of which is the determined acceleration of the socioeconomic and cultural development and the utilization of all the existing resources in order to attain this target.

In his answers to some questions regarding the international situation, Mikhail Gorbachev reasserted the position of the USSR regarding the American program called "star wars" and stressed the fact that such a program is based on the erroneous concept of ensuring security primarily on the basis of technological-military means. Mikhail Gorbachev stated that the Soviet Government has in mind to ensure equal security for all by reducing arms and by achieving disarmament up to the complete elimination of all types of mass destruction weapons.

Asked whether, after the Soviet-American summit meeting in Geneva, there have been any signs of a resumption of detente in international relations, the secretary general of the CPSU Central Committee said: "In my opinion, in this respect we have to be cautious in making assessments. Yes, some signs have started to appear. The issue does not regard solely and mainly some progress attained in the field of Soviet-American relations; these relations are quite limited, peripheral, and do not refer to the fundamental problems. However, some changes in the political climate can be perceived. This fact revived some countries' hopes and confidence in the possibility of resuming detente, halting the irrational arms race, and developing a normal, peaceful international cooperation. This already means something real and substantial from a political point of view."

As regards Soviet-French relations, the general secretary of the CPSU Central Committee said that there are no particular obstacles in the path of developing these relations and that lately, some achievements have been registered in this respect. At the same time--Mikhail Gorbachev said--we would like to believe that our countries will be active partners in solving such problems of historical importance as: halting the arms race, completely eliminating nuclear weapons and other types of mass destruction weapons, and preventing the manufacture of offensive space weapons.

FENCING COACH DEFECTS--Berlin, 16 Feb (DPA)--Stefan Kaukler, the Romanian national women's fencing team coach, has defected to the West during the seven nations' tournament in Berlin. Dagobert Remuss, the women's fencing coach in the German Fencing League, confirmed this at the location of the event in the Ruhemann Sports Hall today. According to newspaper reports, the 45-year-old fencing champion asked for asylum at the Marienfelde transit camp. The camp authorities have not confirmed this. West German participants in the tournament said, in answer to questioning, that the coach had not appeared in the Romanian team's hotel again on Saturday. As was learned in the Sports Hall, Haukler had left his personal papers such as his visa, passport and airline tickets behind in the hotel. The Romanian delegation members, led by Aurelia Radina, the vice-president of the Romanian association, were not ready to respond to questioning today. The national coach is leaving his wife and daughter behind in his homeland. He comes from Transylvania. [Text] [Hamburg DPA in German 1043 GMT 16 Feb 86] /9604

EUROPARLIAMENT MP DENIES 'DOUBLE-AGENT' CHARGE--Paris, 12 Feb (AFP)--Gustav Pordea, an extreme-right MP in the European Parliament who has been accused of spying for Romania, today denied a report in a Paris newspaper that he is a double agent working for French counter-espionage. Mr Pordea, speaking in Brussels, called the report, which appeared in today's issue of the daily LIBERATION, an "absurdity." He has consulted his lawyer. The report, one month before the French legislative elections, revived allegations about the former Romanian diplomat who won his Europarliament seat as a candidate with Jean-Marie Le Pen's National Front in June 1984. Mr Pordea, aged 69, sought refuge in France in 1948 and is now naturalised. Asked about the possibility that the press accusations might result in his European mandate being invalidated, Mr Pordea replied that no proceedings had been taken against him at Strasbourg, but that a parliamentary committee would study his case at its next session, scheduled for Monday. WRITER ACCUSED OF CHAUVINISM ANSWERS CRITICS

Belgrade NOVE OMLADINSKE NOVINE in Serbo-Croatian 10 Nov 85 pp 7-11

[Interview with writer Brana Crncevic by Slavisa Lekic: "I Am Not a Nationalist, I Am Only National"]

[Text] "Any real personality has something unexpected and irregular in the proportions of his life and appearance. That is also the case in regard to him and with him. He has a black, dark surname ["CRN" in Serbo-Croatian means "black" -- a pun on Crncevic], but he is improbably and almost impermissibly blond. He is a Sremian by spirit and mentality, but a good half of him is Montenegrin. He was not born where his books and his literary birth certificate would suggest, in his native Ruma, but rather by chance, as if in passing, in the Banat Slovak village of Kovacica. He is hot-tempered and sharp-tongued, and can even be wicked and malicious, but he has a merry face and has two incomprehensibly round eyes that rejoice in the entire world and most of all in themselves. He combines the uncombinable: he is not serious about being a serious pessimistic optimist. He is simultaneously in love with dangerous and comfortable speech, with bachelors' jokes and the severity of aphorisms, and with crazy playfulness and bitter reproachful thoughtfulness. He writes easily and is carelessly scattered throughout newspapers and magazines, but in thought and expression he is a heavy-weight boxer with a good straight punch -- Brana Crncevic."

That is exactly how Borislav Mihailovic Mihiz, in his afterword to "Dreams Without Interpretations," Crncevic's just published book, "illustrated" this "lyric poet of our bitterness," "the tender modernizer of our poems for children," "a witty talkative chatterbox," "an epigrammist of the highest world rank," and his "friend of so many nighttime wanderings"... One could not look for a better introduction to an interview with one of the leading Serbian satirists, and at this time certainly the most widely read worker of Gutenberg's branch in Yugoslavia... And as far as a reason is concerned, there really are several of them: eight published books, several television plays and two theatrical ones, and 30 years of "involvement" with JEZ, POLITIKA, NIN, and DUGA, from which he was "fired and expelled more than once... and furthermore serving as a suitable 'teaching aid' so that new cadres could avoid their future" (Mihiz again).

"I have often been accused, and even today I am being accused of and abused for writing sometimes benignly and sometimes dangerously, for writing between the lines, on the left or on the right... I have not been attacked much, however, mostly because I write without hatred, which in practice means that I will not recruit a reader to hate someone along with me, but rather to become minority with me... In the second place, I rarely name a person. As the communists would say, I, like them, name a phenomenon, which is very important, because none of these people will be enough of an idiot to recognize himself and race around the city wailing that he is the one I am aiming at. This way they divide it up fraternally, and I will not let them catch me. I simply do not put myself in such a position, and they leave me in peace as long as they do, and when they need to, then they do not leave me in peace again.

Sometimes Great, Sometimes Barren

[Question] Nevertheless, you have often been in the situation of defending yourself from the "defenders of socialism."

[Answer] Starting somewhere around 1956, I worked for all of 15 years for JEZ, sometimes a little newspaper, sometimes a great one, sometimes barren, sometimes combative.. During the period from 1968 to 1972, which is considered JEZ's most significant period because of its reputation and circulation, I also acted as a sort of leader at that JEZ... It was a time of a great journalistic flourishing, a time of freedoms and quasifreedoms, real and false sharpness, conflicts between left-wingers and right-wingers, and a manifestation of national interests for the first time since the war. Accepting the themes of the times, themes that were dictated, not by the authorities or by the opposition but by the people's main intelligentsia, we really had the most devoted readers then... Karadjordjevo came, though, and soon there was a meeting at which the Belgrade, i.e. Serbian, liberals wre condemned, and it ended there... There was nothing left for me then but to take the doorknob in my hand and go out into the street...

[Question] Why did JEZ suffer?

[Answer] Actually, JEZ did not suffer anything in particular. In those years it was one of the few newspapers that accepted the struggle against the Croatian TJEDNIK and VUS, and it was the national counterpart to the Maspok. We took turns banishing each other... After the condemnation of the Serbian liberals, as opposed to the Maspok members, it was demanded that we admit that during that period JEZ was objectively a nationalist newspaper! Others admitted this; I did not. Others stayed there, and I did not! I left voluntarily, so I gave them a refusal because I knew that a time was coming, a time of people's self-humiliation, a time of renunciation, a time when people would say both what they thought and what they did not think, and I simply did not want to participate in that! I did not want to work for the kind of newspaper that it had to be in those years, and later they published some sort of announcement, I think it was from some party meeting, that in the future they would not print anything from nationalists, even if their names were Brana Crncevic and Matija Beckovic. I stopped getting that newspaper then, and I have not seen a single copy of it since.

[Question] Even today JEZ has not recovered its former glory; on the contrary, in view of its editorial concept, it is becoming more and more inclined toward the sterile cultural influence of the other humorist-satirical newspapers!

[Answer] Since I do not read that newspaper, I cannot judge the present generation of the people at JEZ, but I believe that they are doing the only thing that can be done at this time... With the exception of JEZ during those 3-4 years, and without any exception for other newspapers, I consider newspaper satire to be absolutely state-oriented. I do not have too much faith in the possibility of satire in socialist countries. I believe that it exists, that it is possible, that it goes in impulses and waves'; I believe that it has a sort of trivial, small effectiveness... At the present time the newspapers do not need satire, since it requires feuilleton handling, or some other form...

Today all the other news is more important than the jokes that you can make... A rape here, trains being stoned there, in the middle of the Assembly a delegate says that in the party's view enemies were speaking nine years ago, people talk exclusively about prices and difficulties... A joke is no longer a medicine here; it ceases to have a function, since the times are like this...

Time for Jokes

[Question] People say that it is difficult times that produce jokes!

[Answer] No, difficult times kill jokes, while vaudeville times, which is what they were until recently, produce good jokes. The best jokes are produced when freedoms pervade and surpass each other. This is why JEZ had that glorious period after 1968, because as its counterpart it had the Zagreb Maspok euphoria that automatically created room for a combative JEZ. At this time there is no chance for newspaper satire, since even statements by officials surpass it in their ingenuity.

[Question] Nevertheless, the last two "journalistic" October prizes in Belgrade were awarded to two satirists!

[Answer] These prizes are fair, but they are also a little funny. It means that the time has come to prove that we have that which we do not have. Time shows that we have paid attention to humor and satire because it is what we are said to need. It is what we do not need today, however. Among us, an ordinary cafe joke looks for a home in the newspapers, and lives there. Like the word nationalist, we take the word satire to mean the wrong things, absolutely the wrong things. This word does not mean a book, it does not mean a great satirical effort to say something about our times, and it does not mean organized thought, but rather literally a joke or an aphorism. It is being forced, however, and this is not serious work and it is what has given an awful lot of help to the impression of freedoms that actually did not exist. I cannot be repentant enough that by editing JEZ I contributed to the creation of a terrible impression that 1971 was freer than 1970 and less free than 1974, for instance.

[Question] Pjer Krizanic was an advocate of the theory that "there is no humor or satire when you agree with your government."

[Answer] I did not have any opportunity to be involved in a serious conflict with the government because I worked for newspapers that agreed with the government, since any disagreement with the government or one of its decisions was a real accomplishment. It is not a question of agreeing or disagreeing with the government; it is a question of thinking differently and proving that you have a right to think differently. Not in everything, of course, but in certain things that cause you confusion as a writer and a person, regardless of whether these are issues from the national, state, or ideological realms. Thinking differently is an ancient human right, and respect for someone else's opinions, even when that person thinks differently, is more or less the basis, beginning, or center of every serious democracy. We have had great difficulties on this level, on this human level, on the level of these different views. I am from the postwar generation that did not remember much of the SKOJ, and I recall that even then, thinking the same way was the greatest pleasure of idiots. I think that we nevertheless crossed that road, and not just in literature, but also in politics. Thinking differently, of course, is not safe, since thinking differently does not mean that those who think the same way, and who think that they are the majority even when they are the minority, will not punish, overlook, and insult you, and that the air will not become thinner for you... Thinking differently does not even mean being inclined toward opposition; it simply means thinking differently. In this regard, we have had interesting and significant writers who adopted this right, enthroned it, and still adhere to it...

Against Oneself

[Question] Have you often "thought differently"?

[Answer] I never had any major, serious conflicts that ended in my wailing and lamenting, or in great attacks and protests. Several times, you might say, I was quietly fired and brought back. My entire relationship with the state, however, is only rebellious in my writing. I calculated that I have been expelled from television six times, and brought back the same number of times, mostly by the same people. They expel people when such a time comes for them, when they are told that there are a lot of people who are not liked, and then they bring them back... I am not angry... I even understand them, since in certain situations even they are completely helpless. When the authorities are against a poem, a play, or a writer, this is part of the nature of the business of the authorities; it has always happened and it always will happen. The real problems are not when they are against you, but rather when they demand that you be against yourself and against those who support you. This collaboration is terribly painful... For instance, it happened to me once that after the opening of the comedy "Kafanica, sudnica, ludnica" at Studio 212, some serious people called and asked me to be understanding because of their difficulties, since a couple of people at the top, also serious, were against this play, and so it would be a good idea for me to disassociate myself from it and publicly attack my director, Ljubomir Draskic, in the newspapers for misunderstanding the script. Naturally, and fortunately, I did not do this, since it was equivalent to idiocy and suicide, both the suggestion and compliance with the suggestion... The play was performed more than 200 times.

[Question] Another of your comedies, "Zorzevi i zorzete," was written back in 1972, and has still not been performed anywhere.

[Answer] I wrote "Zorzevi i zorzete" after my departure from JEZ, i.e., when I had been out of work for a year, separated from the newspapers and current politics, without any self-censorship framework as in the newspapers, and I wrote this drawing-room comedy as I saw fit... It was a piece about 1968, but not particularly pretentious about anything. It was about a conflict between parents and children, and in translation, about a conflict between the authorities and the children who wanted to go out into the street... This seemed terribly dangerous to them, however; it was something that allegedly would destroy the foundations of society, and so the first time, at the Studio, it was cancelled by some ideological department of the City Committee. I was not angry at my friends at the Studio, and I even celebrated the cancellation with them. They were in a bureaucratic position, and I was in a free one. After two years, the Studio called me again, the rehearsals began, and again the same department cancelled the performance. We also tried later with the scene on Terazije, and I personally hired the actors, like Ljuba Tadic and the late Aligrudic. The performance was cancelled again, but this time with the explanation that it was being "preserved." And the fourth time, when the comedy came to the Studio's stage, the performance began to be followed by bad luck. First Soja Jovanovic broke her leg, and then Zoran Radmilovic, that splendid person, was no longer able to act, because he was literally dying on his feet... Naturally, I could not reproach him; we agreed that the play was not going well and we drank a glass or so... I was prevented by people, and he was prevented by God... He is in a worse position, however.

[Question] How did those quiet firings and expulsions from the editorial board "happen"?

[Answer] You see, there were several versions, mostly funny... For instance, POLTIKA, which I wrote for even before JEZ, remembered me at one time (and also helped me), and I was supposed to write some children's poem for some school page; and this was after a long time. And that poem reached the collegium at the POLITIKA house. One of those wise men, in reading the poem, combined his fear of the times, his age, and some misfortune of his own, and since at POLITIKA he shared responsibility with some fate of mine that was not clear to him, he decided that I should take a little vacation, and so I rested for another year... At the collegium, the poem was declared to be Stalinist, because it mentioned some man with a mustache behind a corner. Afterwards the same man approached me on the street to explain his fears to me, and as usual I was understanding. I couldn't tell them anything... They are all members of one people, absolutely amazingly arranged and divided, and they even say sincerely that they are not against me, and it is rather the times that are dictating such things. I really experience them that way...

I Do Not Fight With Ladies

[Question] After a long time, you were sharply attacked again in a newspaper a few days ago, and declared a Serbian nationalist.

[Answer] I spoke at the unveiling of the bust of Dusko Radovic, and a day or two after that VECERNJE NOVOSTI responded. The text exists, I read it, and it is not nationalistic at all, but it is to some extent national. Since we tend to confuse these two terms, and since nationalist is a pejorative word to us, I use the word national a little instead of it.... I was urged to write to NOVOSTI, but since I write letters reluctantly, and then only when I am forced, and then I write in a group along with several "enemies," and since I learned that the initials V. Sl. concealed a lady, I refrained. As a rule, I rarely fight with ladies, and I prefer to buy them drinks. In the second place, the lady did not understand what I said there at all. I said that I was glad that Dusko Radovic had consented to pose for a bust, since he was otherwise shy and it did not resemble him; and I said that it was good that he had agreed to be a monument at a time when Serbian monuments were often desecrated. I do not know why NOVOSTI took this as an abuse of Dusko's death. There is even one part that made me laugh: the lady at NOVOSTI literally says that I stated that "Dusko Radovic was a Serbian genius," which I will also tell you, and which is not anything particularly daring, and which Dusko knew better than any of all those people who wept for him without any reason, and who considered him great because we said that he was great, since they had never read his works. The lady used this and one sentence that betrays her, that really betrays her position: "Dusko Radovic is not just a Serbian genius, since if he were Serbian he would not have been anyone's." This really entertained me so much that I did not even want to respond to her because of this, since this fits in with my assertion that sometimes Serbian geniuses are not anyone's.

Change in Enemies

[Question] Nationalisms were sometimes positive, and had more than a positive historical role, but today nationalism has been named a cancer of fraternity-unity, the system and society.

[Answer] That is because we wanted it that way... No one urged us to have it that way, no one forced us... I recall, for instance, the period from 1956 to 1958, a time of so-called absolute fraternity-unity, workers' councils and self-management. The Chetniks, the Ustase, the White Guard, the Ballists, Ljotic's followers, and all of those foreign groups defeated in the war did not represent any danger at all anywhere, especially not in the newspapers. It was a time when internal party conflicts, Informburoists, and bureaucrats were much more dangerous, and when there was a weakening of the state mechanism, which was absolutely organized, and a Marxist weakening, a hunt began for enemies, and moreover reciprocal enemies. Now, obviously, a time is coming in which, in accordance with the Zagreb "White Book" and in general with the theories of the weakening of the state, the political leaderships of our six republic parties and the two provincial ones will offer each other a certain number of enemies. We have an unbelievably funny situation in which you can no longer be exceptional and believe that you can be pure in the national or Yugoslav sense of the word... If Ustase appear somewhere, Chetniks "must" also appear; if the Chetniks appear, then what about the White Guard? And, I ask you, if the White Guard appears, then what is to be done with Ljotic's [Dimitrije Ljotic was the leader of the "ZBOR" organization,a rightist group, in Serbia] ideological nest? It is a rule that if something happens in Zagreb, Ljubljana, Pristina, or somewhere else, "something" "must" also happen in Belgrade, and absolutely nothing will help here, since there must be some measure of enemies that is constantly coordinated!

[Question] Belgrade is being associated more and more with the pretensions of the Greater-Serbian bourgeoisie.

[Answer] Belgrade, as the former capital, the place from which the Greater-Serbian bourgeoisie harshly ruled, has the unfortunate circumstance of always having been the target of all those who consider Belgrade or Yugoslavia or that notorious centralism to be open to question... It seems that before the war only the Serbs had a bourgeoisie! If this has to do with one king, who was after all killed, and another king, who after all fled, and if they can be associated with old Yugoslavia, how can one make the same association for these Serbs, these new Serbs (like new dinars), who were born after the war and who do not even remember that recent bourgeoisie. This whole theory about the Greater-Serbian bourgeoisie, about Slobodan Jovanovic, about the danger of the slogan "Serbs, assemble," is in my opinion purely frankovacka [an example of Croatian chauvinism], at least in literary terms. Josip Vidmar, for instance, in my newspaper, DUGA, calmly said that it is by chance that Slovenia is in Yugoslavia, which is a creation of the Serbs and Croatians, and that the Slovenes both are and are not there! And now, since the old man was a fighter and a communist, someone will dismiss him because of his age, someone because of his years, someone will attack him, someone will not... It will still be considered that the Slovenes are interested in Yugoslavia as much as they are interested. The same thing can be ascribed to the Croatians and Macedonians and Albanians and everyone... The Serbs are the only ones laboring under the terrible accusation that the others are interested in Yugoslavia for rational reasons, and that the Serbs are in love with it and that without it they would be no one and nothing. Others are attributed with understanding of the Yugoslav creation, a critical attitude toward it, a desire for it to be better, while the Serbs are believed to want Yugoslavia just as it is at any cost, and to want to have the leading role in it always, although the times are severely refuting this... I have not seen the Serbs exercize a leading role in Yugoslavia since I was born. The worst thing in all of this is that the theory according to which the Serbs play gendarmes and force the rest to be Yugoslavs also has adherents among Serbs. I was sincerely delighted by the statement by Slobodan Milosevic in the City Committee -- and it was apparently very serious -- that the Serbian party and the Serbian people no longer have any reasons or motives to keep paying and paying for the mistakes of the Greater-Serbian bourgeoisie. This amazing penance really does make me angry. How long will a people have to pay the price for a drink in which it did not participate, a drink regarding which it does not even know what it was like? What if it was lemonade, and not some bitter drink, as the historians and literature want to claim? And why does it bother someone if I claim that I am a Serbian writer? There will always be ten idiots who think that this is terribly harmful to everyone else, and there will always be newspapers that want to think that by calling Dusko Radovic a Serbian writer, I want to use the late Dusko to destroy Yugoslavia.

A Person Wants to Be Gloomy

[Question] The politicization of literature and writers' struggle for a national language and culture are being identified more and more often with nationalism. Why do these conflict situations occur?

[Answer] There are different writers! There are great national writers who are always attacked ideologically for few or no reasons, and there are minor national writers who experienced the vaudeville period and are rushing to throw out as many national books as possible, as soon as possible. Some usable stupidity will be found, some stupid story or book, that can serve as the culminating proof for those who are uninformed and who are yelling at the top of their voices about nationalism penetrating literature. But there are amazing things... The novel by Boba Selenic, which was recently attacked by POLITIKA's increasingly more surprising cultural column and the increasingly more surprising Milos Bandic, is neither terrible, nor nationalistic, nor petty-bourgeois... It is a novel in which Boba Selenic tries through stream of consciousness to resolve some problems, some distances in time. According to Bandic, Selenic's main fault is that the hero of the book knows Slobodan Jovanovic and trusts Jovanovic a great deal. But who is this Slobodan Jovanovic that he can have such a critical influence on trends in Serbian criticism? But someone mentions him in the book, someone quotes him, and a rebellion occurs, virtually a fear of the defeat of the ideological and other forces... It turns out that Slobodan Jovanovic is one of the great national leaders of the Serbs of the present time, but the man does not have the status of citizenship here. I really do not know why there is such fear, and what point there is to these attacks upon a writer like Selenic. It is a disservice both to Serbia as a creation, to the Serbian party as a party, and to the Serbian people as a whole. Invented enemies, if they are persistently invented, can become realities in people's consciousness, and the influence that the state does not advocate can easily be extended. An attack upon a writer or upon writers must be absolutely high, esthetically literary, scientifically demonstrable, and thus above all competent...

[Question] Do you think that Milos Bandic is incompetent?

[Answer] Well, no, I don't... Bandic is quite competent; he is something quite different. He put his competence at the service of some sort of -- I do not like this kind of expression -- gloom. If a person wants to be gloomy, he succeeds... Well, let him, but I am surprised by POLITIKA, which is slowly taking over all the attacks, engaging in a struggle without checking, without 2-3 critics, without opposing views, without studies, without any right to think differently, which had not been the case from the origin of POLITIKA to the present day, until this past year... How is it that they only settle accounts wth people?

[Question] POLITIKA was also the first one to rise up against Momo Kapor, without checking the facts.

[Answer] The "Kapor incident" arose as early as the appearance of the "White Book," which was perceived here in Belgrade, although it was not published, as a jesuitical police list of possible enemies in Belgrade (mostly). It is one of a group of attempts to prove that Belgrade is an underground in which various renegades are gathered, who are involved in anti-Communist and nationalistic philosophy and literature, and the creators of that list and the members of the same ultra-leftist left-wing faction never renounced it. It is in a steel safe, but it must be proven somehow that it was drawn up for absolutely valid and major reasons, and that Belgrade is a permanently hostile city. It cannot be proven who it is hostile to or why, but the fact is that such a theory is current. And look at what is happening: because of the strength of such repeated attacks, the people who run Belgrade have to meet such demands halfway. That was also the case with Kapor. He had already criticized the authorities once, if I may not seek some milder expression, and now when the news came that he had spoken in Ontario, Moma appeared to that Salih Zvizdic, or to some higher authorities, as Moma obsessively thinks, to be a good example of how Belgrade is nourishing every sort of flower of evil, since he, after all like me, was one of the 87 people on that dark Zagreb list. Above all, Kapor is not a person who becomes involved in incidents; he is a writer in a light genre and a feuilletonist who would not sell himself there for anything, a person who probably made fun of them in his statements, and a person who is not enough of an idiot to commit a series of stupidities against things that he personally believes in, and to serve things in which he personally does not believe. The real question, however, is why this was published first of all in VJESNIK, and why an effort was made to use Kapor to prove that Serbian nationalism is more dangerous than it actually is at this time.

Tendency Toward Dramatization

[Question] Do you think that the incident has been dramatized too much?

[Answer] Too much! We at DUGA, for instance, had terrible problems in connection with Kapor. We let him explain himself, without questions, and thus come forward himself with his arguments... On Tuesday, a day or two before the publication of that issue, there were unbelievable interventions, gloomy and impermissible, and even directives to stop the issue. When the article was published, however, it turned out that there was nothing terrible in it, that his defense mechanism was self-confident, and that nothing terrible happened over there in Canada. But this demonstrated our tendency to dramatize everything; it showed this surprising habit of ours, and proved the existence of an established theory about the index of names. It was nevertheless a good sacrifice gambit in which the hunters who caught Kapor were caught themselves. In this regard the matter is now quieting down -- OK, if not Kapor, we will find some other Chetnik if we need one.

In any case, we are the world's masters of dramatization, even of what is absolutely unnecessary... In our books, people are killed again exclusively out of fear that they might be killed again, the dead are resurrected, truths are verified because they were not written down in time and because they were proscribed... A book by a good writer like Dobrica Cosic is published, and then we dramatize it so much that it reaches a point where the people, when "Kolubarska bitka" appears in the kind of situation caused by this dramatization, go there not because of the performance, but for the sake of the old Serbian uniforms... The actor didn't have to say anything; it was enough for him to wear the uniform of Commander-in-Chief Misic to get applause. That is that; this hysterically national time fits in with the hysterical needs for all freedoms, freedoms within the party, within the state, within the parliament, literature, sports...

[Question] In spite of the increasingly more significant political maturity of at least the younger generation, the democratic dialogue, and the increasingly greater tolerance, the issue of freedoms is being raised more and more often -- especially the freedom of creativity!

[Answer] A time has come in which no one knows any longer who is more capable than whom... We are so free that it is already a real insane asylum! We are either insane or free, since there is no one today who would do this to someone else... One should not forget, however, that we are a country that has adopted some sort of socialism, which won in our country through trends of some other type... The principle of the liberation of prose and poetry has lasted among us for a fairly long time, and that is why we now have all these disagreements and screaming and shouting. Those canons lasted for a long time, and now, when a book appears in which the writer questions something, instead of our reading this book in a literary manner, we shriek at the top of our voices, on all sides: this is about politics, and this destroys the foundations of the system, haven't we agreed on who won and how, and so forth... Even in terminology, literature was late in being liberated in our country, since for a long time we spoke, thought, and wrote in the language brought by self-management, in which every word was put in quotation marks. First you swear that you like this, and that you hate this, and then you attack this. These freedoms came to us fairly late and in a fairly tumultuous way, and consequently today we have freedom without accompanying criticism, or with accompanying criticism if it is negative... This freedom of ours is mostly infantile, and it acts that way... Doubts are not spoken now when everyone doubts; they are spoken in time and when everything that happens happens so suddenly and in such a confused manner that there is no longer a philosopher or scholar who can separate the real from the unreal...

[Question] These freedoms are often closely linked to the abilities of the journalist or writer!

[Answer] Freedom itself is the affair of authors... You can write for yourself, your soul, for the drawer... This freedom cannot be taken away from you, but when it comes out, then complications arise, since the question comes up of whether this freedom infringes upon some other freedoms. For instance, my own DUGA did not dare to publish an absolutely conciliatory joke of mine in this Serbian situation. But it is a natural statement that is derived from all of these polemics and discussions: "In the last war the Serbs had the most Chetniks and Partisans, and in that sense the Serbs were the ones who lost the war the most and won it the most." I really do not understand this country anymore when it comes to the national question. I understand the Serbs least of all; it is as though something atavistic came back to them, as though they masochistically enjoyed their own persecution (I am thinking, for instance, about Kosovo, especially the writers and their appeal there). They turn this into statements like the one I just made, for instance, into letters, literature, mourning, theater, without any other actions... I am not thinking about violence -- let us understand each other -- but all of this is taking place without any real protests... This is the unbelievable misfortune of the Serbian people, and thus today it is wonderful to be a Serb.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

ECONOMY GERMAN DEMOCRATIC REPUBLIC

TECHNOLOGICAL PROGRESS REQUIRED TO OFFSET HIGH ENERGY COST

East Berlin WIRTSCHAFTSWISSENSCHAFT in German Vol 34 No 1, Jan 1986 pp 32-50

[Article by Dr of Economics Gerd Schirmer, certified engineer, born 1932, deputy branch director at the Central Institute for Economic Sciences; GDR Academy of Sciences. Original title: "Economic Problems of Saving Energy, Raw Materials and Materials under the Conditions of Intensively Expanded Reproduction"]

[Text] Economizing in the use of energy carriers, raw materials and materials is a decisive criterion in comprehensive intensively expanded reproduction. An improved economizing for the objects of labor that represent a high proportion of the running production expenditures for bringing out the economic end product reflects the increasing economic efficacy of scientific-technological progress. That decreases the proportion of embodied labor in overall production both in terms of the objects of labor and the consumption of the means of labor. "The proportion of value derived from raw materials and semifabricates has to decline when labor productivity is boosted because this productivity relative to those materials simply is being revealed by their value reduction."[1] For our future economic development "the salient point is to ensure economic growth permanently through comprehensive intensification. That calls for setting high aims for boosting labor productivity and calls for further reducing production consumption."[2]

Savings in energy, raw materials and material do, however, not bring about reductions in production consumption at an equal measure. It contains still other cost components which in their entirety are greatly influenced by the social division of labor. New levels in the socialization of production and labor also and new forms of the social division of labor must thus help reduce the overall specific production consumption.

"From the growth-promoting function of the saving of energy, raw materials and materials a number of basic problems and issues in reproduction theory are derived,"[3] which are addressed by the considerations that follow. Significant connections are brought out with reference to energy. Rapid and deep changes in the reproduction conditions exercise special effects on economic growth. Stimulating the growth process through rational energy use thus is of fundamental importance for the transition to comprehensive intensification.

On the Effect of Saving Energy, Raw Materials and Material in the Economic Reproduction Process

An important criterion of intensively expanded reproduction is the reduction of the ratio between the expenditure in live and embodied labor and the economic outcome, expressed in produced national income. "Saving live labor and material, making a better use of available fixed assets and investments--that together only gets us what we need. The point always is the total economic outcome in proportion to total resource expenditures. Our production growth will in the future depend mostly on efficiency improvements. Thus the output must rise faster than the expenditure in embodied and live labor."[4]

The ultimate aim of socialist production is an ever better need satisfaction of all society. That implies meeting the needs in energy carriers, raw materials and materials for it, and this in such a way that need satisfaction is achieved as "a definite result by means of the lowest costs."[5] The key for it "lies not mainly in broadening the raw material base, but mainly in its ever more rational utilization."[6]

This entails complicated and, in part, contradictory processes. As Marx observed, "with the scale of production and the increased productive force of labor, through cooperation, division, machinery and so forth, there also grows the mass of raw materials, semifabricates, and so forth that enters into the everyday reproduction process."[7] One can, to be sure, not derive from that remark any proportionality between production and labor productivity and energy, raw material and material consumption, as if they were to show identical growth rates or their growth rates were to be governed by a definite ratio. Whereas primarily in the capitalist industrial countries the growth rates of production and primary energy consumption still came to a ratio of circa 1:1 up to the late 1970's, in the GDR primary energy consumption was much slower than the produced national income ever since the early 1960's. This reflects the results of an effective use of nature as a resource and of resources-saving production. To the extent that science and technology become production-effective, the consumption of energy, raw materials and material grows more slowly than production and may at times even decline absolutely. That is primarily the case when extensive tendencies in preceding reproduction and production cycles are replaced by intensive ones.

These savings in energy, raw materials and material compared with the produced national income growth decisively determine now and in the future the dynamics in the economic growth of the GDR. This pertains not only to releasing these resources in their material-substantive form, but also to the relative or even absolute reduction in running production costs, i.e. the release of operational expenditures. "By releasing capital," Marx remarked, "we mean that some of the total product which previously had to be turned back into constant or variable capital becomes available and surplus if production is to continue within the frameworks of the old scales."[8] If production, however, is to proceed on a higher scale and be intensively expanded, the available resources, due to their productive reusability, become a source of economic growth. "This qualitative growth takes full effect when transformed into quantitative growth. The point then is not only reducing production consumption and saving working hours, but also to release potentials and means this way that would ensure dynamic growth."[9]

The releasing of energy carriers, raw materials and material from the preceding production and reproduction process for the subsequent one at a higher scale is, at comprehensive intensification, no longer comparable to the scale of previous reproduction periods. That is why opinions that confine themselves to assuming that a better use made of raw material had always been the concern of technical improvements or new technologies miss the qualitatively new science and technology requirements. That can bring it about that priorities for scientific-technological developments decisive for a higher economy of the running expenses for embodied labor are underestimated and problems in savings and their reproductive effects are not recognized early enough. This might bring it about that the scientific-technological progress may indeed release resources which then, however, are not converted into growth, not realized in the sense of improved need satisfaction.

In drawing on the experiences with intensification, Erich Honecker at the seventh SED Central Committee session remarked "that it is possible for us over a longer period to increase production and national income while reducing the consumption of energy, raw materials and material in absolute figures."[10] From this it can be derived that the proportion of saving these production elements in economic growth not only has to increase, but even predominate, compared to an expansion of them, and help make intensification comprehensive.

That precisely does not make it very sensible to look at the rational use of these elements, let alone at economizing in them, solely as physical units, detached from the economic effect of manpower and working tools. It is equally inadmissible to judge energy saving apart from cost trends in other labor objects because that might ignore substitutions within labor objects that might have been triggered by the savings in one resource. Only through interdependence among all production elements is economic efficiency enhanced and is the needed contribution to economic growth achieved by saving energy, raw materials and material. That in turn is the precondition for "permanently, replicably, and irreversibly reducing the running costs in live and embodied labor that is required for the future production growth."[11]

In view of the high costs of social labor and the price hikes for raw materials, especially energy raw materials, since the early 1970's, the dominance of energy saving over making more energy available receives a crucial importance.[12] That not only put a brake on a higher physical energy consumption, it also reduced the increase of energy expenditure. Thus the rational energy use has an impact on the growth ratio between production consumption and produced national income in favor of the produced national income.

Energy saving as the outcome of a rational energy use throughout the whole chain from producing primary energy carriers, their conversion and refinement, all the way to the use of energy in production and consumption reflects the reduction both of the physical consumption of energy and of the energy costs. We speak of energy saving when energy growth goes more slowly than does the produced national income and this tendency then improves economic efficiency, which presupposes linking the energy savings in volumes with reducing specific energy costs and keeping the social labor expenditure for energy savings down below that for an additional allocation of an identical energy volume. That way alone can energy saving contribute to reducing the socially necessary labor expenditures for producing the economic end product, thereby fulfil its function in terms of intensively expanded reproduction, become an economic growth source, and create the prerequisites for its reproduction.

Yet the energy saving chain starts with the saving of resources.[13] It releases live and embodied labor that would otherwise be needed for allocating extra energy carriers and for measures in environmental production. Saving thus is more than just saving energy in physical units. It amounts to saving of social labor and, hence, of working hours that can then be redistributed over other sectors and branches for improving need satisfaction in terms of the economic strategy. The "real economy" of this processes does not show until working hours are saved through saving material resources.[14] That mobilizes the capacities needed to transform the saving of physical resources into economic growth.

The socializing effect of saving is seen in the diversely interlinking processes. While already the allocation of these resources suggested a high degree of social division of labor among the sectors carrying out the chief process with the preparatory sectors such as machine building and transportation, the strategic conception for turning savings into the predominant element in meeting demands for circulating funds and thus deriving the major portion of economic growth from it connects the saving with all the sectors and phases of the social reproduction process.

It takes socialist property relations, for all that, to convert saving into social progress. "Capitalism, in contrast to socialism, cannot convert scientific-technological progress into values for men because of the property relations in private capitalist appropriation, its maximizing of profits."[15] Based on socialist property relations, energy, raw materials, and material are used for the sake of social interests. That then also provides socialism with more opportunities and more leeway for using the complementary function of saving and additional allocation of resources for a better need satisfaction of society, it being integrated in a concept for social progress.[16]

By using the advantages of the socialist production relations new economizing potentials are seen and become subject to long-term planning. The saving of energy, raw materials, and material on the production and consumption levels, including the reuse of their waste-products as secondary energy and secondary raw materials and their recycling into new production elements, not only alters the social division of labor but, with it, the resorting to social labor in the investment, basic assets, material, and labor-intensive initial stages in allocating circulating funds.

Moreover, the saving of energy, raw materials, and material simultaneously creates better conditions for the reproduction of nature as a source of social wealth. This not only cuts back the infringements on nature for gaining extra raw materials, resources also are set aside for future reproduction periods where they then will achieve higher growth effects through more effective technologies. Also reduced are environmental stress from noxious substances from raw material refining and from higher labor efforts to prevent and eliminate environmental damage. The saving of energy, raw materials and material thus becomes "a crucial condition for an ever better protection of nature and its resources."[17] That also turns resources-saving growth into the most effective environmental protection.

Marx made a highly relevant remark in this connection to the effect that it is by no means the same thing "whether I produce (1) with half as much live and embodied labor as much of a product as before or (2) with the same amount of labor twice as much as before. In the former instance, labor--in live and embodied form--is released that can then be used elsewhere." Yet this release of labor constitutes an "augmentation of wealth" and "has quite the same effect as if such excess capital had been achieved through accumulation, while it saves the labor for accumulation."[18] However, not until by saved resources existing needs are better or new needs are altogether, satisfied, such saving reinforces the process of intensively expanded reproduction and thus meets its socioeconomic goal. To that end it is necessary to link the scientific-technological efforts to release resources with those toward creating favorable conditions for their reuse. This calls for a long-term implementation of the social labor redistribution to convert savings into economic growth and reduce the socially necessary labor costs for providing the economic end product. Therefore one must complement the saving computations in terms of natural units by economic cost/benefit evaluations.

Savings fulfil their function as growth source when they hold back production consumption vis-a-vis the produced national income, ease the economic investment and accumulation capacity, and improve economic efficiency. The growth rates in Tables 1 and 2 show the dynamics in this process. It is mainly reflected by the high reduction rates in the intensity of production and primary energy consumption and of the specific consumption of economically significant energy carriers, raw materials, and materials.

Table 1: Average Annual Growth of Significant Economic Parameters (Percentage)

	1965/1960	1970/1965	1975/1970	1980/1975	1984/1980	1980/1960

Whereas between 1960 and 1978 production consumption based on 1980 prices at an annual 5.8 percent increased faster throughout than the produced national income at 4.6 percent, this tendency reversed itself as of 1979. While the annual average growth rates of produced national income to production consumption to volume in primary energy consumption up to the mid-1960's came roughly to 1:1.7:0.9, these proportions improved up to the mid-1970's to 1:1.1:0.3, and up to the mid-1980's, to 1:0.3:0.1. This development reflects the results of increasing intensively expanded reproduction. While in the earlier period under consideration the volume in primary energy consumption still had to increase by an annual average of 0.9 percent to get a 1-percent national income growth, a smaller 0.3 percent did it for the second period, and in the 1980's thus far more than 90 percent of economic growth has come out of energy saving. The economic growth attained from phyiscal primary energy saving is shown in Table 3.

Table 3: Economic Growth Attained from Physical Primary Energy Saving (Percentage per annum)

1961-1965	1966-1970	1971-1975	1976-1980	1980-1984

Source: Computed from "Statistisches Jahrbuch der DDR 1983," op. cit., pp 238-239; "Statistisches Taschenbuch der DDR 1985"; op. cit., pp 25, 57.

By an average annual increase of production consumption of only 1.6 percent between 1981 and 1984, a 4.4 percent increase in produced national income per annum was achieved. In 1982 economic growth compared with 1981 even showed an absolute drop in production consumption of nearly 1 percent. That reversed the ratio of the annual average growth rates between produced national income and production consumption in the outcome of the cost/benefit ratio of 0.82:1 between 1960 and 1980 to 2.75:1 since the early 1980's.

As Erich Honecker observed, "the trimming of production consumption became an essential factor for national income growth. Between 1977 and 1980 only 2.8 percent, M 800 million, came out of this source. In the years between 1981 and 1984, more than 40 percent in the national income growth came out of the reduction of specific production consumption. That was M 14.2 billion right there. The specific consumption of economically significant energy carriers, raw and working materials was cut back significantly. Between 1977 and 1980 it dropped by an annual average of 4.1 percent, between 1981 and 1984, by a 6.2 percent. All told, that saved in the last 4 years M 14.1 billion."[19]

This development for sure was much affected by the change in the trend of primary energy consumption, dropping by 1.6 percent between 1980 and 1983, even if it rose again in 1984. Linked with an increasing share of domestic lignite as part of the primary energy production, however, the rise in primary energy costs could be held down. This reflects manifestations essential to the growth-affecting role of resources saving. The less, e.g., the volume consumption of primary energy increases compared with the produced national income, the more economic growth is due to physical energy saving. But when primary energy consumption in physical units declines absolutely, not only economic growth is attained completely through the volumes in energy savings. For the simple reproduction of the net product also less primary energy is used than in the previous year. But since economic growth depends on the simple reproduction of the net product, an absolute resources saving gets from that its towering importance for comprehensive intensively expanded reproduction.

Because of the favorable development of the physical primary energy consumption since 1980, relative to 1979, until 1983 the primary energy intensity of the produced national income declined faster as a natural value magnitude at the annual average, at nearly 4.6 percent, than the produced national income rose at circa 4.5 percent--a tendency that reflects the transition to comprehensive intensification.[20]

Without such a saving, circa 60 million more tons of lignite would have had to be made available in 1983 compared with 1980. Considering the high and, in tendency, strongly increasing costs in social labor for expanding energy production, that would have required a considerable volume of labor, investments, basic assets, transport capacities, and outlays for environmental protection to make available and refine the lignite. Its exploration and extraction alone would have cost us some M 6 billion.[21]

This positive development is not altered even by the primary energy consumption increase of circa 2.7 percent from 1983 to 1984. Because of the high increase in produced national income of 5.5 percent, the energy intensity dropped by 2.7 percent. Consequently, roughly half of the national income growth in 1984 came out of energy saving. Also for the future development it turns out to be possible and necessary to realize 75 to 80 percent of economic growth without additional energy consumption, i.e. out of energy saving.

To get such growth proportions is a requirement of intensively expanded reproduction. Also in the USSR, as Mikhail Gorbachev has pointed out, "the increased economic demands for fuels, raw materials and materials are to be covered up to between 75 and 80 percent from savings" in the years ahead.[22] Reserves for it are found in reducing the conversion and transportation losses and the high specific material and energy use for many means of production and consumption by way of scientific-technological progress.

To parry the impact rising energy costs have on production consumption, the volume of energy consumption should have to drop circa by the same degree that energy costs rise. Yet the rapidly rising prices for energy raw materials on the world market since the early 1970's, the higher prices for equipment that produces and refines primary energy--rising to a somewhat smaller degree--and the specific labor efforts--rising because of poorer qualities and the increasing ratios between top layers and coal and between water and coal--for producing and refining domestic lignite could thus far not be compensated for. The ratio between the annual average growth rates of primary energy costs and primary energy consumption in the 1970-1983 period lies around 3.7:1.[23]

The ratio between the average annual growth rate of primary energy costs to produced national income and to production consumption in the early 1980's, at 12:3:1, indicates that the slower growth in production consumption in the outcome of deeper intensification, as compared with that of the produced national income, was achieved through a higher efficiency in other production elements. This tendency is likely to affect significantly also the future process of comprehensive intensification. For that reason, scientific-technological progress must be accelerated to an unprecedented degree either to render more favorable the influence of primary energy costs on production consumption through decisive improvements in primary energy use or to compensate or overcompensate for that influence through a higher efficiency in other production elements.

Scientific-Technologial Progress and Saving of Resources

A hastened economic utilization of the data of scientific-technological progress is increasingly becoming a basic requirement for improving the energy and materials economy. Scientific-technological progress is brought to realization here in appropriate working tools and their novel technological combinations, in the objects of labor, in that energy carriers and raw materials are exchanged with one another or a higher grade or less energy-intensive materials are utilized, as well as in energy-saving consumer goods consuming less material. At the same time, a broader capability is provided for reusing energy and material waste products from production and consumption as secondary energies and secondary raw materials.

Working tools substitute for labor objects in production. Reduced specific consumption of labor objects then can justify a dropping basic assets quota if that improves economic efficiency. At the same time, to operate these working tools, energy is needed and through the use of new energy-consuming technologies live labor is substituted. These tendencies on the whole lead to the use of energy carriers higher in use properties, the production of which also calls for a higher labor effort per energy unit. Then, even when energy is saved in natural units, energy costs may rise.

Rising proportions in the growth rates as of the produced national income and the consumption of enery, raw materials and materials express increasing efficiency of the primary energy and raw materials drawn into the economy cycle and are also regarded as a higher refinement criterion of theirs.[24] Generally speaking, refining is a process in which through the use of intricate live labor more and better use-value is produced from a given unit of raw material. It amounts to a sort of reversal if certain use-values, material, product, or utility structures have to be made available from qualitatively inferior raw materials and primary energy carriers. Here the enhanced refining of domestic raw lignite gains special importance for an energy and substantive use in lieu of oil products. Performing this substitution efficiently enough so that it can lead to resources saving and become an effective growth source makes demands on science and technology and becomes a crucial condition for ensuring the GDR's energy and raw material base.

A better energy and materials economy in one sector or process must, however also lead to higher efficiency in other sectors or processes. Thus there is the task at the economic utilization of scientific-technological progress in resources saving of simultaneously reducing the socially necessary labor effort for economic growth. Reducing the consumption of circulating funds in one sector that would lead to higher labor efforts in another, therefore does not count as saving.

In evaluating technologies and effects of saving one must therefore see to it, first of all, that reducing equal amounts of various use-values will produce diverse economic effects. As the effort needed to produce 1 joule of energy comes to a multiple of what is needed for the same amount of raw lignite, energy cost savings also differ from one another considerably.

Second, trimming the specific costs in utility energy ultimately saves primary energy resources. The magnitude of working hours saved, however, depends on which primary energy the saved utility energy was produced from. Thus, electrical energy and fuel production from raw lignite makes different demands than does petroleum on the magnitude and structure of the labor effort. Here one has to pay special attention to the cost dynamics due to the running costs for the production of the given utility energy. Thus, because of the high share of fuel costs in the total costs for electrical energy production on lignite base, changes in lignite costs affect the prime costs of electrical energy much more than is the case in producing it from nuclear fuels.

Third, primary energy is saved, both in volumes and values, when one manages to improve the conversion effects and to cut down the production losses. Right now, only a little more than six volume units of utility energy are produced out of ten volume units of primary energy, at the average, proportions produced being vastly diverse; for electrical energy production it is only circa 3.2, for fuel production on a petroleum base, it is more than twice as much. When there is more electrical energy in the production of utility energy, the ratio will worsen in case the heat produced is not used well in production and consumption. That attaches so much importance to reusing the waste of secondary energy or secondary raw materials. "At present, nearly 12 percent of industrial raw material requirements are covered by secondary raw materials."[25] The technical-economic usable secondary energy potential comes to circa 10 percent of the GDR's primary energy consumption.[26] That however is only a small portion of the waste in the form of heat, amounting to circa 80 percent of the GDR's primary energy consumption.[27] This high proportion of primary energy resources drawn into the economic cycle is lost today, and on the average that magnitude can represent the total raw material consumption. From this arises as an important task for science and technology a vast broadening of the potential usable as secondary energy and secondary raw materials. It means cutting back the consumption increase in primary energy and raw materials. Orienting science and technology more to working with secondary raw materials thus turns out to be an important requirement for comprehensive intensification and for improving the economy of social labor altogether.

Finally, and fourthly, substitution processes result in energy savings when the economically less favorable energy carriers are replaced by the economically more favorable ones, as was the case in substituting for heating oil by domestic lignite for energy use, made apparent by the prevailing ratio of specific costs at more than 5:1.[28]

The saving of energy, raw materials and materials in various processes makes diverse demands on the use of social labor in applying scientific-technical progress. So one has to pay attention to various levels of savings and their effect on the economic reproduction process.[29]

The first level is marked by energy, raw materials, and materials being saved by better standards and contingents and the elimination of waste including uses with less waste through technological improvements. This opens up potentials facilitating higher economic growth, without resorting much to investments, as compared with using extra resources. Thus far the largest savings have come from this level, which will keep reproducing its potentials at various magnitudes, so that it constitutes a permanent productive force through using the opportunities of the social division of labor, of the combines and of production organization.

The point at the second level is to use technologies known on the global scale that are having resources-saving effects. Putting them to effect requires time and investment and R&D expenditures.

As to the third level, there generally new resources-saving technologies and procedures, so-called key technologies, have to be developed and used. "That mainly includes microelectronics, modern computer technology developing on its basis, automated design and production preparation, flexible automated processing systems, new processing technologies, new working materials, and the whole biotechnology field. One must here also refer to creating cohesively closed substantive cycles in which the waste products that come off are to the largest extent being recycled."[30] This calls not only for an appropriate time lead, but also for higher efforts in social labor for R&D, investments and manpower.

All three levels are interacting and must always be pursued simultaneously. Along with the needed scientific-technological innovations of the third level, technological improvements continue to be of fundamental importance as elements of rationalization. The largest share of savings has come from them and will continue to come from them. Compared with that, the share of completely new procedures in resources saving has been relatively small in the period under consideration but sets the premises, as it were, for new large saving potentials for reproducing resources economizing on the large scale of production.

Through a new working principle or procedure, as one knows, such as microelectronics, biotechnology, or converter steel technology, also the economy of the objects of labor by way of the technological procedures substituted for is at once improved and the consumption of resources per value of product, radically reduced. Such "labor of exceptional productive force is exponential in effect."[31] Its economic effect exceeds the social average in manufacturing such a commodity or satisfying some definite demand. However, the possible advantage from it is realized fully only when the technology in question is used rapidly and massively and the average social production level is elevated all-around. Only through the massiveness of the technology and its constant rationalization, the inherent productive force provides comprehensive savings in working time. The less social labor is expended in its use, the more productive it is and "the more its service approximates that of the forces of nature."[32]

Once it has been set in motion, the resources-saving so achieved remains in effect, repeats itself as a service of scientific-technological progress free of charge. Savings grow further through constant technological improvements until that technology gets replaced by a new technological design. In the course of this process, this cycle, time and time again new production conditions arise with new levels of the social division of labor and new opportunities and requirements for trimming the running production consumption. To the extent that the saving potentials, accessible rather easily and through slight investments, are exhausted on the current production and reproduction scale, new resources-saving potentials have to be tapped on the subsequent scale. There is a "process of constantly reproducing the technology at increasing scales."[33] When scientific-technological innovations are not economically utilized in time, the tapping of possible saving potentials is delayed, the economy of social labor is diminished, and new growth-inhibiting factors may occur.

The cost/benefit ratio is much improved when the time factor is given attention and technological improvements rapidly contribute to the tapping of savings potentials. A one-time expense may, to be sure, be considerable. But it not only is returned fairly soon, it creates a pertinent benefit above and beyond it because the effect of this exceptional productive force is extended. Resources saved also, when used later, may produce higher economic effects. Lignite not used today for energy purposes can provide multiple benefits later, at enhanced refinement, for the energy and materials economy. From that are deduced not only the requirement, but also a great responsibility for spotting new working principles, procedures, and technologies and their being rapidly put into production. That actually is a prerequisite for ensuring resources-saving growth long term.

Normally basic innovations call for an extensive upgrading of the material-technical production conditions and for providing such technology with adequate new equipment. This process of substituting for energy, raw materials, and materials by labor assets may even justify a temporary drop in the basic assets quota if that is then being overcompensated by diminishing specific energy, raw materials and materials consumption.

By combining extant assets into new technologies which, through the use of rationalization means, is tantamount to an upgrading of the production base, processes are under way in which, step by step, a new type of technology, the resources-saving type, evolves. From the economic vantage point, technological modernization appears to be the only feasible way "for increasingly achieving effects of expanded reproduction by means of simple reproduction."[34] Then the slower growth in basic assets allocations for live labor, as compared with the labor productivity, must be linked with a less loss-incurring untilization of energy, raw materials, and materials and with reusing waste products as secondary energy and secondary raw materials, to hold the increase of such resources down.

Technological improvements today and for a long time to come are decisive for elevating the economy of embodied labor so that resources-saving growth becomes the crucial component. In no other way is the eocnomic strategy conceivable under the conditions of by no means unlimited resources and the higher costs for extracting and refining them. "Perfecting what we have only helps us gain the means for simultaneously creating new material prerequisites for the most up-to-date technological processes."[35] The more consistently that is done, the more we are opening up an accumulation source for developing new material-technical production conditions for enhanced raw material refining.

No country can afford today to orient itself solely to new working principles and procedures on the basis of new working tools in order to economize in resources. It would far exceed economic possibilities and preclude any short-term introduction of economic procedures. If between 1960 and 1984 the basic assets allocations for live labor in the GDR, at an average annual 5.5 percent, increased much faster than the produced national income, at 4.5 percent, and the labor productivity, at 4.4 percent, there was yet differentiation in the courses these processes took (cf. Table 4).

Table 4: Economic Cost and Efficiency Growth Entities in the GDR (in percent)

	1960-1980		1980-1984	
	Total Period	Annual Average	Total Period	Annual Average
Basic Assets, Producing Sector	297	5.6	123	5.4
Primary Energy Consumption (Volumes)	150	2.0	101	0.3
Basic Assets Allocation for Live Labor in the Producing Sector	298	5.6	121	4.8
Labor Productivity (Basis: Produced National Income)	242	4.5	116	3.9
Basic Assets Quota (Basis: Produced National Income)	82	-1.0	97	-0.9
Primary Energy Intensity (Basis: Produced National Income)[a]	61	-2.4	85	-4.0

---

a) At primary energy consumption at volumes

Source: Computed from "Statistisches Taschenbuch der DDR 1985," op. cit., pp 25, 32, 35, 57.

Between 1960 and 1980, the ratio between the average annual growth rates from increased labor productivity and the increase in the basic assets allocations for labor was 0.80:1. In the early 1980's it scarcely improved, labor productivity increasing more slowly. While the basic assets quota also only improved slightly, and still shows a declining trend, a new magnitude was reached in the decline of primary energy intensity. It underscored the need to bring about a resources-saving principally through better basic assets utilization.

That is made apparent by processes such as a comprehensive application of the heat-power coupling, which makes possible more than doubling the effective degree of primary energy conversion in electrical energy production. "With the volume of coal used being identical, along with electrical energy production, more secondary energy becomes available to satisfy the heat requirements."[36] Such an increase in the effective energy degree, to be sure, depends on preconditions that are not only technical or economic. For instance, customers must be found or created close to the place where the heat is generated since, on technical and economic grounds, transportation distances are limited for heat energy. To be sure, the one-time cost for heat-power coupling comes roughly to what it would cost to set up a comparable heating plant based on lignite. However, while for such a heating plant lignite would constantly be needed, the heat-power coupling uses heat that would otherwise evaporate as waste product into the environment. The heat becomes available free of charge, virtually. This is a productive force man absorbs gratis, without extra work, a productive force given by nature.[37]

The use of this productive force and its effectiveness come out of the "social combination of labor,"[38] the special improvement of extant machinery.[39] The full utilization of the advantage in this productive force, to be sure, calls for a level of socialization which creates, along with the technological possibilities in the production process itself, also the necessary prerequisites through an appropriate distribution of the productive forces and sets up consumer centers close to already existing heat producers. At the same time--and this holds true especially for setting up a nuclear energy base--new heat and electrical energy production capacities have to be established where consumer centers already exist or are meant to be set up in the wake of the territorial distribution of the productive forces and the development of new production structures.

Though the use of known technologies provides a large source of resources-saving, it cannot be a matter of merely copying the familiar. Strengthening economic efficiency largely depends on which top technologies in resources-saving are made available. This precisely controls a more efficient utilization and more enhanced refining of domestic raw materials and the sale of relevant technologies, by which over the long haul economic advantages--a surplus value--also becomes possible on the foreign market.

For that, the time horizon is most essential. Today for instance one is quite certain for a fairly long time about the effect of social productive forces on the expansion and diversification of energy production--such as using nuclear energy or lignite refining--with possible projections for over 30 to 50 years. For energy economizing this is by no means so to the same extent. Yet there too the time horizon for including new productive forces in the economic cycle has to be broadened. This is a basis for estimating their technical utilization and their effects on energy and material requirements and for predicting their economic efficacy on the economic scale and, especially, the requirements made on social labor and its distribution.

Watching these tendencies and estimating their effects on productivity and resources-saving is as important as perfecting the procedure itself. In finding new solutions for a better economic utilization of the circulating funds, in a fast and massive effectiveness of these results in all phases of the social reproduction process, and in reusing saved resources and their conversion into social progress, new forms of socialization are occurring in the process of comprehensive intensification. That calls for working on these problems in a complex fashion and through interdisciplinary research.[40]

On the Social Labor Effort for Saving and Expansion

It can be assumed that the saving of a unit of energy, raw material and material over the long run calls for less specific effort in social labor than producing extra units of them. Analyses have shown that the effort in saving a physical unit of energy is only circa 30 to 50 percent of what it takes to make extra units available. Hedrich and Riesner have shown that the average social effort in energy saving, depending on the process, comes to between 2 and 50 percent of the use of fossile energy carriers via conventional conversion.[41] Though expansion as well as economizing costs are likely to rise in the future, these average values are not likely to change much. Even if in some processes the economizing costs will temporarily increase faster than the cost for additional production. If the environmental stress reducing effect of saving, still neglected in part today, is included in the evaluation, the saving effort may come to still less. The production effort could rate as the boundary effort for saving.

This cost trend calls for an accurate analysis, to be sure. For one thing, because of general changes, in the material-technical production conditions of the energy and raw materials base, in the primary and utility energy structure, and in the raw materials and materials structure the tendencies in the economizing and expansion efforts are going to change. And then also, the effort evaluation must account for not only the one-time effort in social labor, but also for the running expenses, not only for the direct, but also for the indirect outlays.

If one compares the one-time outlays for saving with that for expansion, one may get a very incomplete picture in favor of economizing measures. Running expenses must also be evaluated that are generated within a given period relative to the reproduction costs. When heat is produced from lignite, e.g., the fuel costs are the most dynamic magnitude. It reflects the increasing fuel costs and shows up, during the expansion measure, when an extra heating capacity is established, always at a considerable altitude and with a mounting tendency. When, on the other hand, the heat-power coupling is used as an economizing measure, that influence declines.

To understand the order of economic magnitude, in paying attention to the interlinking relationships, the socially necessary labor effort in the processes prior and subsequent to economizing and expansion--the indirect expenditures--have to be included in the assessment. Only from comparing the total expenses, which are nearly quite as high as the direct ones, one can detect the tie-up of social labor for need satisfaction to circulating funds and their needed distribution over the branches and sectors. Because of this high share of social labor--energy and raw material investments reach magnitudes of circa two-thirds of all industrial investments--it is at the same time a most decisive magnitude for production structure development.

While even determining the expansion and production efforts including all these components is not all that uncomplicated, the economizing effort raises many new problems. The use-values produced become real only when they are being applied for the sake of improved demand satisfaction. This includes such use-value properties as a reduced input/output ratio, easy maintenance, or regeneration and modernization capacities, the effects of which reflect the energy and materials economy. The saving of energy, raw materials and material becomes an important component of efficiency, to be sure, but cannot easily be attributed to a particular process or product.

Reducing the specific expenses in circulating funds may result in economic losses when it results in excessive labor efforts in the utilization of the use-values. For the sake of improved demand satisfaction not even the instance is precluded of raising the labor effort in production if over the whole working life of the commodities incomparably higher savings are attained. Input/output can thus be judged only by evaluating both the costs and the benefits the users derive. The saving of heat energy, e.g., through more highly insulated panels or new and more expensive insulation materials may even involve higher construction costs. If one then were to pit the heating costs saved against the one-time expenses for such insultation materials, one would undoubtedly come to reject such better insulation. The economic efficiency of the economizing measure to be taken today will become visible only over a period of perhaps 50 years by accounting for the running surplus costs for wages and heat and the final magnitude of future reproduction costs.

To deduce from this complicated matter, however, that the saving effort cannot even approximately be predetermined, would place in doubt all given posibilities for planned and proportionate economic development. What rather is necessary is to perfect our sets of instruments constantly. The "precise assessments of expenditures is of great weight because that prepares the field of decision-making for economic planning."[42] That makes possible a more accurate formulation of scientific-technical requirements, long-term redistribution of social labor, and the introduction of structural changes that come with it. Hence, investments for saving in their material-substantive structure differ decidedly from those for expanding the production of energy, raw materials and material. It simply is not immaterial whether investments are to be allocated for expanding the lignite production and its liquefaction into fuels or for producing a combustion engine that now only uses merely 5 instead of 9 liters per 100 km, which considerably reduces fuel requirements. Disparate requirements emanate for production structure development from using investments for open-pit mining equipment and chemical plants or, predominantly, for products of machine tool construction.

Securing a stable economic growth over the long run cannot come from economizing alone, of course. Economizing and the expansion of the energy, raw materials and materials production continue to exist in unity as they always did. That is actually a basic condition for intensively expanded reproduction. And here one has to distinguish between enlarging the necessary production of these resources and the expanding of the material-technical conditions for that production.

Economically, there arises the problem in making energy available that even the plain reproduction of the physical replacement fund in energy leads to rising costs in social labor; for one thing, because of the declining natural terms in primary energy production and the price hikes on the world market; but then also because even when the energy consumption, at physical volumes, does not increase or increases only slightly, pit mining has to be opened and lignite refining plants and nuclear power plants and heating plants have to be built. The material-technical conditions for energy production have to be expanded, and old open-pit mines and installations have to be replaced by new ones .

Similar in part also are the problems in making other raw materials and materials available, as in the conversion to converter steel or plasma technology in metallurgy, in the industrial application of biotechnologies in agriculture, in raw material extraction and other industrial sectors.

The unity between intensive and extensive development in the energy and raw materials base underscores the great economic importance of economizing. One thing is obvious: If through economizing the increase of the physical replacement fund for energy, raw materials, and materials is held back, it relieves the economic investment and accumulation capacity, and the absolutely necessary assignment of social labor for expanding the energy and raw materials base and for substitution measures can be distributed over a longer period. An important science and technology task is to make an important contribution to resources-saving growth through the economic utilization of scientific-technical progress and new energy and material-saving technologies, means of production, and technical consumer goods. For that one has to find the kind of effects of the scientific-technological revolution that ensure the best growth conditions. Interdisciplinary efforts are offered a broad field for evaluating the technical, economic, and social effects.

PRODUCER GOODS ALLOCATION GUIDELINES FOR 1986-1990

Warsaw RZECZPOSPOLITA (REFORM GOSPODARCZA Supplement) in Polish No 65, 19 Dec 85 p 1

[Article by Dr Andrzej Zawalski, head of systems analysis and design department, Ministry of Materials and Fuel Management: "How is Access to be Gained to Materials?"]

[Text] In its Resolution No 124/85, the Council of Ministers set forth the general principles governing operation of the materials and equipment supply system over the 1986-1990 period, simultaneously authorizing the Minister of Materials Management to regulate certain detailed questions.

In accordance with this authorization, Directives have been issued regarding the principles applicable to the process of materials and equipment supply over the 1986-1990 period, together with a supplement (in the form of Circular No 15) deriving from Council of Ministers resolution No 178/85 on the National Annual Plan for 1986. The texts of these documents are discussed below.

Especially noteworthy are the following regulatory provisions contained in the documents in question.

1. The socioeconomic goals which will be given preference in the procurement process are defined in detail.

Such preference consists of imposing on suppliers of regulated materials the legal obligation of concluding contracts with customers carrying out assignents of this nature and granting these customers priority over other purchasers in procurement of free-trade materials.

Such priority will be given to enterprises engaged among other things in execution of operational programs, performance of assignments in the area of national defense and security (this also including production and services connected with firefighting), and production for export of processed goods a list of which is drawn up by the Minister of Foreign Trade.

Small-scale manufacturing units receive preference over a relatively wide range. They are units which statutorily employ handicapped workers, units performing essential services (ophthalmic, laundry, clothing, tailoring, reupholstering, and blacksmith-locksmith services), and units manufacturing folk art and craft objects.

2. The Directives specify the procedure for procurement of regulated materials, and also clearly define the scope of responsibility of mandatory agents toward customers. This applies in particular to the responsibility of responding within a period of 14 days to short-term orders placed by customers, the obligation of stating a delivery date with an accuracy at least of 1 month, and the obligation of acceptance of orders from customers by agents within a period no longer than 45 days in advance of the delivery date.

The purpose of these provisions is to institute greater discipline in the process of procuring regulated materials and to counteract the not infrequent cases of absence of any response by a broker to a customer's order and of giving information that might mislead a customer. Improvement in this area can have a favorable effect on the process of planning stock procurement and management in enterprises.

3. A new element in procurement principles for the 1986-1990 period deserving special mention is assignment of a higher ranking to long-term (multiannual) contracts. For this purpose, Council of Ministers resolution No 124/85 provides the possibility of collection by suppliers of surcharges added to the official prices of materials, provided that deliveries of such articles are made on the basis of a long-term contract. The ceiling of this surcharge is determined by the Minister of Finance. The Directives also provide that if such a contract is concluded for delivery of regulated materials, the volume of such articles covered by the contract will be exempt from the regulation procedure.

For obvious reasons, units performing the function of mandatory agents must participate in the conclusion of long-term contracts for supply of regulated materials, and any disputes will be resolved by the supervisory groups established.

Long-term contracts must be concluded above all between customers consuming large quantities of materials who regularly purchase the materials from the same suppliers. For one thing, this would permit partial stabilization of the contractual relationships between constant partners, and would also aid in acquiring exemption from regulation.

4. A significant measure instituted by the Directives is introduction of a special mode of coordinating trade in certain regulated materials employed in housing construction. The principle adopted for 20 such items is that the amounts delivered will be established within the volume distributed to the individual provinces, in keeping with the level of multiple-family housing construction in progress and with the level of repairs to residential structures.

This measure also ensures suitable coordination of the volume and direction of material deliveries with the geographic distribution of housing construction over the country. The experience acquired over the 1984-1985 period has confirmed that the measure is an effective one.

5. An important matter that has given rise to numerous disputes among enterprise supply offices is the so-called preemption principle applied in trade in regulated materials.

Council of Ministers Resolution No 124/85 clearly restricts the range of application of this right. On and after 1 January 1986, regulated materials may be resold without restriction by an owner who is a socialist economic unit, with the exception of customers purchasing such materials in connection with accomplishment of priority tasks given preference in procurement and submitting an appropriate order certificate relating to this circumstance, and also except for precious and nonferrous metals and liquid fuels to the resale of which the preemption granted to corresponding sales organizations must by no means be observed.

The preemption is in effect for a period of 14 days only, during which the sales organization must respond to an offer made by the owner of a stock of materials either by purchasing the lot offered or by indicating another purchaser.

Council of Ministers Resolution No 124/85 provides the possibility of widening, in justified cases, the range of application of the preemption principle in trade in regulated materials. Decisions are made in this matter by the Minister of Materials and Fuel Management, with the concurrence of the chairman of the Planning Commission under the Council of Ministers.

6. The Directives set forth detailed principles governing trade in liquid fuels. Because of the ongoing shortage of such fuels, restrictions have been maintained on purchase of 3 types of these fuels, that is, gasoline for internal combustion engines, diesel oil, and heating oil. Special restrictions apply to trade in and management of these fuels for the same reason. If a control authority discovers irregularity in this area, the limits that have been set may be correspondingly lowered, to as low as 15 percent if improper management is detected a second time.

7. Wholesale enterprises perform an important function in the materials procurement process. Because of the widespread wholesale network, they represent a closer and more convenient source of supply, especially for customers who consume less than the full amount of specific materials by weight in a given quarter. The minimum batch purchased wholesale can be fairly small and can include different assortments, unlike the supply offered by manufacturers, who justifiably propose sale on a single occasion of large batches of a single assortment.

In the Directives in question, mandatory agents have been assigned the obligation of securing a suitably large volume of goods for the wholesale trade. The currently frequent instances of shortage of materials at wholesale apply pressure on customers to place orders with manufacturers, even when the latter do not represent a rational source of procurement for them. This in effect leads to accumulation of overly large stocks of materials by customers, recycling of these stocks, and the establishment of intermediate rail links serving a small group of customers (such as supply plants or offices within the framework of associations and supply enterprises).

To improve the situation in this area, the units acting as mandatory agents have been assigned the obligation of concluding or verifying cooperation agreements with the wholesale enterprises listed in the annex to the Directives. Such agreements must contain all the essential provisions needed for suitable development of wholesale trade in materials over the 1986-1990 period. This is extremely important for making the procurement process more flexible, as well as for modifying the unfavorable distribution structure of stocks of materials by increasing such stocks in the area of trade.

The principles set forth in Council of Ministers Resolution No 124/85 and in the Directives of the Minister of Materials and Fuel Management constitute a set of legal standards regulating procedures in the area of trade in regulated materials. The practical operation of these regulations will depend largely on the behavior and attitude of individual partners in the marketplace. This requires among other things that these partners be efficient and consistent in applying the authorizations to which they are entitled. Purchasers of materials must follow the established appeal procedure in the event of improper action on the part of suppliers. The economic arbitration system must be resorted to more frequently. Purchasers carrying out priority assignments in particular must avail themselves of the protection afforded by this system. Such purchasers, although presenting justified needs connected with the performance of these assignments, encounter refusal on the part of suppliers to conclude contracts on the terms desired. Experience has proved that this form of customer protection has not yet been properly utilized.

The efficiency of operation of the materials supply system, as regards both regulated items and articles not covered by the regulations, depends to a significant extent on the generally prevailing legal solutions governing contractual relationships in commodity turnover. An essential role is played here by the regulations applicable to the process of concluding purchase contracts between socialist economic units, and by the regulations introducing financial penalties for failure to adhere to the prevailing principles of trade in regulated materials.

As regards the regulations applicable to the principles governing conclusion of contracts, Council of Ministers Resolution No 207/83 has been updated to create more favorable conditions for protecting the position of the purchaser in the marketplace.

Financial penalties for violating the regulations governing the process of trade in regulated materials over the 1986-1990 period will be instituted in an order of the Council of Ministers. The basis and range of the financial penalties are expected to be essentially similar to those currently in effect.

When these legal instruments have been enacted, they will, of course, be published in REFORMA GOSPODARCZA.

FOREIGN DEBT SERVICING FUND ESTABLISHED

Warsaw RZECZPOSPOLITA (REFORM GOSPODARCZA Supplement) in Polish No 65, 19 Dec 85 p 1

[Legislation: "The Foreign Debt Servicing Fund: Law of 23 December 1985"]

[Text] Article 1.1. The Foreign Debt Servicing Fund, hereinafter referred to as "the Fund," is hereby established.

1.2. The fundamental aim of the Fund is to create financial conditions for servicing the foreign debt.

1.3. Whenever reference is made in this law to socialist economic units, such units shall be understood to mean units as defined in Article 1, Paragraph 1, of the law of 26 February 1982 on taxation of socialist economic units (DZIENNIK USTAW [Official Gazette], 1984, No 16, Item 75, and 1985, No 12, Item 60 and No 37, Item 174).

Article 2.1. The revenue of the Fund is made up of the following.

(1) payments by socialist economic units in the amount of 2 percent of the net value of fixed capital, as determined on the basis of the status at the end of the previous year, made from the development funds or other funds intended for financing the development of such units.

(2) payments by socialist economic units deriving from the portion of the excess value of stocks determined in connection with changes in official prices.

(3) revenue from government foreign loans.

(4) supplementary grants from the national budget.

(5) other receipts as provided in separate implementing regulations.

2.2. The Council of Ministers will issue an order specifying the amount of the payments, extending over a period of 2 or more years, provided in Article 2.1(1). In this order the Council of Ministers may, in particularly justified cases, specify exemptions from and reduction of payments to the Fund.

Article 3. The resources of the Fund are intended to supplement the existing sources for financing repayment of instalments representing principal plus interest of foreign debts and to service state credit granted abroad.

Article 4.1. The Fund will be administered on the basis of annual plans approved by the Sejm (Parliament).

4.2. The draft annual plans for the Fund will be submitted to the Sejm by the Council of Ministers along with the draft balance of payments plan of the government.

4.3. The Council of Ministers will each year determine the amount of the portion of excess value of stocks subject to payment into the Fund.

4.4. The Council of Ministers will each year submit to the Sejm a report on administration of the resources of the Fund, together with a report on implementation of the balance of payments plan of the government.

4.5. Draft plans for the Fund and reports on the administration of its resources will be submitted to the Council of Ministers each year by the Minister of Finance.

Article 5.1. The resources of the Fund will be administered by the Minister of Finance, in accordance with the plans specified in Article 2.1.

5.2. The Minister of Finance will determine the procedure and deadlines for making the payments specified in Article 2.1(1) and 2.1(2).

Article 6.1. The regulations governing liability to taxation will be applied to the payments specified in Article 2.1(1) and 2.1(2).

6.2. The Minister of Finance will have authority to settle questions relating to obligations deriving from assessments in favor of the Fund.

6.3. Correctness of computation and timeliness of payments by socialist economic units based on assessments in favor of the Fund will be monitored by the revenue offices having jurisdiction in the area of the main offices of the units obligated to make payments into the Fund. In the event of incorrect computation or delay in remittance of payments, they will be authorized to establish obligations plus late payment interest and to collect the amounts due by administrative process.

Article 7. Resources of the Fund which are not utilized within a given calendar year will be carried forward to the following year.

Article 8. The provisions of the budgetary law relating to the administration of special-purpose funds will be correspondingly applied to questions not regulated by this law.

Article 9. Article 16.2 will be deleted from the law of 3 December 1984 (budgetary law, DZIENNIK USTAW No 56, Item 283).

Article 10. This law will enter into effect on 1 January 1986.

GOODS, SERVICES SUBJECT TO OFFICIAL PRICING

Warsaw RZECZPOSPOLITA (REFORM GOSPODARCZA Supplement) in Polish No 65, 19 Dec 85 p 1

[Parliamentary resolution: "Official Prices of Goods and Services. Resolution of the Sejm of the Polish People's Republic of 23 December 1985 Listing Goods and Services for Which Official Prices are Set"]

[Text] The following resolution is hereby adopted on the basis of Article 7.1 of the law of 26 February 1982 on prices (DZIENNIK USTAW [Official Gazette], 1985, No 49, Item 261).

Section 1.1. Official prices will be set for the following.

(a) Consumer goods and services of fundamental importance in establishing the costs of subsistence or preservation of human health.

(b) Bread, rye and wheat flour, macaroni, barley cereal and semolina cereal, rice, and oat and barley cakes.

(b) Pork, beef, and veal, products of such meats, with the exception of delicatessen meat products, ground meat, and chicken covered by the central distribution system, as well as giblets in regulated marketing.

(c) Bacon, lard, butter, and vegetable fat.

(d) Milk for human consumption; sour cream and sweet cream with a fat content of 9 percent and 12 percent respectively.

(e) Domestically produced powdered milk and nutritious milk mixtures.

(f) Cheese, with the exception of cheese from ewe's milk and combined ewe's and cow's milk.

(g) "Bobo-Vita" canned goods, "Bobo-Fruit" food items and fruit and vegetable preparations for children less than 3 years old and produced by a special technology.

(h) Sugar.

(i) Domestically packaged varieties of tea (Popularna, Gruzinska, and Assam).

(j) Coal and coal briquettes, coke, semi-coke, heating of residences with thermal energy, and delivery of hot water to residences.

(k) Piped and non-piped gas and electric energy for household use.

(l) School and academic textbooks and 16-sheet and 32-sheet notebooks.

(m) Manufactured drugs, serums, and vaccines and bandaging products contained in lists drawn up by the Minister of Health and Social Welfare.

(n) Transportation of passengers and freight in urban mass transit vehicles.

(o) Services rendered by socialist social welfare establishments, infant care homes, kindergartens, day care centers, and guardianship and educational establishments, and by hostel services provided by school youth shelters.

(p) Admittance tickets to moving picture theaters, museums and theaters, operas and operettas, philharmonic orchestra and other artistic institutions, except admittance tickets to stage, cabaret, and circus performances.

(q) Services rendered by social health service establishments (hospitals, sanitation and epidemiological stations, etc).

(r) Personal services performed by individuals for social public health establishments (giving blood, etc).

(s) Transportation of passengers in coastal navigation.

(2) Means of production and services of critical importance in determining capital replacement costs.

(a) Coal and briquettes of coal, as well as coke and semi-coke.

(b) Petroleum and fuel oil.

(c) Piped and non-piped gas.

(d) Electric energy.

(e) Sawn wood and general-purpose timber.

(f) Cotton.

(g) Basic chemical fibers (viscose, polyamide and polyester, uncarded textile and industrial rayon, carpet rayon, staple and drawn viscose, polyamide, and polyester fibers of the cotton and wool types, carpet fibers, and staple and drawn acrylic and polypropylene fibers).

(h) Rubber and latex.

(i) New domestically manufactured tires for trucks, buses, and trolleybuses and for agricultural machines, equipment, and tractors.

(j) Buses, trolleybuses, streetcars, trucks, and road tractors with a carrying capacity exceeding 1.5 ton.

(k) General-purpose wheeled farm tractors manufactured by the Ursus Tractor Industry Association.

(l) Apatites and phosphorites.

(m) Ores and scrap metal (purchase and selling prices).

(n) Iron and steel metallurgy products, with the exception of forgings, wheels, tire rims, forged and rolled rings, and railroad turnouts and accessories.

(o) Metallurgical products of non-ferrous metals and products resulting from processing of non-ferrous metals.

(p) Cables and conductors.

(q) Sulfur and sulfuric acid.

(r) Cement.

(s) Cellulose.

(t) Rye and wheat flour, barley and semolina cereal; pork, beef, and veal in the central distribution system; bacon, fat, and lard; vegetable oil and fats used exclusively for culinary purposes; milk for consumption; sour cream and sweet cream with a fat content of 9 percent and 12 percent respectively; cheese, with the exception of cheese from ewe's milk and from ewe's milk and cow's milk combined; sugar.

(u) Artificial fertilizer, with the exception of horticultural fertilizer and agricultural limestone.

(v) Medium-protein feed mixtures for cattle, hogs, and slaughtered poultry procured under contract; high-protein feed concentrates and mineral feed mixtures for cattle and hogs; milk-substitute feed mixtures; defatted feed milk; powdered buttermilk and whey; feed casein and grain, including corn, grain pellets, bran, and extraction pellets.

(w) The basic plant protection agents contained in the list drawn up by the Minister of Agriculture, Forestry, and Food Economy, with the concurrence of the Minister of Finance, with the exception of ready-made imported products.

(x) Services performed by medical equipment repair shops and medical equipment shops subordinate to people's councils or supervised by the Minister of Health and Social Welfare.

(3) The purchase and selling prices of the following basic agricultural products that are imported or procured by socialist economic units.

(a) Grain, with the exception of millet and grain planting stock.

(b) Cattle, hogs, and calves for slaughter, as well as chickens purchased under contract, raised on the basis of a full-portion feed mixture out of government stocks.

(c) Pigs and young boars sold in government intervention procurement.

(d) Cow's milk.

(e) Sugar beets.

(f) Potatoes, with the exception of early potatoes and seed potatoes, over the period from January to May and September to December.

(g) Rapes and turnips, with the exception of planting stock.

(h) Sheep's wool.

(i) Rawhides (cowhide, calfskin, and pigskin).

(j) Leaf tobacco.

2. Official prices will also be established for the following.

(1) Raw ethyl alcohol, rectified spirit (ethyl alcohol) (ordinary, select, and luxury grades), with the exception of desulfitized, post-rectification, and dehydrated alcohol and alcohol products, with the exception of those purchased from citizens.

(2) Tobacco products, with the exception of those purchased from citizens.

(3) Domestically manufactured matches.

(4) Gasoline and fuel oil.

(5) Gold and other precious metals, as well as precious metal scrap.

(6) The funeral services contained in the list drawn up by the Minister of Construction, Area Development, and Municipal Administration.

(7) Admission to municipal parks, zoological gardens, recreational centers, seaside resorts, and municipal baths and public lavatories.

(8) Refuse removal by public service enterprises.

(9) Mandatory testing and inspection of objects on the basis of separate regulations (performance of technical inspections, technical testing of vehicles, testing of imported and exported goods, and measurements and tests performed by the State Radio Inspection Authority).

(10) State reserve warehousing services.

(11) Maps and other geodetic and cartographic materials sold from the state geodetic and cartographic inventory.

Section 2. The following payments (fees and charges) will be regarded as official prices.

(1) Those for domestic transportation of passengers and baggage by rail and in public airplane traffic (on regularly scheduled flights), with the exception of prices for pullman berths and in sleeping cars and for domestic transportation of freight by public motor vehicle and in water transport set on the basis of the conveyance law of 15 November 1984.

(2) Those for postal and telecommunications services in domestic traffic set on the basis of the communications law of 15 November 1984.

Section 3. This resolution will enter into effect on 1 January 1986, and will remain in effect through 31 December 1986.

PLANNING OFFICIAL ON PERFORMANCE OF ECONOMY

LD170506 Warsaw Domestic Service in Polish 1105 GMT 16 Feb 86

[Interview with Dr Janusz Biernat of the Planning Commission of the Council of Ministers, conducted by unidentified moderator--date not specified; live or recorded]

[Text] [Moderator] We have in the studio Dr Janusz Biernat of the Planning Commission at the Council of Ministers. Doctor, here we are in February, and to tell the truth, after the experiences of last year's winter, which caused us so many economic problems that in some spheres, the losses incurred were not made up by the end of the year, I think that it would be a good thing to consider how it will be with this year's winter.

[Biernat] I think that for the moment there is no cause for greater alarm, because as far as January is concerned, for all intents and purposes it was not exceptionally cold. Industrial production was nearly 5 percent higher than in January of last year.

[Moderator] It was not bad in January of last year either; it was only in February that [words indistinct].

[Biernat] Yes, that is so. It only began to get bad, and the biggest drop in production only occurred in February 1985. Of course, it is difficult to judge what this February will be like, because we don't have the statistics yet. As far as the results for January are concerned, they are not bad: regarding building and assembly production for January 1986, it is nearly 9 percent higher than that of January 1985; in haulage, again, there is no drop in January 1986. I also think that the effects of winter on the functioning and results of the economy must be examined from two angles: to what extent are such great drops in temperature alone used to explain the absence of progress in efficient economic management, low work productivity, and so forth; and to what extent is this effect [of winter] really relevant? I think that this effect was relevant last year in those first 2 months, because the elements of production, mainly those such as the power media, were directed to other purposes--not to production, but to the supply of the municipal sphere, to the communal economy, the sphere of [word indistinct].

[Moderator] Like heating.

[Biernat] Quite simply, heating, and this was the main, fundamental influence. However, we must also take into consideration the fact that while the harsh winters had a positive effect on foreign trade in coal, which means that coal export prices rose, we cannot count on this now, because oil prices are relatively low and are continuing to fall.

[Moderator] They are half of their highest level.

[Biernat] Yes, of their highest level, somewhat around 16 or even less per barrel.

[Moderator] Yet it had been as much as $35.

[Biernato] That's right. Therefore, we not have to take into account the fact that we won't be able to counter the effects of the harsh winter with better results in coal export. The main issue is above all that of our structure. After all, the negative effects of the previous winter showed themselves, among other things, simply in the fact that coal export was lower in the first 2 months of 1985, which....

[Moderator interrupts] This is not because no one wanted to buy, but because we couldn't sent it out.

[Biernat] Because we couldn't send it out, because, above all, it had to go the communal sphere, to supply the town and countryside.

[Moderator] I attended several discussions concerning the party's draft program, and most discussion, relatively speaking, arose over economic matters outlined in this program. Of course, there are certain aims here, and it is difficult to talk about the details when one is analyzing the prospects for a dozen or so years, three 5-year periods at least and maybe more. However, certain doubts and anxieties were expressed that the slogan of an apartment for every family by the year 2000 occurs here; yet we know, after all, that it is a struggle at this moment, that one waits for 18 or even more years, and so, well into the year 2000. We know that every year the population increased by 340,000 to 350,000 Poles. I assume that they will marry, and as a result, 175,000 apartments will be needed for them. And we manage to build this many apartments every year with difficulty. To what extent are these optimistic points in the draft program realistic?

[Biernat] I think that the reply must be as follows. Just as on page 17 of the party draft program; I am thinking of page 17 of TRYBUNA LUDU. It contains a formula which says simply that we are banking on an objective presentation of the economic situation and all the problems of economic growth, and I think the reply must be that the scope for fulfillment of public aims, those concerning the program of housing construction, hospitals, education and upbringing, protection of health; all this will depend, above all, on how far we are able to improve economic management efficiency. This means simply that the fulfillment of all these social programs, over and above the level which we are now implementing, will depend precisely on the extent to which we are able to increase production but with the same supply of the elements of production. What is the....

[Moderator interrupts] Raw materials, energy, and so forth.

[Biernat] Raw materials, energy, fuel and so forth. How did 1985 look? Well, it must be said that we didn't show any particular evidence of an increase in economic management efficiency. It is worth only....

[Moderator interrupts] Yet we talked a great deal about the fact that we ought to.

[Biernat] Yes, we ought to. It is true that we talked a great deal. Well, as an example, regarding realistic remuneration in the material production sphere, in practice it has goen up by 3 percent. This is, more or less as much as in industrial production, but we have not manifested a significant improvement in economic management efficiency. On the contrary, in some matters it is below the assumptions of the plan. Let us take export to countries of the second payment zone as an example. It is lower than last year in absolute terms, if converting to hard currency; but regarding export to, for example, countries of the first payment zone, the negative balance was significantly higher than we planned, and it is well know that dependent upon this export are, in turn, supplies, import supplies, and so on.

[Moderator] And the condition for exports is quality, once again, for the 4th year, we have a decreasing trend in, for example, exports of products of the ectronic machines industry to the second zone; it is clear that the structure of exports is such that we are not able to increase exports as quickly as we should with fuels, raw materials and various other goods. Therefore, it can be said that the point which concerns the scope of fulfillment of social programs in the party's draft program is dependent upon whether we are able to manage our affairs in a significantly more efficient way, and simply to economize more from those resources and materials at our disposal.

[Moderator] But you mentioned the unfavorable foreign trade balance. This also constitutes our debt, but to tell the truth, I didn't notice a proposal for solving this matter in the draft program.

[Biernat] Well, there is, of course, no other way of solving this than....

[Moderator interrupts] Than to pay up, of course.

[Biernat] Than through the increase of exports because paying up is an effect of the extent to which we are able to increase exports. That is the essential thing, therefore, of shifting the economy to a pro-export footing, which we are working on and talking about a lot. But to create any significant effects we simply have to work on it a bit more.

BRIEFS

REFORM ASSESSED IN RADOM--A meeting was held in Radom on 25 February attended by enterprise managers, secretaries of PZPR plant committees, representatives of workers' self-management councils and of union aktivs in this voivod. Problems associated with the economic reform were discussed and its functioning in the Radom area was assessed. Participants in the meeting included: Zofia Grzyb, Politburo member, and Wladyslaw Baka, president of the National Bank of Poland and vice chairman of the Sejm Commission for Economic Reform. [Text] [Warsaw TRYBUNA LUDU in Polish 26 Feb 86 p 2] /12232

PASSENGER TRANSIT TO HUNGARY--Talks between Janusz Kaminski, minister of transport, and Lojos Urban, the Hungarian minister of transport, focused on the urgent need for improvement in passenger transit between Poland and Hungary, including shortening the length of time for train travel and raising the level of services. During the meeting in Warsaw, the heads of the two ministries also discussed other problems concerning current cooperation between Poland and Hungary in the area of rail, automobile and plane transport and established directions of its future development. [Text] [Warsaw TRYBUNA LUDU in Polish 26 Feb 86 p 2] /12232

COOPERATION WITH KUWAIT--About 6,000 Polish specialists are working in Kuwait, including doctors, engineers, geodesists and businessmen. Cooperation between the Foreign Trade Enterprise "Polservice" and many companies in that country results in the fact that Poles living there with group or individual contracts work in various walks of life. The 10 societies comprising the Society of Polish-Arabic Friendship will soon be joined by an 11th, which will bring Kuwait closer to Poles. An entrepreneurial group, headed by Abdul Mohammed al-Harni, a businessman who has been involved in trade with Poland for over 20 years, has also been established in this country. On 25 February, the national holiday of this country, namely, its 25th anniversary of independence, he discussed the prospects of economic cooperation with representatives of the Ministry of Foreign Affairs and enterprises cooperating with Kuwait. [Excerpts] [Warsaw TRYBUNA LUDU in Polish 26 Feb 86 p 2] /12232

TRADE TALKS WITH HOLLAND--An assessment of the present state of trade and economic cooperation between Poland and Holland and the potential for its further development was the subject of talks held on 24 February between A. Wojcik, minister of foreign trade, and H.A.L. Vijverberg, the Dutch ambassador. [Text] [Warsaw RZECZPOSPOLITA in Polish 25 Feb 86 p 2] /12232

STEELWORKERS NEED TO INCREASE QUALITY--The current situation in the steel industry, and problems related to steelworkers' social and working conditions were discussed today at a meeting between Deputy Premier Manfred Gorywoda and representatives of the Ferrum steelworks work force in Katowice. The deputy premier stressed that it is necessary, in accordance with government provisions up to year 2000, to increase the quality of steel products, primarily those of stainless steel. [Text] [Warsaw Domestic Service in Polish 1900 GMT 7 Mar 86 LD] /6662

SOVIET BORDER TRADE--Nearly 2 million tons of Soviet raw materials and goods were received over the period of 2 months this year by the workforces of frontier stations Zurawica-Przemysl-Medyka, which is an important place for trade exchange between Poland and the Soviet Union. The most important items are raw materials for our metallurgical industry, particularly iron ore supplied from Krivoy Rog. Deliveries of liquid fuels, mainly gasoline, have recently increased. [Text] [Warsaw Domestic Service in Polish 1900 GMT 1 Mar 86 LD] /6662

COOPERATION WITH BULGARIA--A meeting of the Polish-Bulgarian Commission for Economic Cooperation charied by Deputy Premiers Wladyslaw Gwiazda and Andrey Lukanov ended in Sofia. The results of last year's trade exchange were assessed positively and a protocol on trade exchange this year was signed. It envisages a 10 percent increase in turnover. [Text] [Warsaw Domestic Service in Polish 2200 GMT 27 Feb 86 LD] /6662

1986-90 TRADE AGREEMENT WITH ROMANIA--Trade between Poland and Romania will amount to around R850 million this year, 20 percent more in comparison with the assumptions for last year. This is envisaged by a Polish-Romanian trade agreement for 1986-90 signed today in Bucharest by Andrzej Wojcik and Vasile Pungan, ministers of foreign trade of Poland and Romania, respectively. Poland will export to Romania road construction and mining equipment among other things. We will import, among other things, machine tools, drilling equipment, coal wagons, and Aro cross-country vehicles. We will receive corn, aluminum, metallurgical products, and gasoline for our coking and power industry. In the group of consumptio projects the agreement envigsages, among other things, export of Polish vodka and import of Romanian furniture, net curtains, medicines, sport and tourist equipment, as well as wines and champagnes. [Text] [Warsaw Domestic Service in Polish 1900 GMT 4 Feb 86 LD] /6662

SCIENTISTS IN PRC--Beijing, Feb 28--A delegation of Poland's office for Scientific and Technological Progress and Applications has visited People's China at the invitation from the head of China's State Committee for Science and Technology. During the talks, the Polish delegation and the Chinese [word indistinct] initialed draft "programme for Polish-Chinese Cooperation in Science and Technology for 1986-1990" and a protocol on direct cooperation between Poland's Office for Scientific and Technological Progress and Applications and China's State Committee for Science and Technology. The Polish delegation was received by head of China's State Committee for Science and Technology Song Jian. [Text] [Warsaw PAP in English 2004 GMT 28 Feb 86 LD] /6662

FOREIGN TRADE OFFICIAL ASSIGNED--Warsaw, March 3--On the motion from the minister of foreign trade, the president of the Council of State recalled as of today Antoni Karas from the post of undersecretary of state in the Ministry of Foreign Trade, in connection with his being appointed to diplomatic service. At the meeting with foreign trade officials, Minister Andrzej Wojcik thanked Antoni Karas for his long-time work on the post. [Text] [Warsaw PAP in English 1711 GMT 3 Mar 86 LD] /6662

ECONOMY ROMANIA

FACTORS AFFECTING FULFILLMENT OF EXPORT PLAN

Bucharest REVISTA ECONOMICA in Romanian 17, 31 Jan 86

[Article by D. Aldea]

[17 Jan 86, pp 13-14]

[Text] The national transport system is to make a major contribution in both export and import operations to the objective of a 12-15 percent increase in the volume of foreign trade in 1986.

According to the law on the plan, the material base of transportation will be increased by 65 diesel and electric locomotives, 3,000 conventional freight cars on four axles, nonautomotive river vessels with a capacity of 178,000 tons, 25 river tugboats and pushers, and seagoing ships with a capacity of 641,000 tons dead weight. This will permit more intensive use of the Danube and the Danube-Black Sea Canal for freight traffic, greater coverage of the requirements for sea shipping by the Romanian fleet, and better use of the facilities in the inventory and the services rendered, all of which will make for elimination of the deficit in the balance of international transportation.

In addition to the technical measures in the way of expanding modern shipping technologies such as pallet and container shipping and mechanized loading and unloading operations, an effort will be made to improve management and organization of all transport systems (reducing idle time of ships and of freight cars in stations and marshalling, shortening repair periods and conserving fuels) and also of contractual relationships, which are basic to the economic mechanism in this activity.

Services in Connection with Export-Import Operations

Foreign trade activities, like those of international economic cooperation and according to the system specified by the current legislation, are effected through special kinds of economic contracts that in general we can call service contracts for export-import operations. In particular they are transport contracts (by rail, sea, highway, air and river), contracts to check the quality of the goods concluded between the Office for Control of Goods (OCM) and the foreign trade enterprises, etc. Although these contracts play a secondary role compared with the contracts for export and import properly speaking, that is for purchases and sales, they have no less an effect upon the efficiency of export-import operations.

The studies made within the foreign trade system revealed some shortcomings in international shipping and dispatching and especially in harbor operations, the latter taking the form of demurrage charges for exceeding the time allowed ships for loading and unloading in Romanian ports. Those payments can come to a considerable amount, which is of course also affected by market conditions. But the main reasons are two typical phenomena, namely the effect of the technical-material base of the harbors or the railroads that carry the freight to or from the harbors, and organizational defects caused either by the foreign trade enterprises because of errors in scheduling the ships' arrivals, or by railroads that do not dispatch or do not receive the freight cars on time, or by harbor enterprises failing for organizational reasons to meet the standards for loading and unloading, the responsibility for which cannot be directly assumed legally because of the lack of contractual arrangements with the dispatcher of the goods, namely the producer enterprise. Upon calling attention to these points, the meeting of the Political Executive Committee of the RCP Central Committee of 4 September 1985 (which discussed and approved the "Report on Improvement of Sea Transport Operations") requested urgent measures for radical improvement of the operations of this sector and optimal performance of its tasks. The measures to be taken must lead to better organization and management of the Romanian Sea Fleet and higher standards for operating ships in Romanian ports, and to reduction of the idle time of vessels in loading and unloading operations by performing them within time limits in keeping with the best world world results and by making full use of the national fleet's capacity. The prescribed measures are to permit shipping about 80 percent of the volume of foreign trade goods in seagoing traffic in Romanian bottoms by 1990, in accordance with the provisions of the Directives of the 13th Party Congress.

Romanian law provides four kinds of economic contracts for services in connection with export-import operations, namely the economic contract authorizing international shipments, the economic contract authorizing freighting, the economic contract authorizing harbor services, and the economic contract authorizing quality control of the goods. In all four cases the contracting parties are the foreign trade enterprises and the specialized enterprises, namely ROMTRANS (in economic contracts authorizing international shipments), NAVLOMAR (in economic contracts authorizing freighting), the OCM or other specialized enterprises (in economic contracts authorizing quality control of the goods) and various enterprises for harbor operations (in economic contracts authorizing harbor services).

The economic contract authorizing international shipments concerns special services rendered by ROMTRANS, as authorized agent, in connection with international shipping and forewarding of exports and imports in rail, highway, air, postal, combined, containerized and through traffic, and with other activities pertaining to them (specialized consultations, insurance of goods in transit, payment of duties on the goods, etc.).

The economic contract authorizing freighting essentially concerns freighting the tonnage needed for shipping the exports and imports by sea. NAVLOMAR, as the authorized agent, also renders other related services (specialized consultations, insurance of goods in transit, etc.).

"Fluent" Trade Flows

The analyses made indicate that failure to secure transport means, lack of operative berths or container platforms, or failure to secure ships are among the factors that interfere with fulfillment of the export plan, often second only to failure to procure the merchandise.

Transportation is a major component of the costs of production and sales, and accordingly a continuing effort is made to keep reducing those outlays through suitable organizational measures, careful planning of shipments, use of the most modern and efficient facilities (pallets, containers, portal-to-portal shipping), rationalization of routes, avoidance of waits and other considerations entering into the series of efforts to rationalize transportation, all of them alike being ways of cutting costs.

The shortage of rolling stock in some periods leads not only to nonfulfillment of the export plan but also to material losses in the form of major immobilizations of the funds represented by the goods produced and stored, the value of which cannot be collected by the producer.

Uniform monthly staging of the annual plan by merely dividing it into 12 months, a measure sometimes resorted to in drafting the transportation plan, is far from an ideal solution because of the seasonal fluctuation in the foreign demand as well as the difference in the demands upon the transport capacities in different periods. Therefore we must allow for the foreign market conditions in applying the various penalties for violating the obligations in domestic economic contracts (Of course we mean contracts contingent upon performance of export-import operations). For example, reception of goods by partners is slow in July and August, the peak period for vacations.

Updated Standards for Shipping and Dispatching

Whereas river shipping in inland traffic (cabotage) as well as freight handling and reloading and other operations in Romanian ports are governed by a regulation on shipping via navigable Romanian waterways (approved by HCM No 1369 effective as of 1 January 1963) in addition to the old Regulations on Commercial Use of Ports (approved by HCM No 976 of 1954), for sea shipping in general we still find pertinent provisions only in the Romanian Trade Code enacted in 1887. The CFR Transport Regulations must also be revised on the basis of current trade practice and usages if they are to become a uniform and complete regulation of new transport means and methods such as containerized or combined shipping etc. We note that the current legislation also includes a definition of a container, because in case of litigation disputes like the one about the nature of a container, whether it is a commodity or a transport means, have to be settled empirically. In the case of combined containerized shipping serious difficulties also arise in determining the time any damage occurred and accordingly the responsible carrier.

Moreover for the same typical situation (occurrence of damage in transit) we find that the legislation on river shipping is not without gaps either. The

The current regulations stipulate that the way to establish any damage is to draw up a report with the captain of the barge. But what happens when the barges are just towed? It has been tried in practice to draw up such reports with the harbor masters of the ports of destination, but the arbitration courts have not recognized the legal validity of that measure for lack of any legal basis.

And finally there is one more problem in connection with freight handling in port, where accidents may occur. In such situations there are international limits to the stevedors' (dockhands') responsibility, and there are dockhands' "General Conditions" in every port. For example, Article 11 of the General Conditions of the Hamburg Stevedores Association (1979) specifies that "The maximum damages payable by a dockhand will not exceed 1 Deutschmark per kilogram or 500 Deutschmarks per packet. Responsibility for all cases regardless of cause will be limited to 20,000 Deutschmarks for the cargo and vessel together. If several parties are involved, the total amount of the damages will be limited to the above-mentioned sum for all plaintiffs." It should be noted that the same "General Conditions" specify a very short time limit (6 months) for any complaints lodged against the dockhands.

Although preferential use of Romanian transport means to ship explorts and imports is recommended, some foreign trade enterprises prefer to sell goods FOB, meaning a buyer has to provide sea transportation. To be sure CIF sales are usually more advantageous to exporters, provided that NAVROMUL charges competitive freight rates.

The greater contribution that international shipping can make to the effectiveness of Romanian foreign trade calls for enactment of a body of laws suited to the present state and developmental prospects of the transport means and the international trade exchanges, in correlation with the international standards in this field. It is also necessary to regularize the current and future provisions in a transportation code reflecting international practice and usages in the field and stating the methods of planning transportation more clearly and precisely, allowing for their future effects upon formation and execution of the economic contracts for services for export-import operations and taking account of the need for the most flexible and yet most exact correlation of the contracts for sales in international trade, the economic contracts for consignment and delivery, and the economic contracts for services. The rights and obligations of the parties to the contracts for transport services must be precisely defined as well as the resulting responsibility of each of the parties. The model contracts for this activity must be updated and supplemented with specification of the plan requirements, introduction of long-term contracts, revision of the customary terminology, adequate contractual arrangements for control of fulfillment of the assumed obligations, etc.

/31 Jan 86, pp 14-15/

/Text/ In the current five-year plan Romanian industry's export offering will continue to show significant gains in both quantity and quality and in the way of preferential promotion, within a diversified structure, of the exports of the peak industrial sectors, namely machine building, synthesis chemistry, electronics, microelectronics etc. Varietal diversification and structural improvement of the offering must also be accompanied by diversification of the marketing procedures and their better adjustment to the objective, and to that end the policy of complex exports must be promoted as a better way to enhance the effectiveness of Romania's foreign trade. Complex exports result not only in a better sale on the foreign market of the machines and equipment manufactured by the machine building industry but also in exports of engineering services, technology and Romanian expertise.

The keen competition in complex deliveries on the world market is indicative of all exporters' major interest in this kind of operation in their approach to the market because it is economically highly effective and also involves new structures with high performances. Under these circumstances the effort of the producer enterprises and centrals, the foreign trade enterprises and the competent organs to promote Romanian exports through contracts for complex deliveries and better organization in order to develop operations of this kind seems justified and urgent. Meanwhile the levers in the economic mechanism of foreign trade that can help to concentrate efforts on successful participation (bidding for example) in such operations must be determined and put to effective use.

Complex exports involve a great many related and complementary activities each of which corresponds to a traditional trade operation such as international sales, transfer of licenses, know-how, consulting and engineering, lending technical aid, performing construction-installation operations etc., activities that all together serve the single, definite purpose of performing a function. The characteristics that distinguish the individual operations for complex export deliveries call for adjustments and improvements in the Romanian foreign trade mechanism as contrasted with the simple buying and selling operations.

Some studies made in a number of units producing exports and foreign trade enterprises made it possible to formulate a series of proposed organizational-legal measures which we present below.

Complex Exports and Suppliers' Responsibilities

Complex export deliveries have been the subjects of a number of relatively recent regulatory acts such as Law No 1 of 1971, Law No 12 of 1980, Decree No 242 of 1974, Decrees Nos 137 and 139 of 1984, Law No 71 of 1969 and Law No 7 of 1977. These regulatory instruments concern the methods of implementing complex exports, especially in connection with the legal relationships of international trade. But there is room for improvement in the present regulatory provisions on this subject, as regards regulation of the internal relationships that are instituted between the domestic general supplier and his subsuppliers in the course of complex export deliveries.

Clearly the contractural terms that are set in these situations can take only the form of economic contracts for purchases and sales. But the introduction of special terms makes that form unsuitable for the contract that is concluded between the general domestic supplier and his subsupplier. According to the present regulatory provisions the parties concluding and executing the contracts for complex exports are the general foreign supplier (usually a foreign trade enterprise), the general domestic supplier (an industrial central or other economic unit as specified in Article 58 of Law No 71 of 1969), the subsupplier of equipment, machinery and materials, the general designer for research and design projects, and the general contractor for construction projects.

One of the first points indicated by the Romanian studies and analyses is the need of heightening the subsuppliers' responsibility for failure to honor their assumed contractual obligations. Disregard of contractual discipline by subsuppliers may have much more extensive effects upon the progress of complex delivery operations than in the case of the traditional operations. For example, failure of a subsupplier unit to deliver parts or subassemblies of relatively low value (and consequently not greatly affecting the respective enterprise's fulfillment of its plan tasks) may hold up an entire complex delivery operation. In such cases the general domestic supplier has to pay his foreign partner far greater penalties than he would collect from the delinquent subsupplier. Since the laws in force do not solve this problem, the specialists have formulated various opinions as to the extent of the liability of the subsupplier who has not met his obligations adequately, such as complete compensation for the damage done, division of the liability between the subsupplier and the general domestic supplier, and finally limitation of the subsupplier's liability to the penalties provided by Law No 71 of 1969.

By another alternative that differs legally from the first of the foregoing opinions but is basically the same economically, the subsupplier is held liable for the penalties provided by Law No 71 of 1969 and for additional damages only insofar as the damage done is not covered by the amount of those penalties. We also note the proposals made by the specialists in production to improve the present regulatory provisions by charging the supplier percentages of the shortfalls in the enterprises' finished products. As far as we are concerned, we feel it would be desirable to revise the present regulatory provisions by increasing the penalties in cases of this kind.

Furthermore organizational measures must be taken to expedite preparation and implementation of special integration programs, especially for series products and those of low value, as required by the party and state administrations. Cooperation between general suppliers and subsuppliers concerning these products is considered economically ineffective by both parties and it can cause difficulties in implementing complex exports. The functional importance of small components, parts or subassembles is sometimes overlooked, especially by subsuppliers, although the complex delivery cannot be made without them, nor can the disturbances caused by these deliveries be compensated for by the general domestic supplier in terms of value.

The problem of incentives, as well as that of increasing subsuppliers' liability, is of urgent importance. Indirect exports, which are included as a task in the subsuppliers' production plans, cannot be less important to them than the direct export tasks. The importance of an indirect export, say that of 100 copies of an electric engine delivered as part of some complex exports to the value of 1 million monetary units, is macroeconomic compared with the direct export of the same engines to the value of 100,000 monetary units. Accordingly the problem of penalties, which are a post-factum measure to remedy damage already done, appears secondary in comparison with that of securing the conclusion and exemplary execution of the complex delivery contracts. The fact that subsuppliers receive no advances or credits, as they do in the case of production for direct export, for production for delivery according to subsupply contracts is another point about incentives.

Simplified Execution As an Effective Incentive

Another series of problems is presented by the threefold settlement operation between (a) the foreign customer and the general foreign supplier (foreign trade enterprise), (b) the general foreign supplier and the general domestic supplier, and (c) the general domestic supplier and the subsupplier.

Two of these three settlement cycles are domestic. In addition to the man-hours spent on this duplication, which is a problem in itself, the fact is often overlooked that the general domestic suppliers are not organized to make those settlements and such employment of that personnel throughout an action is inefficient. Accordingly the suppliers agree to make out pro forma invoices to be sent directly to the foreign trade enterprises, although they would have no obligation to do so for a normal domestic contract for delivery. But it should be noted that in principle the subsupplier enterprises can refuse to make out invoices of this kind on the ground that they are not legally obligated to do so, and they sometimes do refuse, especially when they are not under the central or unit acting as general domestic supplier.

Particular questions also arise in connection with service in the course of complex deliveries. According to Decree No 117 of 1981 on Supply of Spare Parts and Organization of Service and Technical Aid Abroad for Exported Products, the ministries and other central organs with industrial centrals and enterprises producing exports under them are required to provide for production and delivery of spare parts and to organize service and technical aid abroad throughout the entire lifetimes of the exported machines, equipment, installations and other products. The exporting units can send personnel abroad to provide service, as they have a special foreign exchange fund allocated for the purpose, but subsuppliers do not qualify as exporters according to the subsupply contract and consequently do not have access to foreign exchange funds. Moreover the international standards for rendering service call for certain minimal volumes of goods delivered or services rendered, and the deliveries to the general domestic supplier do not always qualify.

Regarding the time limits on guarantees, the foreign contracts for complex deliveries can sometimes stipulate variable time limits, while the period is regulated for current domestic deliveries. Furthermore when we consider that according to Article 20 of Law No 71 of 1969 the guaranteed periods are to be set for all cooperating suppliers according to the contracts for cooperation that are concluded by the general domestic supplier with the specialized units, and that the time limits on the guarantee run from "the date the delivered item is turned over to the beneficiary," it actually follows that subsuppliers are obligated to set guaranteed periods that are usually longer than those specified in the ordinary delivery contracts. In view of the foregoing we feel that some solutions should be found that would compensate the subsuppliers for these disadvantages and encourage them participate in complex delivery operations for export.

Technical and Commercial Competitiveness of the Offering

In order to expedite foreign market prospecting and preparation of the offerings for bids, in addition to improving the technical-material inventory in order to make the technical offerings more attractive, it is necessary to advance some personnel (a team) in these sectors who have specialized training, great competence and suitable technical and legal experience in addition to adequate knowledge of economics and world languages. The need of highly qualified personnel is also being felt in the other segments of the cycle, such as preparation of offerings, negotiation and execution.

If the offering possibilities are to be enhanced we must have access to the most extensive portfolio of licenses possible and especially to their prompt purchase on economically justified terms. The research and design institutes must keep working on their technologies in order to raise their technical standards and adjust them to the foreign customers' particular demands.

More effective complex deliveries heavily depend upon improved methods of calculating prices of deliveries of goods and services, including construction-installation projects. Anomalies sometimes occur in evaluation of the domestic costs for machines, installations, spare parts, overhead etc. The specialists in complex deliveries estimate that the proportion of the value of the designs and engineering incorporated in the Romanian enterprises' offerings and contracts in the total cost of the exported installations is lower in comparison with the practice on the world market. It is also necessary to give special attention to the designs, engineering, licenses, know-how and technical documentation as items to be evaluated separately from other costs in the contract for complex deliveries. It is especially important to develop uniform systems for evaluating the costs so that they can be rapidly adjusted to particular parameters by means of computers, avoiding preparation of the preliminary offerings in too great detail, which is neither economic nor efficient and leads to delays in presenting the offerings. In general, it is found that the enterprises sometimes have difficulties in conforming to the foreign partners' time limits, especially in the case of bids. There are still reserves in the information-approval-offering cycle that must be exploited, as well as rigidities whose elimination would make the system more flexible and its performance more efficient.

The Directives of the 13th RCP Congress coneerning Romania's socioeconomic development in the 1986-1990 Five-Year Plan call for further expansion of the higher forms of international economic cooperation through joint construction and operation of production capacities, founding mixed companies to export products, and joint ventures on third markets, considerably enhancing the economic effectiveness of this activity.

Complex deliveries, as one of the chief forms taken by international economic cooperation, are directly or indirectly involved in the programs for these purposes, so that improvement of the economic-financial mechanism and of the legislation governing the conclusion and execution of complex delivery contracts will directly contribute to one of the priority aims of this year and of the entire Five-Year Plan.

EXAMPLE OF 'MILITARIZED REGIME OF WORK' DISCUSSED

Zagreb DANAS in Serbo-Croatian 29 Oct 85 pp 30-31

[Article by Miroslav Lazanski]

[Text] What is the meaning of the "Militarized Regime of Work" which has recently been introduced at the energy-producing enterprises? Our journalist is describing the experiences from a similar Romanian factory.

Romanian President Nicolae Ceausescu had dismissed several ministers because the country energy program was not successful and because of the serious errors in the Ministry of Electric Power Industry. Forced to resign were Nicolae Busui, former minister of electrical energy; Ion Avran, first deputy prime minister; and Marin Stefanace, minister of mining. At the same time, by presidential decree that was announced after the meeting of the Executive Committee of the RCP Central Committee, a state of emergency with a militarized regime of production and with military commanders was imposed at all electrical industry plants. Despite Romania's annual production of about 70 billion kilowatt hours of electricity, it still does not satisfy the needs of the industry which is constantly expanding. New mines are being opened, new coal-fired thermal electric power plants are being put into operation, and a certain amount of electricity is being imported from Albania and the Soviet Union. The Romanians are also conducting a campaign for the building of wind and solar-generated power stations, and the first Romanian nuclear power plant, built with Canadian assistance , is supposed to begin to operate next year.

In order to ease the energy crisis, Romania needs to import about 3.5 million tons of crude oil from the Soviet Union which, together with the domestic production of an annual 11.6 million tons, still cannot satisfy all the needs (the Romanians are importing crude oil from other countries, as well). Because of all these reasons in the last several years the country has been carrying out a rigid program of energy saving and, according to the Romanian press, a "militarized regime of work" will soon come into effect at the energy producing enterprises.

What kind of discipline exists in the Romanian enterprises, how is the Party realizing the plans of the enterprises, and are there in peacetime certain elements of a military discipline in Romanian factories? During his stay in

Romania, the author of this article had the opportunity to familiarize himself with the life and the organization of the large IMUA factory (Intreprinderea de Masini Unelte si Agregate) in which 7,000 people are presently employed. At the entrance of the factory on Muncii Boulevard number 250, I was greeted by the president of the Workers Council and the secretary of the factory's party committee Niculescu Mihalache, who is at the same time commander of the Patriotic Guard of the IMUA factory and holds the rank of senior lieutenant in reserve; and by the chief of staff of the factory's Patriotic Guard, engineer Virgolici Oliviu (senior lieutenant in reserve); by the secretary of the committee of youth Stefan Grigore; by the commander of the civil defense Patru Constantin; by the president of the organization of women, engineer Georgiana Moraru (second lieutenant in reserve); by the chief of staff for the civil defense of the city of Bucharest Colonel Pop Alexandru; by a member of this staff Lieutenant Colonel Bratulescu Radu; as well as by Lieutenant Colonel Balanescu Constantin, the deputy chief of staff of the Third Sector of the Patriotic Guard in Bucharest, the district where the IMUA enterprise is located.

The factory started to produce heavy machinery and machine tools in 1976; most of the products were exported. IMUA is a member of the group of factories which produce machine tools (there are 17 enterprises in all of Romania) and the factory with its staff is typical of its kind. There are four main sections in the factory: machines, machines for the electric-power industry, the section for the production of gears and very heavy machines. The production range is wide, the precision in metal processing ranges to 0.2 micrones. The lathes which IMUA has been exporting to all continents weigh about a hundred tons and the production of the new generation of machines is computerized. Generally speaking, this factory, together with the Romanian airplane industry, currently represents the technological peak of this country.

The Workers Council is the collective body of self-management, its members being elected every year when the production results are calculated. The highest body of the factory is the Workers Assembly, which consists of the appointed representatives of the factory sections. It decides whether the president, his deputies and assistants will keep their posts, which depends upon the results of economic operation. The party secretary of the factory is at the same time president of the Workers Council, the factory director is its first vice president, and its other vice presidents are the secretary of the youth organization and the president of the organization of women. The Workers Council and the Workers Assembly are in charge of deciding all company's questions and the rule is that all managers keep their positions as long as their performance is satisfactory and the factory is operating well. Rotation of the managerial positions is not compulsory. The Workers Council and the Workers Assembly also decide the fate of those who failed at their functions. The decisions of the Workers Council are obligatory for all factory employees, and on the occasion of voting no member of the Workers Council has right of veto and decisions are made by simple majority.

The military and semimilitary formations of the factory employees include the civil defense, a fire-fighting unit and the Patriotic Guard. The city of Bucharest has six defense sectors for the Patriotic Guard and each sector has its training and target practice ground. The units of the Patriotic Guard are otherwise organized according to the three principles: territorial, producing and voluntary. Territorial: formation and the structure of the units of the Patriotic Guard coincide with the administrative division of the territories and the city. Producing: this is the most common principle; the troops of the Patriotic Guard are being formed practically in all areas, institutions, enterprises, depending on the size and importance. Members of the units of the Patriotic Guard can be workers, peasants, intellectuals, men, women, and volunteers can be admitted, too.

Applications for admission are decided by the Party Committee of the appropriate institution, enterprise or commune. The Patriotic Guard at the IMUA factory is organized into infantry platoons, companies and battalions, light mortar companies and platoons, antiaircraft platoons and antiarmor platoons, transportation, medical, and material supply platoons. Besides these military tasks the Patriotic Guard of the factory is also responsible for maintaining the continuity of production, order, and discipline and for the immediate protection of the factory facilities.

The units of the Patriotic Guard rely on the material resources of the army, but they also independently purchase some military material. The factory already has fortified points of defense, the underground command center is located under the workshops and has direct telephone connection with President Ceausescu.

Every year, the command cadre of the units of the Patriotic Guard of the IMUA factory leaves for a 6-day military training and meeting and the program of military training and target practice given to the participants is very similar to that for the soldiers of the regular Romanian Army. After completing military service, all participants become members of the Patriotic Guard of the enterprises, and the Army uses them as its reserve. All managerial positions at the IMUA factory are filled by reserve officers of the Romanian Armed Forces, and during large maneuvers many members of the Patriotic Guard of the IMUA plant join regular Army units, but it is not detrimental to the production. For this is exactly the purpose of the maneuvers: to simulate a situation when the Army uses its reserve among the workers of the enterprises.

Weapons and the equipment for the participants of the Patriotic Guard are kept in separate storehouses at the factory. We had the chance to take a peek at these places, too, and to assure ourselves of its solid firepower: antiaircraft artillery of 30 and 37 mm, antiarmor artillery of 57 mm, hand grenades, recoilless rifles, flame throwers, automatic firearms of the AK-47 system....

The impression which an outside observer gets after visiting the IMUA factory sections in Bucharest and talking to its workers is the following: This is a very modern enterprise with a strong party organization, an enterprise which has both the organs of self-management and the elements of military discipline.

BRIEFS

SFRY TRADE WITH HUNGARY--In 1985 the volume of trade and services with Hungary was valued at $550 million, considerably less than the planned $700 million. Trade last year was accomplished by problems, especially late contracting of mutual delivery of goods, problems relating to payments and agreement on prices. These problems appeared also in border trade with Hungary which is our largest partner in border trade after Italy and Austria; thus, only $50 million worth of goods was traded instead of the planned $90 million last year. However, in regard to services, the problem of the Yugoslav railroads' debts, which had burdened Yugoslav-Hungarian economic relations for the last few years, was resolved. According to the 1986 trade protocol, the volume of exchange is planned at $850 million, with Yugoslav exports at $375 million and Yugoslav imports at $355 million. The value of services in both directions is planned at $120 million. [Excerpt] [Belgrade PRIVREDNI PREGLED in Serbo-Croatian 31 Jan 86 p 1] /12947

SFRY TRADE WITH USSR, MONGOLIA--Last year Yugoslav-USSR trade amounted to $6.312 billion, or 1.4 percent more than in 1984. This year the volume of trade should be $6.5 billion, and as of 10 February 1986 about $553 million had been carried out. But it is already clear that prices for energy raw materials will affect the course and structure of trade. These are very important, and the Yugoslav economy will need to seek ways with the Soviet partners of compensating for the differences through new and different deliveries [from the USSR]. One must keep in mind in this regard the desire of partners to deliver more machines and equipment. In regard to Mongolia, trade last year amounted to $8.2 million (Yugoslav exports were $5.4 million and imports $2.8 million). In 1986 $6.7 million worth of trade has been agreed upon, and for the 1986-1990 period, $42 million, compared to the $39 million for the previous 5-year period. GENERAL STAFF MEETS ON MILITARY ACADEMY RECRUITMENT

Warsaw ZOLNIERZ WOLNOSCI in Polish 28 Jan 86 p 1

[Article by [jas]: "Military Academy Recruitment Affairs"]

[Text] On 27 January 1986, a session of the Central Coordinating Commission on Recruitment Affairs for Professional Military Academies met for the first time this year under the auspices of the General Staff of the Polish Army.

Representatives of the party Central Committee Department for Youth Affairs, the Ministry of Education, the Main Bureaux of the Socialist Youth Movement and Peasant Youth Union, the Main Headquarters of the Polish Scouts' Association, as well as the National Defense League and Polish Aeroclub were invited to participate in the commission's work.

Brigadier General Jan Wojtala, the deputy chief of the General Staff, was the commission's chairperson and directed the proceedings. Also present were the vice-chairperson of the commission, Brigadier General Stanislaw Wytyczak, and the deputy chief of the Main Political Bureau of the Polish Army, Professor Colonel Mieczyslaw Michalik.

It was affirmed during the session that the influx of candidates to military academies was facilitated by the types of climate which were developed among local political authorities, the state administration, and educators, as well as in youth organizations, plants, and schools by the Letter of the party Central Committee of 5 September 1984 on matters of ideological and educational work with pre-recruited and recruited young people, as well as by the decree of the chairperson of the Council of Ministers of the Polish People's Republic of 7 May 1984 which applies to these matters.

Military schooling, as with civilian schooling, is experiencing a rather distinctly universal reduction in the public's interest in higher education.

However, a decent number of candidates have been found. This is the result of the intensive ideological and educational, and informational-propagandistic efforts conducted among school- and recently graduated young people.

It is clear from the degree of differentiation in the recruitment of candidates to professional military academies in individual provinces that the above-mentioned efforts are not being conducted everywhere with the same intensiveness and success. This means that there are still reserves to be tapped in the activities of provincial defense committees and provincial coordinating commissions.

It was emphasized during the session that there was a requirement to improve informational-propagandistic activity, increase its quality and influence by individualizing efforts with candidates, intensify the efforts of youth organizations, and provide the young with the opportunity offered by the military profession, an opportunity which is both publicly necessary and beneficial.

Referring to proposals and resolutions, Brigadier General Jan Wojtala stressed that the issue of recruiting candidates to military academies and schools is vitally important to the armed forces. Young people, entering the soldier's profession today, will shape the image of the army and the character of our socialist armed forces far into the 21st century. The general also talked about the most important tasks facing the commission in the near future.

SYMPOSIUM ON STRESS MANAGEMENT IN ARMED FORCES

Warsaw ZOLNIERZ WOLNOSCI in Polish 28 Jan 86 p 5

[Article by Major Cieslaw Warych: "Combatting Stress And Strengthening Soldierly Comradeship"]

[Text] Military service is a school of hard knocks. The young who serve have many new rigors and obligations. The change in environment, the need to adhere scrupulously to regulations and rules, the execution of difficult tasks under various conditions and in difficult environs, and the separation from loved ones can all lead to the emergence of stress. Soldiers, during their first months of service, are particularly susceptible to stress; they are especially susceptible from a psychological aspect as well.

Dealing with this stress, creating a friendly service atmosphere, strengthening soldierly comradeship, and forming proper interpersonal relations are the basic tasks facing lower-level commanders, political officers, and party and youth organizations. Results, so far, have been positive.

However, we have to deal in occasional instances with soldiers who cannot cope with personal or service-related problems. In such situations, the absence of a helping hand and the support of colleagues and superiors can result in discouragement, apathy, and the emergence of depression.

A scientific symposium, organized by the Political Bureau of the Silesian Military District, took place in Wroclaw to discuss these phenomena and to work out ways of dealing with them. Representatives from many organizations were invited to participate in the symposium: commanders, political officers, party and youth activists, psychologists, doctors, lawyers, officers from the Provincial Military Headquarters, court procurators, and lecturers from military academies and schools. Also present were representatives from the military districts and branches of the armed forces.

Colonel Hieronim Badyna, a representative from the Main Political Bureau of the Polish Army, also participated in the symposium which was directed by the chief of the Silesian Political Bureau of the military district, Bde Gen, Dr. Zdzislaw Rozbicki.

In his opening remarks, Bde Gen, Dr. Zdzislaw Rozbicki pointed to the major role played by commanders, collectives, soldier groups, and youth organizations in the process of helping soldiers adapt to the conditions of military service. The subunit commander, from the viewpoint of the unusually key role he plays, also has to be the friendly protector and teacher of the soldiers subordinate to him; he must also simultaneously create a climate which encourages activeness and a desire to lead in both service and work.

In order for commanders to deal with this task, they have to get to know thoroughly their subordinates, their interests and expectations, their needs, concerns, joys, and problems with which they themselves are unable to contend. The acquisition of this information is necessary in a soldier's first few days of military service. The commander needs to apply the correct educational methods in the area of basic training and facilitate the soldiers' adaptation in his subunits.

Speaking about the course of the adaptation process, the chief of the District Political Bureau made references to the kind of work with soldiers who experience difficulties in adapting to military service. This work includes personal concern, individual sponsorship, and friendly help. The general affirmed that the indifference of colleagues, neglect of soldiers' difficulties in their adaptation to service, and insensibility to their concerns and problems are the chief causes of stress.

Further along in the symposium, Colonel, Doctor Franciszek Futyma from the Higher Engineer Officers School explained the behavior of soldiers in difficult situations and the role of military instructors in the limitation and elimination of the effects of stress. Colonel, Doctor Edmund Krazynski, an officer from the Psychology Faculty of the Military Political Academy, delivered an interesting report on the theoretical problems of autoaggression. Lieutenant Colonel, Doctor Janusz Lachowicz from the Higher Mechanized Troop Officers School and Lieutenant Colonel Jerzy Gorzala from the Higher Engineer Officers School present to the symposium's participants many interesting observations on the causes of stress and depression, and on how to overcome them.

During the discussion, in which Colonel Stanislaw Torepko, Lieutenant Colonel, and Doctor of Medical Sciences Antoni Florkowski, Colonel Aleksander Mazurek, and Colonel Hieronim Badyna spoke, much attention was focused on the characterization of the role of commanders at all levels in the development of the proper military service atmosphere and correct inter-personal relations. The participants also discussed the tasks of the party and youth organization in recognizing the moods prevailing in the collectives and providing the necessary assistance to those soldiers who most need it.

The formation of inter-personal relations compatible to the basic rule that a "soldier is a soldier's best friend," the combination of requirements with a concern for subordinates, the efficient recognition and shaping of moods, considered response to requests made by soldiers, the strengthening of the role of party organizations and the Polish Socialist Youth Movement in the building of collectives and the creation of a proper service atmosphere, the restoration to non-commissioned officers of basic military service of their role, and their execution of duty services in accordance with current regulations are all the basic trends of action emerging from the symposium. The rigorous implementation of these ideas will ensure not only the proper course of a soldier's adaptation process, but will also combat the emergence of stress and depression in service life.

NEW PEACE, HUMAN RIGHTS GROUP REPORTED FORMED

Stockholm DAGENS NYHETER in Swedish 22 Feb 86 p 15

[Article by Disa Hastad datelined East Berlin: "New Peace Group Outside the Party"]

[Text] A new unofficial peace group which has human rights on its program as well has recently been founded in the GDR. The group is the first of its kind in Eastern Europe.

In the past such groups have generally separated peace and human rights.

In a communication distributed this week in East Berlin the group's spokesmen wrote:

"The aim of peace work cannot be separated from basic democratic rights and freedoms. The arms race is being conducted over people's heads and peace movement activists are persecuted and partly regarded as criminals. In this regard 'Western democracies' are no better than our own governments."

Since 1983-84 several members of the unofficial peace movement have been taken to court and buttons with the slogan "Swords into ploughshares" have begun to be regarded with disapproval. Accordingly the peace movement has operated quietly in recent years.

Churches are still centers for the movement, with more or less official encouragement. Next to the churches there is a number of small, autonomous groups devoting themselves to intensive and thematic studies of peace questions.

Emigrated

Nevertheless the movement has been decimated. Many of the old activists have emigrated to the West or have been ransomed by the Federal Republic after having served a prison sentence.

"But many new members are now coming to us," Ralf Hirsch, one of the new group's spokesmen, told DAGENS NYHETER.

The new group, which has contacts in three cities and counts about a hundred faithful, will work openly through letters (but not through demonstrations) and has three spokesmen who are changed each year. The three current spokesmen, Ralf Hirsch, Wolfgang Templin and Peter Grimm, all in Berlin, have worked in the peace movement for a long time.

In September they submitted a letter signed by approximately 20 people to the government of the GDR and demanded the lifting of a ban on travel which affected peace activists. Indeed citizens of the GDR can travel freely and when they want to Poland and Czechoslovakia and to Hungary as well if they obtain a Hungarian visa.

But many who traveled discovered at the border that they were clearly on a black list when they were stopped by GDR border guards. In particular it is believed that the authorities are afraid of unofficial contacts between Solidarity and the Czech Charter 77 and the German activists.

No Certificate

In a letter to last summer's Moscow youth festival, the group pointed out that restrictions within the GDR (passports are required for trips to the Soviet Union) prevented them from attending the festival when they wanted to. In their letter they stated their opinion that youth can develop only if they live with freedom of speech, freedom of information, freedom to live where one wishes, freedom of assembly, the right to equal opportunity in education and the right to choose the way one thinks.

In recent years the authorities have not arrested the peace activists, but those who refuse to participate in shooting practice receive no certificate showing that they have received an education. There is no overt ban on employment, but the activists have observed that they have few opportunities to work for the government.

There exists a large and very extensive official peace movement in the GDR and peace is the first item at the party congress in April. The movement is also dear to the heart of party chief Erich Honecker.

Public figures consulted by DAGENS NYHETER are of the opinion that the unofficial peace groups have now turned to working publicly or within the church.

"And we have nothing against the church. We are only against those people who use the peace movement as a mask for anti-state activity," a person highly placed within the party apparatus told DAGENS NYHETER.

KESSLER SPEECH REVIEWS ARMY HISTORY, GOALS

AU260545 East Berlin NEUES DEUTSCHLAND in German 22-23 Feb 86 pp 3-4

[Speech by Army General Heinz Kessler, Minister for National Defense, delivered at the NVA 30th anniversary celebration in East Berlin on 21 February 1986: "Three Decades of the NVA Reflect the Unity of the People, Party and Army"]

[Text] Dear comrades, esteemed guests:

On 1 March 1986 the soldiers of the GDR together with our country's citizens, together with their brother-in-arms of the fraternal socialist armies united in the Warsaw Pact, celebrate the 30th anniversary of the National People's Army [NVA].

Three decades of the GDR's NVA--that is 30 years of action for peace, 30 years of protecting socialism in the heart of Europe.

Three decades of the NVA--that is 30 years of firm friendship and comradeship-in-arms with the Soviet Army and the other fraternal armies.

Three decades of the NVA--that is 30 years of unbreakable unity of people, party, and army on the socialist German state.

Day of Honor for All Who Have Had an Influence on the NVA's Development

In the same say as our army has developed and strengthened in the vital interest of our people and at the side of our allies, we understand and experience this anniversary also as a day of honor for all those who have had an influence on the development of our armed forces through their high personal commitment, the work of their hands and minds, their farsighted orientation, and their continuous care.

Dear comrades and friends, esteemed guests: Only a few weeks more--than here in this festive site, in our palace of the republic, the delegates of the 11th SED Party Congress will meet in order to determine, in line with our fatherland's socialist peace prospects, the tasks of the next part of the way that is facing us. As everywhere else in our country, in barracks and on training grounds, at airports, on bases, in trenches, and on dreadnoughts, remarkable efforts have been performed for weeks and months. Under the slogan "Soldier's Deed 11th Party Congress!" The army members and civilian employees are making peace more secure.

Over the past few weeks we saw at the delegates conferences of the NVA party organizations the extent of the technical knowledge and revolutionary optimism with which our comrades took the floor in order to pave the way for even higher performances and greater combat readiness with their proposals, critical suggestions, and good ideas.

Founding of the SED--Procondition for Solving the Question of Power and of Armed Forces in the Interest of the Workers Class

And it is precisely this forward-pushing elan that is the spirit in which we celebrate the 30th anniversary of the NVA during these days. We thus heed a work of the great German workers leader Ernst Thaelmann, whose 100th birthday we will commemorate this year: "For us communists," he wrote, "anniversaries are not empty memorial days but directives for the class struggle, guidelines for action."

This is also the attitude with which we look back on our history--the history of our people, our battle-tested Marxist-Leninist Party, and our armed forces; and it is not by chance that we look farther back than 1 March 1956, since the successful development of our armed forces over these 3 decades under the tested leadership of our party is rooted to an essential degree in that important historic event which will have its 40th anniversary in April--the founding of the SEDGF. The uniting of the two German workers parties on a revolutionary basis, which took place on 2 April 1946 in Berlin, the development of the SED to a Marxist-Leninist militant party was one of the elemental preconditions of answering and solving the question of power and later that of armed forces in the east of Germany in the interest of the workers class and the working people.

"We know," Comrade Wilhelm Pieck said at that time, "that the workers class will be the power to solve all tasks only if it has a united, determined, and consistent Marxist leadership."

This is a truth which has proved itself again and again since then everywhere in our society and thus also in our armed forces and which, in the future too, will remain the essential guarantee for each further step forward--toward peace and socialism, [words indistinct].

Dear comrades: When the GDR People's Chamber passed the law on establishing the NVA and the Ministry of National Defense on 18 January 1956, our worker-peasant state had already obtained its firm place. During the decade since the liberation of the German people from fascist barbarism and since the founding of the SED, imperialism and militarism had been rooted out of our territory.

The decision of our working people for progress, democracy and socialism, for a social system in which there are no monopolistic lords exploiting and oppressing the working people and no one strives for domination over other peoples and territories, had long been made at that time. Never again was war to emanate from German soil. We wanted to prove to the peoples, the appeal of the SED Party Executive Committee of 1 October 1949 stated, "That we Germans want to be the friends of all peace-loving peoples and men and never again their enemies."

And only a few days later, after Wilhelm Pieck was elected president of the GDR, Erich Honecker, chairman of the FDJ, at the until then most important post-war rally, vowed on behalf of the young generation, "to guard and protect" the first state of the people and peace on German soil, "this, our house, against the attacks of the warmongers."

Since 1917 the party of Karl Liebknecht and Ernst Thaelmann had never left any doubts that the achievements of the liberated workers and peasants had to be defended when they were in danger and that imperialism and militarism had to be held in check. Remembering the experiences of the Soviet power, of the German and international workers movement, the SED consistently advocated the Marxist-Leninist position also concerning questions of armed defense.

War Is No Law of Nature

To the same degree as the imperialist threat to "our house" mounted, the party explained the necessity of armed protection of the worker- peasant power and told the masses that there are differences between gun and gun, that war is no law of nature, and that peace is not a gift, as we FDJ members sang at the time.

The party not only warned against remilitarization in the FRG, the creation of the aggressive NATO bloc, and the integration of the West German military potential into this pact, but also, as a consequence of this dangerous threat, developed the first protection and security organs, made young volunteers from the ranks of the workers class and the other working people capable of learning the profession of arms and leading armed forces--from the first units of the People's Police to the Alert units of the Garrisoned People's Police.

And when, 30 years ago, we were faced with the task to set up our own regular army, combat-ready forces, and units of ground, air, and navy forces, this necessity was understood by our country's working people. The party had carried the thought and the will to protect and defend the socialist fatherland into the workers class, indeed into all classes and strata of our people. This fact was convincingly shown by the workers militias and the Society for Sport and Technology.

The foundations of our socialist house, in which we wanted to live and which had to be guarded, were laid and firmly embeded. At the same time, however, we were still right in the middle of the process of socialist construction, of restructuring production conditions, and of creating the material base of the new society. Much of that for which the best sons of the German people had for decades been fighting, suffering, and often giving their lives had become reality. But much was still in books, waiting on drawing boards for realization, only lived in our minds.

Thousands and thousands of young people, who took up arms in the spring and summer 1956 and took the oath of enlistment, did this with the firm determination to protect the achievements against all enemies of the working people and their rule, against all attacks on socialism. But they also took up arms convinced that our socialist cause is just and will be victorious, knowing that this great prospect can only be realized in peace, that socialist construction is always socialist work for peace because socialism needs peace in the same way as a plants needs light.

Educated in the Spirit of Internationalism

This supreme principle of our state doctrine--war must never again emanate from German soil--also determined the founding and development of the NVA, and is and remains the central and pivotal point of all our efforts in striving for high combat readiness and for reliable military protection of socialism and peace in Europe.

When substantiating the law on founding the NVA, Comrade Will Stoph, member of the SED Central Committee Politburo and first GDR minister of national defense, stated on 18 January 1956 before the People's Chamber: "In our country, in which the worker-peasant power represents the interests of the working people and of preserving peace, all military measures can only serve the safeguarding of peace and security." He thus referred to Wilhelm Pieck's programmatic statements at the Second SED Party Congress.

There the president of the first German worker-peasant state had outlined the shape of the future army, whose members are educated in the spirit of internationalism, in the spirit of respect for other peoples, in the spirit of love for the workers of all countries, in the spirit of safeguarding and consolidating peace between the peoples.

FDJ Took Over Patronage of Armed Organs

In this spirit and according to these guidelines the army of the German worker-peasant state was founded, structured, and led and has been recruited, trained, and educated--as an army of the people. It is therefore only natural that from the very beginning our army has been enjoying the trust and care of the working people, of all classes and strata of our socialist society.

This was the case in 1956, when the representatives of all democratic parties, members of all social strata and professions, atheists, and Christians supported the establishment of the NVA. The FDJ, which had taken over patronage of the armed organs in 1952, declared its willingness to accept the advanced military science and arms technology in order to protect what the working people had achieved in hard work.

At the historic People's Chamber meeting of 18 January 1956 the FDGB spokesman said: "The worker-peasant army defends our state-owned enterprises, which were laboriously reconstructed by the workers after 1945 and today belong to the people. It defends the soil which was taken away from the junkers; it defends the right of the working people to active participation in the management and planning of production and the state and the right of the workers' children to be able to study; it defends social security and our holiday homes, the childrens' holiday camps, and our great cultural and sports facilities; it defends the trade unions, democratic rights, and the political liberties of the working people."

And this has remained so, dear comrades and friends. Our NVA has been able to develop in a positive way because thousands of threads connect it with all parts of our society, because its mission to protect peace and socialism corresponds with our state's policy and our people's vital interests, and because every day and every hour it received powerful material and spiritual stimuli, strength, and confidence from the people.

Many pages in the book of honor of our armed forces' history would have to be filled if one wants to describe everything with which they have proved that they are the flesh and blood of the working people.

Antifascist Fighters Were Entrusted With Establishing the NVA

The party entrusted the establishments and leadership of the NVA to sons of the German people who had proved themselves at the various fronts of antifascist resistance, who had once worn the rags of fascist concentration camps or prisons, the uniform of the Spanish People's Army or the Red Army, and who were now awarded general's shoulder straps of the NVA or who led our first units and military forces as commanders and political workers. Many of those tested antifascists have left the ranks of the army because of age; to some of the comrades we already had to pay our last respects. But their attitude and their example are still alive in the military forces and units which bear their names and in today's young army members.

Younger comrades, the FDJ members of the fifties and sixties, have taken the place of these general and officers. Indeed, there are already commanders, chiefs of staff, political workers, and graduates of military academies who were only born in 1956!

Today, as in 1956, the corps of our leading cadre is homogenous in its social composition and politically and morally firmly linked with the workers class.

Today more than 80 percent of the officers, more than 90 percent of the officer candidates and professional noncommissioned officers are sons of workers or working cooperative peasants. The great majority of the officers, too, were themselves workers in production before they enlisted in the army.

Thousands of army members are deputies or honorary committee members in the people's representative bodies, members of parents' councils, or of National Front Committees.

Partnership and patronage relations between the army units, enterprises, and socialist brigades in industry and agriculture, between the military educational institutions and universities, between our army and our youth association are very close.

Innumerable are the activities particularly in the reservists' collectives, in the Society for Sport and Technology, and in the FDJ for premilitary training and socialist defense education, for preparing for military service and for the military professions, or for preserving the military capabilities of the reservists.

We thank the working people of the GDR and their youth from the bottom of our hearts for this great support in doing our military duty.

We thank the workers in town and countryside, the teachers, scientists, and cultural workers, the craftsmen, and small businessmen. We thank our country's communists and the members of the parties united in the democratic bloc, of the FDGB, the FDJ, and all other mass organizations for everything that they have done for our army and our army members.

Friendly Advice and Fraternal Help From the Soviet Army

Dear comrades, esteemed guests: One of the undying historic achievements of the SED and its Central Committee is that long before the establishment of the NVA it led our country's working people, and particularly the youth, on the way of friendship with the Soviet people and all fraternal socialist countries.

"It was in line with the international character of the workers class and the progress in shaping the community of socialist states," Comrade Erich Honecker, general secretary of the SED Central Committee, wrote, "that from the very start we considered military protection of socialism in the GDR as a collective, internationalist task. It was possible to fulfill this task only in very close militant alliance with the USSR and its military power and with the other fraternal socialist states and their armies."

In this coalition for defending peace and the future of the peoples the NVA has stood every test in the international class struggle and has always been able to meet the requirements of the accelerating processes in military affairs.

It was in particular the Soviet Army which gave our army what it urgently needed in the military and military-technolgoical field—the material-technical basis of weapons and combat technology and the theoretical equipment, friendly advice, and fraternal aid.

Many of our generals and officers studied at Soviet military academies, became military experts of the victorious workers class, officers of the people in Lenin's country.

For all this help and for the decades of comradely cooperation for the firm comradeship-in arms, we today express our cordial thanks to the comrades of the glorious Soviet Army and Navy. Our particular gratitude goes to the members of the group of Soviet forces in Germany and its commander in chief, the Soviet advisors and military experts, the commander in chief of the Joint Forces and his representative at the NVA, the USSR minister of defense and his deputies!

Communists Have Always Been in the Lead

Dear comrades, esteemed guests: the path which the army of the socialist German state has been following for 3 decades and at which we look with justified pride today was shown by the Marxist-Leninist Party, our SED. And the communists have always been in the lead, on every part of the way, at every ascent and obstacle.

It is mainly because our party, the Central Committeee, and its Politburo has always accorded the necessary importance to the defense of the socialist achievements that the NVA and the entire national defense of the GDR has been able to develop in such a consistent and successful way and to take over more and more responsible and complicated tasks in protecting socialism in the heart of Europe.

The party leadership demanded much of us--in the development of strong and combat-ready military forces and units, in increasing the level of troop leadership, of political and combat training, and ideological work with the army members. It challenged us, also concerning aid for the young nation-states, removing the results of natural disasters, or solving top-priority economic tasks.

But at the same time the party taught us to fulfill the demands, and it dealt with the conditions under which they had to be fulfilled.

In all important stages of our army's development the Politburo and the general secretary personally deliberated with our commanders, [words indistinct], party and youth functionaries on forthcoming tasks and possible ways to fulfill them. And again and again we thus gained rich experiences in life and combat as well as farsighted guidelines and very concrete, practical suggestions.

The most important thing the party taught us then and has taught us with great emphasis since the Eighth Party Congress is care for the people on whom the combat strength and combat readiness of our armed forces depends, care for the capability, the materials and spiritual welfare of our soldiers, noncommissioned officers, officer candidates, and officers, our civilian employees, and reservists. This means care for their best possible training and education as fighters as well as for their service and living conditions.

Thirty years of NVA have proved: the leadership of the party has been and is the main source of all our successes. The party leads through the order of the commander, through the convincing argument of the political workers, through the trustful advice of the party secretary, and through comradely dicussion in the collective. The party leads in the precise fulfillment of the tasks of combat services and the ready-alert system, in the struggle for the best competition results; it leads through the example set by the communists in political and military training, through their example everywhere in life.

Therefore, the heartfelt thanks of all members and reservists of the NVA today go to the party of the workers class, our SED and its Central Committee led by our general secretary, our friend and fellow fighter, Comrade Erich Honecker!

Dear comrades and friends: What our army is, whom it serves, whose friend and whose enemy it is, is shown thousandfold and very clear in its [word indistinct], in the political attitude, in the life of its leading cadre.

Contribution to 40 Years of Peace in Europe

Our young soldiers and seamen have been and are led, educated, and trained by sons of workers and peasants, by men from the working people, by loyal friends of the Soviet Union, by communists and internationalists.

Proof of the nature of the socialist German state's army are such men as the 52-year-old miner's son Kurt Kroh, who has experienced the 3 decades of the NVA from the beginning, who, as a seaman, qualified himself as staff officer candidate by attending several schools and courses and has been serving as petty officer first class on a coastal defense ship for many years.

Proof of our army's nature is the worker's son Bernhard Klaus, who was born in 1956, graduated from the Air Force Air Defense Officers Academy in 1978 and became an operational officer, who attended the Soviet "Yuriy Gagarin" Air Force Academy from 1981 to 1985, and who today is captain and chief of staff of a fighter wing.

Proof of our army's nature is the 48-year-old Colonel Juergen Schlase, a trained milling worker, who in 1955 followed the party's call to the armed organs, became an officer in 1958, later attended the military academy of the Soviet Army's artillery, and has been leading a missile brigade of the ground forces since 1980.

Proof of our army's nature is former shoemaker and tractor driver and today 52-year-old Major General Hans Unterdoerfel, who in 1954 became an officer and platoon leader of the Garrisoned People's Police, began his career in the NVA as a company commander, in 1962 graduated from the Academy for Soviet Tank Troops and in 1978 from the Academy of the General Staff of the USSR Armed Forces, and who has commanded a motorized rifle division for 4 years.

All these comrades and their fellow strugglers, their superiors and subordinates, the active and reserve members of the NVA must be given credit for the fact that our armed forces have at any time honorably discharged their peace mission. Side by side with the Soviet comrades and with all other socialist comrades in arms, they have been able to effectively help peace to prevail in Europe for more than 40 years.

While the past few decades have ever so often been linked with hardships and stress, with personal privations and many denials for the individual, what does all this count compared with peaceful life in our country in which everybody can feel secure and safe!

This is a country which not only ranks among the first 10 industrial nations of the world, but where the working people's accomplishments also benefit them and their families, a country which is distinguished by social security and social advancement, by a meaningful present and even more beautiful propsects for the entire people.

We are defending a social system without people who are jobless or homeless, without company bankruptcies and the closing down of enterprises, without cuts in social benefits and exorbitant rents!

We are defending a country in which 2.4 million apartments were either built from scratch or modernized since the Eighth Party Congress alone and in which more than 1 million such apartments will be commissioned in the coming 5 years. We are defending a state from whose budget year after year billions of marks are spent on slots in nurseries and kindergartens, class rooms and school gynmasiums, on the health service, on recreation and education for the working people and their families!

What do the gruelling night in the ready alert system on a coastal protection ship in a stormy sea, on a patrol tower in the icy cold or in a radar station in stuffy heat, in the cockpit of a supersonic fighter plane or between the rumbling steel walls of a tank count compared with the carefree laughter of our children, the happiness of our mothers, the labor of our working people in towns and villages which is yielding rich fruit!

Guard Mankind from the Scourge of War

Regardless of what combat sector the NVA members and civilian employees might be employed in, all their thoughts and actions are determined by one great goal to do all they can to guard mankind from the scourge of a devastating war.

I well know that I am expressing the heartfelt thoughts of all NVA members when I reaffirm, on the 30th anniversary, the irrevocable will to defend peace as the primary human right, a will which our Army General Heinz Hoffmann expressed at the 10th SED Congress, stating that "because we want our daughters and sons, our grandchildren and great grandchildren to grow up in good health, because we want to enable them to work for human progress and for their happiness, we do not spare ourselves when the preservation of peace, the supreme asset of the working man, is at stake."

Therefore, dear comrades and friends, we will leave nothing undone to always maintain the combat readiness of our armed forces at the required level. We are mounting guard over the protection of the creative work of our people in further fashioning the developed socialist society, mounting guard over the GDR as the bulwark of peace in the heart of Europe. It is for this that we are standing up with our honor as socialist soldiers and with our lives.

POREBSKI EXPLAINS NEW SCIENCE, TECHNOLOGY COUNCIL

AU131144 Warsaw RZCZPOSPOLITA in Polish 7 Feb 86 p 5

[Interview given by Tadeusz Porebski, PZPR Politburo member and Central Committee secretary, to J. Korzeniowska-Krasowska: Date and place not given]

[Excerpts] The inaugural meeting of the Council for the Advancement and Application of Science and Technology took place in January this year. The council was formed on the initiative of the PZPR Central Committee Politburo for the purpose of stepping up party activities aimed at raising scientific efficiency and accelerating technological progress. We asked the chairman of the council, Tadeusz Porebski, PZPR Politburo member and Central Committee secretary, to discuss this subject with us.

[Korzeniowska-Krasowska] The decision to form the council shows that scientific and technological progress is accorded a very important place in our country at the present time. Nevertheless, one is inclined to wonder whether the formation of the council means that we are dealing with a case of responsibilities and work [being] duplicated, bearing in mind the existence of the Commiteee for Science and Technological Progress attached to the Council of Ministers and the Office for the Advancement and Application of Science and Technology. Is this so?

[Porebsci] We were aware of this aspect when we set up the council and so we planned the work of the council in a way that would prevent such a situation from arising. The composition of the membership of our council is different from that of the committee. We worked on the assumption that it ought to be made up of different people. Thought on the subject of scientific and technological progress should be enriched by the fact that a broader circle of qualified people will be involved in conducting evaluations and developing ideas. The first meeting of the council was rather unusual, discussion was of general kind, and flowed from the question put before the members of the council, which was how do the members of the council see the council's work bearing in mind that committee is attached to the party Central Committee. It gives me great satisfaction to be able to say that the discussion was very fruitful and produced very many interesting ideas. Many ideas of activity were pointed out which confirm that there is not the slightest danger that the council will duplicate the work of the Committee for Science and Technological Progress or the Office for the Advancement and Application of Science and Technology.

The council is not a large one, it has 20 members and will stay that size, although that does not mean that in conducting our work we will not ask for the assistance of other people who are concerned with issues pertaining to scientific and technological progress.

[Korzeniowska-Krasowska] A large part of the resolution adopted at the Ninth Extraordinary PZPR Congress was devoted to science and technological progress and the strategic directions of activity were set out. What progress is being made in the realization of the decisions contained in the resolution? This is another area of state policy which will be assessed during the 10th Party Congress.

[Porebski] I would like to view the matter in broader terms. The subject of scientific and technological progress has been raised and discussed at many earlier party congresses. If one wishes to focus attention on recent years one has to say that our economic difficulties did not permit us to allocate adequate resources for scientific and technological progress which meant that we could not put our ideas on scientific and technological progress in the long-term into practice. The mass of problems we faced, especially economic ones, had to be given priority and there were, therefore, more immediate tasks which had to be formulated and solved. As the economic situation has become more stable during 1984-85, there is a real possibility of undertaking activities in the field of scientific and technological progress, particularly in the formulation of ideas about its functioning.

I personally believe that the decisions adopted at the Ninth Extraordinary Party Congress concerning scientific and technological progress have been realized in their essentials, although with a certain delay; there was no possibility of avoiding that. Undoubtedly, among the most important issues examined at the 10th PZPR Congress will be that of scientific and technological progress and it will occupy, as one would expect, an important place in such congress documents as the congress resolution and the party program.

NEW APPOINTMENTS FROM NAVAL MILITARY COUNCIL

AU260904 Warsaw ZOLNIERZ WOLNOSCI in Polish 14 Feb 86 p 1

[Lieutenant Commander Jozef Wasilewski report: "The PPR Naval Military Council in Session"]

[Text] The 13 February session of the Naval Military Council was attended by Army General Florian Siwinki, PZPR Politburo candidate member and minister of national defense and by General of Division Tadeusz Szacilo, head of the Main Political Administration of the Polish Armed Forces.

On behalf of Army General Wojciech Jaruzelski, chairman of the National Defense Committee, and on his own behalf, F. Siwicki offered cordial thanks to Admiral Ludwik Janczyszyn for his long, highly effective, and dedicated service as commander in chief of the Polish Navy. L. Janczyszyn has been transferred to another state post, and Vice Admiral Piotr Kolodziejczyk has been appointed commander in chief of the navy.

The Naval Military Council was also informed that Vice Admiral Ludwik Dutkowski, deputy commander of the Polish Navy for political affairs, had been appointed to the post of first deputy head of the Main Political Administration of the Polish Armed Forces and that Commander Waldemar Raczkowski had been appointed head of the Main Political Administration of the navy.

To end the session, F. Siwicki discussed the basic training and educational tasks of the navy against the background of the country's internal and international situation.

GDANSK AKTIVS VIEW 'SOCIAL WRONGDOING'

AU190936 Warsaw TRYBUNA LUDU in Polish 15-16 Feb 86 pp 1, 2

[Excerpts] PAP--Gdansk voivodship aktivs held in Gdansk a session on how to combat all wrongdoing that violates norms of people-to-people relations, how to deal with social misconduct, and what to do to improve people's moral health.

The session was attended by representatives of the party, the allied political parties, and social organizations as well as by Stanislaw Bejger, PZPR Politburo candidate member and first secretary of the Gdansk Committee; by Central Committee Secretary Jozef Baryla; and by General Prosecutor Jozef Zyta.

Opening the session, S. Bejger said that the issues of the session are the central problems and of all people as attested to by the Sejm election campaign and by the meetings preceding the 10th Party Congress. What we should do, however, he said, is to take resolute action and, especially, to launch a determined struggle against the features and sources of social ills.

Mieczyslaw Chabowski, secretary of the Gdansk Committee, read a report on dangers to society. Those taking the floor analyzed at length features such as crime, alcoholism, drug addiction, parasitism, waste, and moral corruption of young people.

Speaking at the conclusion of the session, J. Baryla said that the party and state authorities continued to give priority to combating social wrongdoing and promoting moral health for two main reasons:

--First, this is what the people want, and people's wishes should be respected;

--Second, we are entering a new stage of normalization--a stage of disappearing tensions and increasing national agreement, which is necessary if we are to effectively combat social ills. Actually, it can be said that economic improvements depend to a great extent on improvements in people's moral health.

Activities to this end, J. Baryla said, call for unifying various large focus of society, which is a task for men and women of action, goodwill, and care for the community. As for administrative and legal action, we can already see obvious militancy and better results in this regard. On the other hand, we need to boost our efforts at the broad social and educational front. He stressed that what is needed is not a single campaign, but continuous long-term activities, which actually began many years ago. However, this continuation has reached a new stage, one that seeks to find better solutions on the basis of new experience and changing needs.

The session adopted a resolution and addressed an appeal to Gdansk people.

BARYLA AT ELTRA WORKS IN BYDGOSZCZ

LD181000 Bydgoszcz Domestic Service in Polish 1605 GMT 17 Feb 86

[Unidentified correspondent's report]

[Excerpts] At 3:30 pm, in the administration building of the Eltra (radio and TV equipment) Works in Bydogoszcz, a meeting began between the works aktiv and Jozef Baryla, secretary of the party Central Committee and Sejm deputy. The guests of the Eltra workforce also include General of Division Czubinski, deputy internal affairs minister; Zenon Zmudzinski, first secretary of the party Voivodship Committee in Bydogoszcz; and (Ryszard Bandoszek), first secretary of the party Municipal Committee.

The chairman of the meeting stressed in his introduction that the phenomena of social pathology, of which one source was the relaxation of social and professional discipline at the beginning of the eighties, also concern the Eltra workforce. Last year a record number of dishonest employees were recorded here, people who took from the enterprise sought-after stereo radio equipment. It was also last year that a growth was observed in the numbers of those who committed misdemeanors against the law on upbringing in sobriety. Countering these trends and developing a social climate of condemnation for manifestations of hooliganism, vandalism, drunkenness and dishonesty constitute a program for the moral renewal of the community, which we must work out together, and put into practice--said secretary of the Central Committee Jozef Baryla.

Just now, as I dispatch this report, the discussion is still in progress. Afterwards Jozef Baryla, secretary of the party Central Committee, will take part in a meeting of the Eltra departmental party organization at the Mechanical Department which he has applied to join.

Also today in Bydgoszcz a meeting took place between deputy internal affairs minister, Lieutenant General Lucjan Czubinski, and representatives of the civic militia, the Prosecutor's Office, the courts, the penal establishments, as well as members of the misdemeanor courts. At the meeting the functioning of the laws on the accelerated mode of penal proceedings was discussed. It was also stated that problems of broadly conceived legal culture ought to become a subject of discussion in various social milieux.

FOREIGN MINISTER ADDRESSES 'CHILDREN'S FRIENDS' GROUP

AU260900 Warsaw TRYBUNA LUDU in Polish 18 Feb 86 p 2

[Excerpts] Marian Orzechowski, foreign minister and chairman of the Polish Committee of the International Peace Year, received a group of participants in the International Meeting of Children's Friends on 17 February. The meeting, which opens on 18 February in Warsaw, is a function of the International Peace Year proclaimed by the United Nations.

M. Orzechowski drew attention to the dangers to international peace and security and to the need for mobilizing world public opinion to combat these dangers. Recalling the purpose of the meeting of children's friends, he said that it was necessary to make nations realize what disasters wars bring on children and to intensify efforts to preserve peace for the sake of children and their right to live in peace.

Proclamation of 1986 as the international peace year, M. Orzechowski continued, eloquently attests to the universal conviction that effectively combating dangers to peace in the nuclear era calls for consistent and persevering activities by the states and governments and for efforts to jolt world public opinion, including scientific communities, creators of culture and art, as well as social, trade union, religious, and youth organizations and movements.

It is needless, M. Orzechowski stressed, to explain why you came to Warsaw. You have come here to ensure for children a secure future, the most extensive care, education, a healthy and full development, and which is most important, a life in peace. Your motives are close and clear to us. After all, children have always been exposed to the direct dangers during wars and natural disasters. Children's lives, health, and happiness must be regarded as the supreme good of every society if it is to develop normally. But we must always bear in mind that all this is possible only under conditions of peace and international understanding and cooperation. I suppose, M. Orzechowski said in conclusion, that it is the Polish people who are in the best position to value these blessings because they lost over 6 million citizens, including about 2 million children, in the last war.

COMMITTEE APPEALS FOR GOMULKA MANUSCRIPTS

AU251621 Warsaw TRYBUNA LUDU in Polish 19 Feb 86 p 2

["Communique by the Editorial Committee for Planning an Edition of W. Gomulka's Writings"]

[Text] The PZPR Central Committee Politburo, wishing to perpetuate the memory of Wladyslaw Gomulka's distinguished role in the Polish workers' movement and in the emergence and development of People's Poland, has decided to publish his writings. For this purpose an Editorial Committee has been appointed which has already commenced work. At the present state of its work it wishes to determine the full extent of his heritage of writings.

The committee asks all persons and institutions possessing manuscripts by Wladyslaw Gomulka--speeches, letters, notes, and other texts, as well as photographs--to send them to the PZPR Central Committee Central Archives (Warsaw, 13 Gornoslaska Street, telephone 28-60-95 or 29-83-81). This material will be photocopied for editorial and storage purposes and the originals will be returned to their owners.

The Editorial Committee will be grateful for a positive attitude toward its request and gives thanks in advance for the help given to it. The Editorial Committee for Planning an Edition of Wladyslaw Gomulka's Writings.

PAPER REVIEWS MILITIA RESERVE'S 40TH ANNIVERSARY

AU251807 Warsaw TRYBUNA LUDU in Polish 21 Feb 86 p 3

[Jerzy Olszewski article: "Forty Years in the Service of Society"]

[Text] On 21 February 1946, 40 years ago, the Voluntary Citizens Militia Reserve [ORMO] was founded. To be more precise, on that day the Council of Ministers adopted the appropriate resolution, but ORMO units emerged earlier, during the war.

Voluntary groups formed themselves in areas liberated from occupation. They were inspired by the Polish Workers Party, which called on peasants, workers, and the intelligentsia to provide able-bodies and bold people to keep the peace, protect the life and property of citizens, and introduce social order to industrial plants, steelworks, coalmines, and the frequently depopulated cities and villages. But this was not their only task.

The beginning, as well as the first years of ORMO's official existence, were also a sharp struggle against an underground that was hostile to socialism, a struggle during which many lost their lives or health. In the middle of 1946 ORMO membership amounted to 40,000, but was already over 100,000 at the beginning of 1947. These members, together with functionaries of the Citizens Militia and Security Service, became soldiers of the Polish People's Army, guarding the emerging socialist state.

When it was obvious that the state had taken root and that strong organizational structures for people's rule had emerged, and when the opponents to the new system had had their weapon knocked out of their hands, meaning real rifles and pistols, the tasks of the ORMO organizations changed. A new statute issued by the minister of internal affairs altered the unit's paramilitary nature that had been in effect till then. ORMO became a social organization, whose basic duty since then has been to conduct preventive and educational activity, as well as to guard public property and economic and natural assets, and maintain order in the streets of cities and villages and in production plants.

Later, the PPR Sejm passed a law which stipulated the structure and nature of ORMO.

Today, ORMO's membership exceeds 300,000. People have remained in the organization who are profoundly ideological, compeltely dedicated to their work, and convinced as to its correctness and necessity. Such a selection of people has not turned out to ORMO's disadvantage because the weakest people and those who are unstable and nonresilient have left it. Some former members are once again applying to join, or rather to return to the units where they once worked.

Not so long ago I looked at the work of ORMO teams in large plants in Silesia--in mines and steelworks. Not many functionaries resigned in those places at the beginning of the 1980's. People possessing a workers' background are tough, resilient, and not susceptible to changing moods. They continue to patrol their plants just as they have always done; make daily rounds; and point out disorder, untidiness, and waste of machinery, equipment, raw materials, commodities, and energy. Their work serves to visibly improve the production figures of enterprises.

ORMO men cooperate closely with the industrial watch and with professional control bodies. Wherever this cooperation is in order, cases of drinking liquor during work or violating other legal rules in force inside workplaces are either absent or exceedingly rare. ORMO's cooperation with the Militia and Railroad Protection Service is very favorable. Until recently, very evil things, even shocking ones, used to occur. Wagons were quite simply stolen and valuable goods carried away. Now the situation has clearly improved, and a lot of this is the work of ORMO teams patrolling stations and railroad sidings, and controlling trains on the move.

The years of sociopolitical unrest have strongly weakened the moral health of some sectors of our nation. We know that there is no universal body combatting wrongdoing. It is necessary to create a broad front of social disapproval, a front of moral renewal. It is in this very front that an above-average role may be played, and in fact is being played, by ORMO, which has written so many beautiful pages in its 40-year history.

JARUZELSKI RECEIVES DKP DELEGATION

AU250544 Warsaw TRYBUNA LUDU in Polish 22-23 Feb 86 p 1

[Text] PAP--On 21 February PZPR First Secretary Wojciech Jaruzelski received a DKP delegation led by Karl Heinz Schroeder, Presidium member and board secretary of the DKP.

W. Jaruzelski discussed Poland's situation and 10th Congress preparations and K.H. Schroeder reviewed DKP activities in the struggle for peace and the working people's rights in the FRG as well as the course of party discussions prior to the Eighth DKP Congress.

The sides agreed that the most important present task of all progressive and democratic forces is to struggle against the danger of nuclear annihilation and to support all initiatives to promote this struggle. In this connection they approved of M. Gorbachev's proposals that nuclear weapons should be eliminated by the end of this century.

The PZPR and the DKP view with concern the activization of the revanchist forces in the FRG, which continue to question the territorial-political reality in Europe. It is necessary to oppose such activities.

The two parties will continue to develop their fraternal cooperation.

The meeting, which took place in a cordial atmosphere, was attended by Ernest Kucza, head of the Central Committee Foreign Department.

PZPR LAW, ORDER COMMISSION IN SESSION

AU250544 Warsaw TRYBUNA LUDU in Polish 22-23 Feb 86 p 2

[Jerzy A. Salecki report: "Developing Attitudes Is a Common Task"]

[Text] The 21 February session of the PZPR Law and Order Comission discussed the party program for developing civic attitudes, consolidating moral values, and combatting wrongdoing in 1986-90. The session was chaired by Central Committee Secretary Jozef Baryla, the commission's new chairman.

The session analyzed the party program's commitment to ensure that citizens respect and observe the values of socialist humanism and that wrongdoing is eliminated from public life. It stressed that the comprehensive nature of the program makes it necessary to promote a national struggle against wrongdoing in any form and that the party, which coordinates the allround process of renewal, continues to respond to people's demands that efforts to overcome the crisis must not be restricted to economic problems alone because there is also an acute crisis of human behavior and because reprehensible and criminal phenomena continue to be tolerated.

The party program for fostering civic attitudes is a continuation of the Ninth Party Congress tasks and reflects social needs and expectations. That is why its tasks can and should be tackled by various social organizations and educational institutions.

The session stressed the need for an extensive struggle for the morale of our people and against various features of wrongdoing and agreed that parents, school, youth organizations, local self-government groups, and enterprises must have their place in this struggle. The session drew special attention to the responsibility of enterprise managements for educating new cadres, for fostering correct people-to-people relations, and for combatting alcoholism and refusal to work and indicated that the social efforts to develop civic attitudes must be aided by the law, which should be applied with justice and the necessary severity.

The session agreed that unreasonable tolerance of wrongdoing makes the criminal fringe even more impudent and undermines people's trust in the authorities. The important task is to create a climate that encourages the people to actively combat wrongdoing and that totally condemns alcoholism, dishonesty, loitering, as well as common and economic crimes.

The struggle for the people's moral health is one of the elements of the 10th Party Congress preparations, J. Baryla said. By presenting the long-term program for civic upbringing, we want to foster socialist ideals, strengthen respect for work, and eliminate wrongdoing from our community life. The party sponsors activities to this effect, but all party members and nonparty people must support these activities for national reasons. The document that this commission will draw up will be represented to the party leadership.

The session also discussed the performance of the Worker-Peasant Inspectorates in 1985 on the strength of an analytical report submitted by the Social-Legal Department of the Central Committee.

OLIWA SPEECH ON SOVIET ARMY ANNIVERSARY

AU261516 Warsaw ZOLNIERZ WOLNOSCI in Polish 22-23 Feb 86 p 2

[Speech by General of Division Wlodzimierz Oliwa, deputy minister of national defense and chief quartermaster of the Polish Army; at a concert held at the Polish Theater in Warsaw on 21 February to mark the 68th anniversary of the formation of the Soviet Armed Forces]

[Excerpts] This year we are celebrating Soviet Comrades-in-Arms Day in a particularly elevated atmosphere. This atmosphere is generated by the preparations which are being made for the 27th CPSU Congress, whose historic deliberations will commence in a few days' time. The congress will be an event of the highest order, whose singificance will extend beyond the borders of the Soviet Union. These pre-congress days are accompanied by thoughts on the great achievements of the Soviet people since the Great October Revolution, and by thoughts on the inspiring and stimulating program whose implementation will raise the Soviet Union to a qualitatively new level of sociopolitical and economic development and will lead it along the wide road leading to a communist society.

Life in peace continues to be subjected to a harsh test. In recent years, mankind has once again found itself in a critical situation. The confrontational policy being pursued by the United States and the majority of its NATO allies is the force that is pushing the world toward a nuclear catastrophe. The intensification of the arms race, the realization of the "Strategic Defense Initiative"--the "Star Wars" program to call it by its name--is the most telling manifestation of this tendency. This has resulted in a dangerous deterioration in relations between East and West. It is a threat to all mankind.

This policy is aimed at producing a change--to the benefit of the West--in the existing balance of power between the United States and the Soviet Union, and the North Atlantic Alliance and the Warsaw Pact. A whole complex of military, economic, political, and propaganda undertakings have been subordinated to this end.

The Soviet Union leaves no doubt that all attempts at achieving superiority over our defensive coalition will be thwarted in good time. At the same time the Soviet Union, supported by the socialist states, continues to undertake peaceful activities aimed at creating confidence and security in Europe, at curtailing the arms race, at stabilizing and laying a firm foundation for military equilibrium, and at achieving a consistent reduction in the danger threshold.

The most recent and clear evidence of this is the initiative announced by the General Secretary of the CPSU Central Committee, Mikhail Gorbachev. He has put forward a comprehensive program for greeting the 21st Century without nuclear and chemical weapons and with a far-reaching reduction in conventional weapons. The philosophy behind this program--which convinces hearts and minds with its simplicity, logicality, and its resoluteness--can be expressed in one sentence: Let us not seek weapons that are more powerful then those we already have, and seek to protect ourselves against their use; let us destroy them now and live in peace.

The Soviet program for total disarmament has set out, in a concrete and factual manner, the path leading to mankind's liberation from the nuclear threat. It is of historic significance for the disarmament dialogue between the Soviet Union and the United States and for the negotiations which are taking place between East and West in various forums. The document creates hope that lasting peace will become a real possibility.

On the other hand, so far it has not met with an appropriate response in the United States.

As General W. Jaruzelski, PZPR first secretary, declared from the tribune of the United Nations, Poland is and will remain an ardent advocate of peace and international security. We gave expression to this by supporting the idea of a meeting between the leaders of the Soviet Union and the United States in Geneva. We support the Soviet program for the elimination of weapons of mass destruction.

Our efforts to strengthen peace and international security occupy a prominent place in the PZPR draft program and manifest themselves in the pre-congress discussion which is currently under way.

The soldiers of the Polish People's Army, along with all society, are actively participating in setting out the paths for the development of socialist Poland. They are defining their responsibilities toward their own country and toward the entire socialist community.

ROLE OF BASIC PARTY ORGANIZATIONS VIEWED

AU272118 Warsaw ZYCIE WARSZAWY in Polish 24 Feb 86 p 2

[Discussion of report prepared by the executive of the Warsaw Voivodship PZPR Committee and presented at a conference of basic party organization first secretaries held in Warsaw on 22 February]

[Excerpts] Primary party organizations must be deeply rooted in their communities, they must be familiar with the problems faced in their communities, and know what concerns people most of all. These were the dominant themes of the report which served as a starting point for discussion.

The report concentrated on the following issues:

--How can the Warsaw party organization be strengthened, and how can its influence be increased and its ability to lead and direct the political, social, and economic life of the capital enhanced;

--How to form the closest possible bond between the party and workers' class and its aspirations and interests;

--How to improve the manner in which the ideals of the party are conveyed to the younger generation.

--What has to be done to party work to bring about an improvement in the execution of economic tasks and to raise effectiveness in the solution of the most urgent problems faced by working people.

Of course, the answers are neither simple nor straightforward. These questions were inserted into the report on the assumption that participants in the meeting would voice opinions on them and make observations. The concrete facts, figures, and proposals contained in the report were to serve as the starting point for discussion and generalization.

Here are some examples:

The Warsaw PZPR organization has more than 137,000 party members and candidate members who are grouped together in more than 3,000 primary party organizations. Last year 3,000 candidate members were admitted into the party (1,000 more over

1984), but only 785 primary party organizations were involved in their recruitment. There are party organizations--and some are in workplaces that are far from small--which did not admit a single candidate during this period. The number of workers in the party--we read in the report--is also unsatisfactory. Even in such typically workers' districts as Wola and southern and northern Praga, workers comprise only 25-35 percent of those admitted into the party as candidate members. The report provides examples of active party organizations and of party organizations whose work leaves a lot to be desired. An obvious conclusion can be drawn from this--building the party must be the concern of all its members. The report also draws attention to individual party tasks and to the work of party groups whose activeness has declined somewhat.

In the section of the report dealing with trade unions, it is stressed that party members comprise barely 60 percent of union membership in the voivodship. The presence of party members in the trade union movement should--stresses the report--provide confirmation of the continuity of the party line with regard to trade unions, which is that the party is an ally and partner of the trade union movement in the struggle to satisfy the needs of working people and that it defends the independence of the movement and adherence to the principle of self-government.

Much space in the report was devoted to living and working conditions in the city and voivodship. The attention of the capital's political and administrative political authorities always has been and always will be focused on finding ways of improving these conditions. Nevertheless, there is a need for a further definite improvement to be made to the situation. Improvements are needed in the operation of all the services provided by the city: transportation, the supply of water, the provision of heating, trade, public order, and medical care, education, and culture.

Despite the selflessness displayed by a certain section of the employees working in these areas of the city's life, the quality of their work continues to arouse public criticism. Undoubtedly one cause of this criticism is the progressive decline in the condition of municipal facilities. But one also knows of cases of a lack of responsibility on the part of representatives of the administration and management cadres who run public services creating additional difficulties in the living conditions of the city's inhabitants, who are already wearied by the difficulties they encounter in everyday life. Those who are guilty of such actions are frequently castigated publicly but what do party organizations do in these instances? After all, party organizations should assess the quality of work in its undertakings for the good of the city in daily practice, and they should, above all, take stock of their activities in this field and be judged by party cells.

The report also sets out the key socioeconomic issues for the capital and voivodship over the coming years. These include:

--Ensuring that the necessary technical conditions exist for the proper functioning of the agglomeration, entails solving problems connected with the water supply, the construction of sewers, the expansion of the trade and services infrastructure (including the construction of a bakery).

--Improving housing conditions and the supply of essential services in residential areas.

--Creating an efficient public transportation system; this entails the construction of the first stage of the metro, and the expansion of the bus, tram, and trolley-bus networks.

--Developing the production base for agriculture and the food industry in order to improve the supply of foodstuffs to the population.

The report also stresses the role and tasks of the Warsaw party organization during the period of preparations for the 10th PZPR Congress. It is a matter of great importance to promote widespread interest in the contents of the party program and the issues that will be raised at the congress.

POLITICS POLAND

JARUZELSKI, GROMYKO EXCHANGE AWARD SPEECHES

AU041449 Warsaw TRYBUNA LUDU in Polish 28 Feb 86 pp 1, 3

[Exchange of speeches by PZPR First Secretary Wojciech Jaruzelski and USSR Supreme Soviet Presidium Chairman Andrey Gromyko during the 27 February presentation of the Grand Cross of the Order of Polonia Restituta to the latter at the Polish Embassy in Moscow]

[Text] W. Jaruzelski: Comrade Gromyko, you have been an active participant in the construction of the postwar territorial and political order in Europe and an architect of a phase of peaceful coexistence. You were in Yalta, Potsdam, and San Francisco. In those distant days, which always seem not very far from us, you conceived a cordial and far-reaching attitude toward Polish affairs and toward socialist snd sovereign Poland's territorial integrity. Bearing in mind the struggles and sufferings of the European peoples, you have always opposed consistently and resolutely any attempt to undermine the World War II results, for which the Soviet and Polish people paid such an incalculable price.

On behalf of the PZPR Central Committee and PPR highest authorities, W. Jaruzelski extended to A. Gromyko expressions of great esteem and wishes for a long life and fruitful work for the CPSU and the Soviet State and people.

A. Gromyko: Offering his cordial thanks for the honor of the award, A. Gromyko said among other things: The order I have just received is not only a recognition of my modest services, but above all a high evaluation of the policy followed by our Leninist Party and the soviet states, the friendship between our peoples has deep roots. Our common dedication to Marxist Leninism and the unity between the PZPR and the CPSU as well as between the USSR and People's Poland on international questions is a guarantee that this friendship will continue to intensify.

A. Gromyko also stressed the importance of Poland's support for the Soviet Union's peace initiatives. Our country highly values Poland's activities to strengthen the Warsaw Pact and its contribution to the coordinated foreign policy of the fraternal countries and to our common struggle for the peace and security of nations, he said.

U.S., SOUTH KOREAN MANEUVERS VIEWED AS THREAT

AU031153 Warsaw ZOLNIERZ WOLNOSCI in Polish 1-2 Mar 86 p 7

[Major Jerzy Markowski: "Maneuvers of Anxiety"]

[Text] For many years the Korean Peninsula has been an arena of confrontation and an exceptionally volatile hotbed of war, posing the danger of a hecatomb which would involve at least the region. The dangerous "war games" that have been held in an American-South Korean version since 10 February clearly show who is in favor of escalating warlike measures in this part of the world. The maneuvers codenamed "Team Spirit-86," for these are the subject, are causing not only anxiety but also a real threat.

For let us realize that over 200,000 crack soldiers have been billeted in a realtively small area, whereas the bloody aggression against the North in June 1950 was started with only half this number of soldiers. The organizers of this military demonstration in Seoul and Washington are making no effort to hide the fact that the exercises possess a clearly offensive nature, aimed at the DPRK. After all, it is difficult to conceal the types of forces participating in the maneuvers and using the most modern military materiel designed to wage nuclear war. Parachute descents, the overcoming of water obstacles, activity by special units--these are only some of the features of this year's extensive "Team Spirit" scenario. The aircraft carrier "Enterprise," flagship of the U.S. 7th Fleet; F-15 and F-16 aircraft capable of carrying nuclear weapons; various kinds of tactical missiles; howitzers; and M-60 tanks;--this is the materiel being used in the war rehearsals.

In addition, the Americans are moving to the Korean Peninsual the Third Marine Division from Okinawa, the 7th Infantry Division from California, and the 25th Division permanently based in Hawaii. It is not by coincidence that these units have been chosen. After all, former soldiers belonging to them "distinguished" themselves in the terrible Korean War in 1950. Can it be that their successors are being prepared to continue their work? It looks like it, especially because the scenario of the exercises foresees a forcing of the demarcation line and an advance on the North. Most of the units have also been deployed along the 38th parallel. The flagship of the 7th Fleet, from which the maneuvers are being directed, has been anchored in Inchon, which was also a strategic point in the last war. This, together with the deployment of combat aircraft from the 8th and 18th Tactical Air Squadrons or the 376th Squadron, has been carefuly planned. There is no question of routine training. Instead, the soldiers are being shown the real conditions of the sites of potential combat operations.

General Wheecham, one time chief of the General Staff of the American land forces, once said that the "Team Spirit" maneuvers have shown that one can wage an undeclared war in Korea. Are this year's maneuvers meant to confirm and perpetuate this view? Everything indicates that the answer is yes, because every year the "Team Spirit" maneuvers are being perfected with this objective in mind. If there were 46,000 people taking part in the first of these series of exercises in 1976, today that figure is already over 200,000.

"Team Spirit-86" is also different from past exercises because of the size of operations, the types of weapons used, tactical objectives, and the location of combat areas directly near the fragile demarcation line. During the past 2 weeks, U.S. reconnaissance aircraft have violated DPRK airspace as much as 19 times. I do not suppose anyone needs convincing as to the possible outcome of such incidents when, at the same time, there is a 200,000-strong army concentrated in the starting positions of the "Team Spirit" maneuvers.

In the light of this, one can quite understand the DPRK's protests and aims to stop these maneuvers of anxiety which are causing a further growth in tension, enhancing a lack of confidence, and torpedoing the possibilities of peaceful dialogue in this part of the world. Pyongyang's peace efforts have encountered support from the whole of the world's progressive public opinion. The DPRK's statement on halting all military maneuvers and exercises on its territory as of 1 February has met with clear apporval. This was not merely a gesture of good will, but a constructive basis on which to build the structure of peace and security, if only the United States and South Korea follow this example. The "Team Spirit" maneuvers have buried these hopes. And all the responsibility for the antipeace activities in the Korean Peninsula and for escalating tension and war preparations falls on the shoulders of the organizers of these maneuvers. For any objectively thinking person will notice in whose interests it lies to maintain a dangerous hotbed of tension and exacerbate it. The "Team Spirit-86" maneuvers do not serve a good cause. Instead they serve hegemonistic U.S. goals, the perpetuation of the U.S. presence in this region, and the continuation of destabilization. The Korean War and aggression against the DPRK 36 years ago were also preceded by make-believe manuevers....

MESSNER MEETS LEGISLATIVE COUNCIL OFFICIALS

LD072158 Warsaw PAP in English 2017 GMT 7 Mar 86

[Text] Warsaw, 7 March--Prime Minister Zbigniew Messner met today with members of the Presidium of the Legislative Council who conveyed to him a report on the state of law.

The Legislative Council is a social advisory body [word indistinct] the prime minister which groups 40 eminent lawyers and cooperates with 60 scientists representing all university centres in Poland.

The 200-page report, and 7 volumes devoted to the separate domains of law which accompany it, have been prepared by the Legislative Council over the past 18 months and contains synthetic information about the state of the currently binding law and formulates directions of its improvement.

Thanking the Legislative Council's Presidium for the work on the report, the prime minister stressed [words indistinct] very helpful in preparing the government's programme of legislative work for the near and more distant future.

Premier Messner also thanked Professor Zylwester Zawadzki, the hitherto chairman of the Legislative Council who resigned because of his nomination to the Council of State, for his work, and handed the nomination act to the council's new Chairman Professor Zbigniew Radwanski of the Adam Mickiewicz University in Posnan.

PZPR PROVINCIAL, REGIONAL COMMITTEES MEET

Krosno Plenum on Agricultural Needs

Warsaw RZECZPOSPOLITA in Polish 13 Dec 85 p 2

[Text] The PZPR KW Plenum held on 12 December in Krosno was devoted to an assessment of the current situation in agriculture and the food economy in Krosno Province in light of the resolutions of the 11th PZPR CC and ZSL NK Plenum.

It was determined that in order to achieve an increase in farm production in all of its fields, land reclamation must continue, agricultural and rural water supply must improve and better living conditions must be created for rural communities through the development of health clinics and the educational-cultural and sports-recreational base.

Chelm Plenum on Party Organization

Warsaw RZECZPOSPOLITA in Polish 13 Dec 85 p 2

[Text] The PZPR KW Plenum held on 12 December in Chelm was devoted to an examination of the major directions of socioeconomic development from 1986 through 1990 and to the specification of the tasks of party echelons and organizations in implementing these directions of development.

The resolution that was passed binds party echelons and organizations to inspire and create a broad social front for implementing the tasks of the next five-year plan.

Lublin Plenum on Ideology

Warsaw TRYBUNA LUDU in Polish 16 Dec 85 p 2

[Article by Ryszard Wolak; first paragraph is TRYBUNA LUDU introduction]

[Excerpts] (Own Information) In spite of the fact that the plenary meeting of the PZPR Provincial Committee in Lublin that took place on 14 December under the chairmanship of KW Secretary Tadeusz Borszynski was to be fairly limited in subject matter due to the 30th anniversary of the Lublin WUML, it became an opportunity for exchanging views on ideological-upbringing issues in general.

It was emphasized during the deliberations that the level and effectiveness of ideological work in each party element has a marked influence on the state of the entire party, on its ideopolitical cohesiveness.

Recently a fundamental current of the ideopolitical and organizational work of the provincial party organization has been related to the PRL Sejm elections campaign.

In assessing the elections as a victory of the front for national understanding, we may note that in the Lublin Province, the Evening University of Marxism-Leninism has played an important part here by contributing to the training of a large group of party activists in youth organizations, political parties and the nonparty aktiv.

During this academic year, in order to prepare the party aktiv for working more effectively during the period preceding the 10th PZPR Congress, Marxism-Leninism study groups have been set up to accompany the many forms of training already in existence. Seventy such groups have begun operation. In this way, the party will contribute to resolving the growing problems facing society and the workers' communities in particular and will gain society's support for its own program. The tendency for more and more workers to enter the PZPR already is evident. In 1984, the POP's accepted 328 workers and 85 peasants, while over the course of 11 months in 1985, they accepted 454 workers and 110 peasants.

In the resolution passed by the KW defining the future tasks of ideological work and in the implementation of the resolutions of the 13th PZPR CC Plenum preceding the 10th Party Congress, it is recognized as necessary to continue to increase the importance of WUML in the system of ideopolitical education, to make better use of its graduates and to improve the operation of the institution so that studies programs and its other forms of operation are related closely to the needs of the practical work of the provincial party organization.

Przemysl Plenum on Training

Warsaw TRYBUNA LUDU in Polish 16 Dec 85 p 2

[Article by Jan Miszczak; first paragraph is TRYBUNA LUDU introduction]

[Excerpts] The PZPR KW Plenum held on 14 December in Przemysl was devoted to party tasks in creating a society-wide front for aiding schools in educating and training young people.

It was noted that the movement for the renewal of our sociopolitical and economic life laid out at the Ninth Party Congress likewise is linked with a new approach to the problems of education and upbringing and to giving them their proper place in the hierarchy of social values.

It was emphasized that the school must be an institution that trains people for life and work, properly developing character and patriotic attitudes.

However, schools continue to battle with many problems that are not merely local in scope. The lack of textbooks is well known; the overly inclusive and difficult program is criticized; the frequent sketchiness of its implementation is viewed negatively since it leaves little time for forming the personality of the student, his moral attitudes, respect for work and the like. The party must help to resolve these growing problems. A program also must be prepared for the secular education of the entire society so that this duty does not fall exclusively upon the school. A proposal was made for creating a PZPR KW team for issues related to layman's affairs.

Siedlce Plenum on Local Party Structure

Warsaw RZECZPOSPOLITA in Polish 17 Dec 85 p 2

[Text] The PZPR KW Plenum held on 16 December in Siedlce was devoted to problems of the effectiveness of the political-organizational activities of the provincial party organization in light of the resolutions of the Ninth PZPR CC Plenum. Participants in the deliberations included: candidate member of the Politburo, PZPR CC Secretary Wlodzimierz Mokrzyszczak and Deputy Prosecutor General Hipolit Starszak.

Gdansk Plenum on Internal Party Structure

Warsaw RZECZPOSPOLITA in Polish 17 Dec 85 p 2

[Text] The assessment of the state of the Gdansk Provincial Party Organization, the definition of tasks for its future development and a discussion of the most important questions of intraparty work at the present time--these were the topics discussed at the PZPR KW Plenum held on 16 December in Gdansk. The deliberations were chaired by Politburo candidate member, PZPR KW First Secretary Stanislaw Bejger.

Kielce Plenum on Ideological Training

Warsaw RZECZPOSPOLITA in Polish 17 Dec 85 p 2

[Text] On 16 December, the provincial party echelon of the Swietokrzyski region held a plenary meeting to assess the ideological work in the Kielce region and the future directions of its development.

Plock PZPR, ZSL Joint Plenum

Warsaw RZECZPOSPOLITA in Polish 17 Dec 85 p 2

[Text] The PZPR and ZSL Provincial Committees in Plock met on 16 December at a joint plenary meeting devoted to the directions of development of the raw materials base and the agricultural-food industry in the region through 1990.

Various Provincial Committees Meet

Warsaw TRYBUNA LUDU in Polish 19 Dec 85 p 1

[Article by: jak]

[Text] (Own Information) On Wednesday, PZPR provincial committees held plenary meetings at Jelenia Gora, Rzeszow, Walbrzych and Wroclaw. On that same day in Sieradz, the PZPR KW and the ZSL WK deliberated at a joint plenum.

--in Jelenia Gora, an assessment was made of the course of the Sejm elections campaign and the implementation of recommendations made by residents of the region at pre-elections meetings;
--in Sieradz, the state of implementation of the resolution of the joint PZPR CC and ZSL NK Plenum was discussed;
--in Rzeszow, the directions of socioeconomic development of the province from 1986-1990 and party tasks in implementing the plan for next year were discussed;
--in Walbrzych, the protection of the natural environment in the province was discussed;
--in Wroclaw, an assessment was made of the implementation of the recommendations of the 16th PZPR CC Plenum.

Konin Plenum Focus on Ideological Work

Warsaw TRYBUNA LUDU in Polish 20 Dec 85 pp 1, 2

[Article by Ryszard Slawinski]

[Text] (Own Information) "Towards the further intensification and expansion of the ideological-upbringing work of the provincial party organization"--this was the subject of the plenary meeting of the Konin PZPR Provincial Committee. The administrators and employees of cultural and educational institutions took part in the deliberations. The meeting was chaired by PZPR KW First Secretary Lech Ciupa.

During the discussion, Andrzej Zjezdzalka from Pyzdry pointed out that we know of circles of people that we can influence ideologically, but there is not a large enough cadre to implement this influence. This shortage is felt especially sharply in rural areas. The speaker spoke with concern of the almost total abandonment of ideological-upbringing work in higher schools.

Tadeusz Sliwinski, director of the Metallurgical Schools Group in Konin, expressed concern regarding the low level of preparedness of teachers conducting classes in sociology, religion and sometimes even history. He noted the activation of church activities among young people. He suggested that young people should be invited more often to the Provincial Committee building for discussion and persuasion purposes. There is just too little contact and conversation going on. Marian Pietraszewski, education and upbringing superintendent, reported that as much as one-third of the teachers in the Konin Province lack professional qualifications. Intensive work is being done with them to improve their professional and ideological qualifications. He said that despite many problems, a unified upbringing front is being rebuilt. Following a period of inactivity, plants are becoming more active in cooperating with the school.

Other speakers also stressed that within the framework of the National School Assistance Action, aid should be given not only in the form of building and expanding the base, but also in the area of developing an upbringing and ideological model of the school.

In the resolution that was passed, the plenum expressed the need for party members and primary party elements to take the offensive in molding pro-socialist attitudes, the need to oppose enemy activities that conflict with the interests of society and the state.

The resolution approved the creation of the PZPR Teaching Community Committee that was established on 14 December 1985.

Committees on Need for Stronger Party

Warsaw TRYBUNA LUDU in Polish 19 Dec 85 p 5

[Text] At the regional center for party work in Otwock, on 18 December, members of the executive boards of PZPR city and city-gmina committees in Otwock, Sulejowek, Wesola, Jozefow, Karczew, Celestynow, Kalinow and Wiazowna gathered together for a meeting. The meeting was devoted to increasing the political-organizational effectiveness of party activities and to preparations for the 10th PZPR Congress in light of the resolutions of the 20th PZPR CC Plenum. During the discussion, major emphasis was placed on the tasks and role of POP's in the plant and in the strengthening of party ranks. The most important problem currently facing plant party echelons was found to be their execution of an assessment of the sociopolitical situation in their own plants.

During the meeting, cooperation between party echelons and trade unions and social organizations, including youth organizations, also was discussed. The latter in particular has not been successful everywhere. This emanates from the weakness of some gmina and city ZSMP elements and from the insufficient commitment of youth to social ends. Therefore, the need for party members to aid ZSMP elements also was emphasized.

PZPR CC Politburo member Albin Siwak, who took part in the meeting, stated that in the current political-economic situation, party members are faced with especially difficult and responsible tasks. He stressed the problems of social justice. He likewise presented problems arising in the work of the health service and housing construction.

Lodz Plenum on Social, Economic Plans

Warsaw TRYBUNA LUDU in Polish 28-29 Dec 85 pp 1, 2

[Article by Jan A. Kraszewski]

[Excerpts] On 27 December, the PZPR Lodz Committee held a plenum commencing extensive social discussion on the assumptions of the provincial socioeconomic plan for 1986.

The deliberations were chaired by CC Politburo member Tadeusz Czechowicz, first secretary of the provincial party echelon. Participants included members of the party team of Lodz People's Council council members and representatives of trade unions.

The discussion opened with an address given by Jaroslaw Pietrzyk, KL secretary. He focused on the most important problems to be resolved during the coming year. These include: housing construction, repairs to old homes managed by municipal authorities and the improvement of the educational and health services base.

Mieczyslaw Berwinski, PRL Sejm deputy and chairman of the Lodz People's Council, stressed the importance of the socialization of the planning process in all fields of social and economic life. With regard to this issue, Comrade Alfred Lutrzykowski expressed his concern over the delayed submission of the draft plans for next year. He said that due to this it is feared that Lodz People's Council council members will not have time to make a thorough analysis of basic documents.

During the second half of the meeting, the PZPR KL Plenum examined organizational matters.

Warsaw Committee, Audit Commission Meet

Warsaw TRYBUNA LUDU in Polish 28-29 Dec 85 p 8

[Text] On 27 December, a joint meeting of the PZPR Warsaw Committee Secretariat and the Warsaw Audit Commission Presidium was held. The deliberations were chaired by KW First Secretary Janusz Kubasiewicz. Kazimierz Morawski, PZPR CKR chairman, took part.

The discussion, that was prefaced by a report of WKR Chairman Ludwik Rzewuski, covered the results of checks and audits made by the WKR in 1985 and the tasks of auditing elements at all levels in 1986. It was stressed that all tasks embarked upon in this period will be part of a massive campaign preceding the coming 10th PZPR Congress for developing ranks and strengthening party elements.

Pila Plenum Notes Increased Party Numbers

Warsaw TRYBUNA LUDU in Polish 30 Dec 85 pp 1, 2

[Article by Wladyslaw Wrzask]

[Text] (Own Information) The plenary meeting of the PZPR Provincial Committee in Pila was devoted to an assessment of the implementation of the resolutions of the Ninth Extraordinary PZPR Congress in the Pila Province and to the tasks of party echelons and organizations in making preparations for the 10th Congress.

The point of departure for discussion in four working groups was the KW executive board report assessing the effectiveness of the work of the provincial party organization during the period following the Ninth Congress. The report also discussed in detail the work of the party throughout 1985, now coming to a close.

Over the course of 11 months in 1985, 797 candidate members were accepted into party ranks in Pila, or 42.2 percent more than during the same period in 1984. The majority of the new members are workers. The activism, the mobility and the scope of the work of primary party elements increased considerably. A vital achievement is the action taken by these elements on the most important issues and problems of the communities in which they operate. Considerable progress likewise was noted during the period in the implementation of party resolutions.

Due to party actions, the elements of authority and all forms of participation of society in exercising authority were strengthened.

The Provincial Committee approved the report that was submitted on the implementation of PZPR Ninth Congress resolutions. All party echelons and organizations were obliged to make a similar assessment and to suggest possible comments, additions and recommendations for the accepted report. The program of work adopted for the near future states that the Pila Provincial Party Organization will embark upon activities slated towards developing party ranks, deepening forms of ideological training and making them more attractive and expanding methods of social consultation.

BRIEFS

GDR UNIONISTS AT 'URSUS'--The following topics were discussed at a meeting of a FDGB delegation from GDR with unionists from the Machinery Plants 'URSUS': participation of workforce in enterprise management and union's actions to improve productivity and working conditions of workforce. Participating in the meeting with the GDR delegation consisting of nine members and led by Harry Tisch, Central Committee SED Politburo member and FDGB Central Board chairman, were Alfred Miodowicz, chairman, OPZZ, Wlodzimierz Lubanski, chairman of the Trade Unions Federation 'Metalowcy' [Metal Workers], and 'URSUS' management. The GDR delegation also met with representatives of the Warsaw Trade Unions League. [Text] [Warsaw ZYCIE WARSZAWY in Polish 29 Nov 85 p 2] 12607/7687

TECHNOLOGY MEETING AT COUNCIL OF MINISTERS--A meeting was held on 28 November 1985 by the Committee for Science and Technology at the Council of Ministers. During the discussion led by Deputy Premier Zbigniew Szalajda, a draft of the 1986-1990 National Socioeconomic Plan was analyzed with respect to its science and technology aspects. A two day plenary meeting of the Main Council of Science and Higher Education was held at the Warsaw Polytechnical School on 28 November 1985, the last in its first term that is ending now. Election of the Council members for the second term was reviewed. The Council refused to support a proposal to offer assistant-professorship to applicants without habilitation. The 7th Conference of the Polish Society for Political Sciences began on November 28, 1985 in Przysiek near Torun. During the opening ceremony, for the first time annual scientific awards for the whole scientific output were granted. The recipients were Professor Arthur Bodnar, Professor Jerzy Muszynski, and Professor Longin Pastusiak. Worth activists of the society were honored with state orders. Among others, Professor Kazimierz Podoski and Dr. Wiktor Pianowski were decorated with the Officer's Cross of the Order of Polonia Restituta and Professor Longin Pastusiak with the Knight's Cross of the Order of Polonia Restituta. JOURNALISTS HOST TALK ON ADDICTION--The number of drug addicts in our country is estimated to be ca. 200,000. The majority of them are under 25. Unfortunately, the number of drug addicts rises. More and more often, children under 10 reach for intoxicants. The results of research done last year among the Warsaw drug population by the Warsaw Office of Internal Affairs were presented in Warsaw at a meeting of journalists and representatives of jurisdiction, health maintenance organizations and organizations combating drug addiction. The meeting was organized by SDPRL's Club of Social and Legal Journalists and editors of the journal CZLOWIEK I SWIATOPOGLAD. Ways of making mass media more effective in the campaign against drug addiction were discussed. [Summary of PAP dispatch] [Text] [Warsaw ZYCIE WARSZAWY in Polish 30 Nov - 1 Dec 85 p 2] 12607/7687

STUDENT MOVEMENT HOSTED IN WROCLAW--The Wroclaw Polytechnical School hosted a jubilee meeting to celebrate the 40th anniversary of the Wroclaw university student movement. Several generations of alumni met who are now professors and outstanding specialists in various spheres of social and economic life. Participating in the meeting was Politburo Member, PZPR Central Committee Secretary Tadeusz Porebski. Fifty-four of the most worthy representatives of several generations of youth organization activists were decorated with golden and silver Janek Krasicki Badges, which were handed by Jerzy Szmajdzinski, chairman of the Main Administration of the Union of Polish Youth.

Present were members of the "Polish Academics Association in Germany". Lutoslawa Malczewska and Adolf Wawrzok were decorated with Golden Badges of Merit for the City of Wroclaw and the Wroclaw Province. Twelve university youth organization activists were handed Party tickets and admitted as Party candidates respectively. [Text] [Warsaw TRYBUNA LUDU in Polish 30 Dec - 1 Dec 85 p 7] 12607/7687

POLITICAL SCIENTISTS MEET IN TORUN--Concurrent with the 27th Conference of the Polish Society for Political Sciences was a political science session that discussed the external and domestic conditions on Poland's political growth. The subject of discussion and analysis by political scientists were that, according to scientific forecasts, will play the most crucial role the coming years in bringing about the stability and growth of the country as well as strengthening of its position on the international forum. A new leadership of the Society was elected. Prof Dr Longin Pastusiak from Warsaw was elected chairman of the Society's Main Administration. Participating in the session and the conference was Head of PZPR Central Committee Science Department Prof Bronislaw Ratus. [Text] [Warsaw TRYBUNA LUDU in Polish 30 Nov - 1 Dec 85 p 7] 12607/7687

LAWYERS SOCIETY CONFERENCE--A meeting of delegates for the 11th National Conference of the Association of Polish Lawyers (ZPP) began in Warsaw. A mid-term review was made of the Association's activities and output. Discussion topics included ZPP's participation in law-making and law application, in shaping the society's awareness of law and its legal culture, and in inspiring legal steps to strengthen law and order. HUNGARIAN CC DELEGATION VISITS--A delegation of MSZMP Central Committee visited Poland on 25-29 November 1985. Following were the members of the delegation: MSZMP Central Committee Secretary and Somogy Provincial Committee First Secretary Imre Klenovics; Peter Kovacs, head of a sector in MSZMP Central Committee Party & Social Organizations Department; Gyula Knizse, secretary of MSZMP Fejer Provincial Committee; and Andras Levai, functionary in MSZMP Central Committee Party & Social Organizations Department. The delegation met with the leadership of PZPR Central Committee Political & Organizational Department and acquainted itself with work of party organizations in Gdansk and Bydgoszcz Provinces. During the talks, the delegation acquainted itself with forms, methods and style of work of PZPR organizations. Views were exchanged on the role of PZPR and MSZMP local organization in the process of implementation of resolutions of PZPR AND MSZMP Central Committees and National Conferences respectively. Finally, the delegation was received by deputy Politburo member, PZPR Central Committee Secretary Wlodzimierz Mokrzyszczak. Participating in the meeting were Kazimierz Cypryniak, chairman of PZPR Central Committee Political & Organizational Department, and Hungarian Ambassador Gyoergi Biczo. GDR CC AGRICULTURAL DELEGATION VISITS--Upon the invitation of PZPR Central Committee, a working delegation of SED Central Committee visited Poland on

26-30 November 1985. The delegation was led by Heinz Drescher, deputy chairman of SED Central Committee Agricultural Department. It visited the following provinces: Lomza, Bialystok, and Suwalki, where it acquainted itself with work of party cells in food processing plants and prospects for this branch of industry. The GDR guests met with Stefan Zawodzinski, head of PZPR Central Committee Agricultural Department. The delegation was also received by Central Committee Secretary Zbigniew Michalek. Deputy Premier Zbigniew Szalajda received on November 29, 1985 the leadership of the Federation of Trade Unions of Aviation and Engine-Building Industry Employees led by its chairman Stanislaw Janas. Functioning of enterprises of the branches of industry represented by the Federation under the economic reform was discussed. [Text] [Warsaw TRYBUNA LUDU in Polish 30 Nov - 1 Dec 85 p 2] 12607/7687

COASTAL SD GROUPS MEET--A meeting of the SD Provincial Committees' presidia from coastal provinces was held on 30 November 1985 in Gdansk. The discussion was focused on a natural environment protection plan for the coastal region for the period of up to 1990. A favorite opinion was expressed about the implementation of a similar plan approved a year ago. During the meeting, a common stand was arrived at to the effect that there is a need to properly coordinate the implementation of the last year's plan and to awake the society's awareness of ecological problems. Participating in the meeting were SD Central Committee Chairman Tadeusz Witold Mlynczak and Minister of Environment Protection and Natural Resources Stefan Jarzebski. PRON National Council Secretary General Jerzy Jaskiernia met in Soczewka near Plock with activists of the Polish University Student Union (ZSP). He informed them about the present situation and prospects of national agreement in Poland. Also, he answered numerous questions about the political situation after the Sejm elections. It was pointed out in the discussion that members of ZSP, which participates in PRON, should be more active in stimulating intellectual circles to solve the most grave challenges of our times that our country faces now. RUSSIAN LANGUAGE TEACHERS MEETING--A meeting of Russian language university teachers was held at the Academy of Economics yesterday to discuss problems of teaching Russian at Cracow university-type schools. It was organized by the Cracow Administration of the Society of Polish-Soviet Friendship (TPPR). Invited to the meeting were also chairmen of TPPR college committees and members of TPPR Cracow Administration Academic Committee. The goal of the meeting was to develop most effective teaching methods that would allow to master the language relatively fast. TPPR's main goals and guidelines for work in academic circles were also discussed. Participating in the meeting were, among others, TPPR Main Administration Secretary Boleslaw Borysiuk; Konstantin Sidorenko, vice director of the Warsaw branch of the Alexander Pushkin Institute of the Russian Language; TPPR Cracow Administration Secretary Jerzy Lubas; and Wladyslaw Zajezierski, head of PZPR Cracow Committee Science & Education Department. MESSNER RETURNS FROM CONGRESS--Zbigniew Messner, a member of the Polish delegation to the 27th CPSU Congress, returned to Warsaw this evening. [Text] [Warsaw Domestic SErvice in Polish 2200 GMT 3 Mar 86 LD] /12232

POREBSKI ADDRESSES SCIENCE CONGRESS--Warsaw, 6 March: The PUWP treats the congress with utmost attention and attaches great importance to it, Political Bureau member and CC secretary Tadeusz Porebski told the ongoing Congress of Polish Science here today. He said the congress was being held in a particularly crucial time for Poland as the country is facing an urgent need to map out its development strategy for the nearest several years. This will be the job of the upcoming 10th Congress of the party. The assumptions of the strategy will take into account the work of many fields of science and will be based on them to a significant extent, Porebski said, noting that it had been reflected in the draft programme of the PUWP presented to broad public debate. We see the Science Congress' debate as one of the most important voices in the discussion preceding the congress of the party, Porebski said. [Text] [Warsaw PAP in English 1412 GMT 6 Mar 86 LD] /12232

JARUZELSKI-LED DELEGATION RETURNS--The CPSU Central Committee gave a reception at the Kremlin in honor of the foreign guests who had taken part in the 27th Congress proceedings. At the reception, Mikhail Gorbachev gave a speech, and Tudor Zhivkov, on behalf of the guests, gave thanks for the invitations and the warm hospitality. In the afternoon, the PZPR Delegation to the 27th CPSU Congress, led by Wojciech Jaruzelski, made the return journey home. The Polish guests were seen off from Moscow Vnukovo Airport by Yegor Ligachev and Lev Zaykov, members of the Politburo and secretaries of the CPSU Central Committee. [Text] [Warsaw Domestic Service in Polish 1600 GMT 6 Mar 86 LD] /12232

MESSNER CHAIRS PRESIDIUM SESSION--The government Presidium has held a meeting in which preparations for spring work in agriculture were discussed and assessments of the situation in animal husbandry were made. The meeting was chaired by Premier Zbigniew Messner, and was attended by Sejm deputies; members of the Presidium of the Commission of Agriculture, Forestry and Food Economy; members of the Presidium of the National Union of Farmers and Rural Circles and Organizations; members of the leadership of the National Association of State Farm Enterprises; the Central Union of Agricultural Cooperatives; the Central Union of Peasant Self-Assistance Cooperatives; the Horticultural and Apiarian Union Cooperatives; and Central Union of Dairy Cooperatives. The government Presidium adopted the presented materials and made the appropriate decisions. [Text] [Warsaw Television Service in Polish 1620 GMT 6 Mar 86 LD] /12232

CZYREK ON CPSU CONGRESS--A press conference was held in the party's Central Committee shortly after the PZPR delegation's return from Moscow. Taking part were members of the delegation to the 27th CPSU Congress, Jozef Czyrek and Jerzy Romanik. Referring to this important event in the life of the Soviet nation, of the whole socialist community, Jozef Czyrek emphasized the historic significance of the Soviet communists' congress. He spoke of the significant enrichment of theoretical and practical achievements in the work of socialist construction. The decisions made during the congress accept the need for an acceleration of the socioeconomic development of the land of the Soviets. Much attention was paid to the shaping of new human attitudes, to the need for unhampered discussion about everything which hurts and hinders the fulfillment of the defined aims. Participants at the congress, in the names of their parties, organizations, fully approved the program, which is the fruit of often controversial discussions. The meeting was chaired by Jan Glowczyk. [No video available] [Text] [Warsaw Television Service in Polish 1830 GMT 6 Mar 86 LD] /12232

JARUZELSKI, MESSNER AT SCIENCE CONGRESS--Warsaw, 7 March--After the plenary discussion, the participants at the Third Polish Science Congress started to work on its final documents, that is a general resolution and a statement. This part of debates is attended by the president of the Council of State, Wojciech Jaruzelski. Present are Premier Zbigniew Messner and Sejm (parliament) speaker Roman Malinowski. [Text] [Warsaw PAP in English 1717 GMT 7 Mar 86 LD] /12232

JARUZELSKI, MESSNER MEET SCIENTISTS--A group of scholars participating in the Congress of Polish Science had a meeting last night in the Belweder Palace with Wojciech Jaruzelski, chairman of the Council of State. He said that the political and state leadership is very concerned about getting authentic and honest appraisals of the state of science and its capabilities. The congress created opportunity for that. The meeting, which lasted almost 4 hours and ended late at night, was attended by Premier Zbigniew Messner. [Text] [Warsaw Domestic Service in Polish 0600 GMT 8 Mar 86 LD] /12232

MESSNER ADDRESSES KRAKOW COMMITTEE--The efforts of scientists must be focused on solving problems of the economy, said Zbigniew Messner at a meeting in the Krakow Party Committee. An important matter for the development of Polish science and its effectiveness, the premier emphasized, is to renew its links with world science and especially to establish close cooperation with scientists from the CEMA states. He also added that the success of the program for extensive participation of science in the country's economic life will be decided equally by the concretization of individual programs and proper personnel policy in academic circles. [Text] [Warsaw Domestic Service in Polish 0600 GMT 15 Feb 86 LD] /12232

YOUTH AGREEMENT WITH USSR--A cooperation program between the Polish youth organizations and the Soviet Komsomol was signed in Moscow today. The new element marks an increase in the participation of youth from both countries in solving issues relating to economy and scientific and technological development. The documents were signed by Jerzy Szmajdzinski, chairman of the Main Board of the Union of Socialist Polish Youth, and representatives of the Union of Rural Youth, the Polish Scout Union and the Association of Polish Students. Viktor Mishin, first secretary of the Komsomol Central Committee, signed for the Soviet side. [Text] [Warsaw Domestic Service in Polish 1830 GMT 17 Feb 86 LD] /12232

DEBT AND LABOR PROBLEMS--A meeting of first secretaries of the basic party organizations from the capital and municipal voivodship with the executive of the PZPR Warsaw Committee was held in the Congress Hall in Warsaw under the slogan The Strength of the Party Lies in Activities of the Basic Party Organizations. A draft party program and social and economic tasks of Warsaw voivodship were discussed. Taking the floor in the discussion, Marian Wozniak touched upon the issues of the country's complicated economic situation. He spoke, among other things, on the level of our debts to capitalist countries, at the same time pointing out low quality, examples of bad labor organization and the lack of efficiency in the management of numerous enterprises. In the process of shaping economic awareness, the mechanisms of economic reform itself are not sufficient enough, Wozniak said. [Text] [Warsaw Domestic Service in Polish 2200 GMT 22 Feb 86 LD] /12232

PZPR VOIVODSHIP SECRETARIES CONFERENCE--A conference of PZPR voivodship committee secretaries was held on 13 February 1986, under the direction of Marian Wozniak, Politburo member and secretary of the PZPR CC. The talks dealt with the handling of crucial social policy problems and with the joint efforts of the PZPR with trade unions and self-management crews in their implementation. The participants underscored the important role of the unions and workers self-management in the process of implementing economic reforms, in raising management efficiency, and in encouraging broad-based public support for rationalization, innovation, resources conservation, and product quality. It was concluded that unions' and workers' self-management activities should promote raising the level of worker understanding of economic affairs, encourage their social and production activities, and strengthen the active participation of the working class in the process of economic planning and management. [Text] [Warsaw TRYBUNA LUDU in Polish 14 Feb 86 p 2] /6091

SOVIET AMBASSADOR VISITS--On 13 February 1986 the Soviet ambassador, Vladimir Brovikov, visited Deputy Marshal of the Sejm Mieczyslaw Rakowski. The visit marked the beginning of Brovikov's diplomatic mission in Poland. Ambassador Brovikov also visited Deputy Marshal of the Sejm Marek Wieczorek on the same day. [Text] [Warsaw TRYBUNA LUDU in Polish 14 Feb 86 p 2] /6091

EDUCATION PROBLEMS DISCUSSED--A 3-day seminar on the fundamental problems of party-educational activities was concluded at the PZPR CC Party Training Center. Participants included the secretaries of teachers committees and staff members of PZPR voivodship committees working with educational issues. The aktivs' main concern was to assure the effective implementation of the resolutions set forth by the 24th Plenum of the PZPR CC. [Text] [Warsaw TRYBUNA LUDU in Polish 14 Feb 86 p 2] /6091

KALISZ, TARNOBRZEG DEFENSE COMMITTEES--The Kalisz and Tarnobrzeg Voivodship Defense Committees held meetings on 14 February 1986. In Kalisz, the committee discussed the socioeconomic achievements of the PZL Transportation Equipment Plant. In Tarnobrzeg, in cooperation with the Voivodship Delegates Caucus, the committee evaluated the implementation of tasks in combating social parasitism. POLITICS ROMANIA

PARTY WORK IN TRANSPORT, TELECOMMUNICATIONS MINISTRY

Bucharest SCINTEIA in Romanian 11 Dec 85 pp 1, 2

[Article by Constantin Priescu and Anica Florescu: "Active Participation, One Filled With Responsibility in the Fulfillment of Major Tasks"]

[Text] In the 21 base organizations subordinate directly to the party committee in the Ministry of Transportation and Telecommunications - those within the department of the railroads, the department of ship transportation and the general directorate of posts and telecommunications - over 870 communists are working. If we also take into account the communists in the other sectors of the ministry who have their own party organizations that are not subordinate to the party committee there - those within the department of civil aviation, the Central for Vehicular Transportation and those in the four research and design institutes involved in transportation problems - we can see that the number of people increases considerably. The existence of a significant number of communists shows right from the start the fact that within the framework of the Ministry of Transportation and Telecommunication powerful base organizations are at work which can and must make a significant contribution to mobilizing party members and the other workers in carrying out the policies of our party and state in this sector of great importance for our national economy.

The permanent direction of the communists' work and the focusing of their efforts towards the important goals of the ministry are achieved by way of the problems which the party committee periodically places on its agenda and by way of the analytical and revolutionary spirit in which these problems are to be approached and transmitted as a means of thinking and acting to each communist.

Have and are these requirements being met in actual practice?

The answer to this question must first of all begin with the sharp criticism directed not long ago by the party leadership in connection with the manner in which activities are being carried out in this sector and the manner in which they are being managed. In the 4 September 1985 session of the Political Executive Committee of the RCP Central Committee, it was clearly stated: "The Political Executive Committee evaluated as unsatisfactory the activity of the Ministry of Transportation and Telecommunications and the management of this ministry - and has asked that measures be taken urgently to ensure the radical improvement of work and the fulfillment of the tasks of this sector under the best possible conditions." Let us similarly begin with a requirement formulated by comrade Nicolae Ceausescu, the secretary general of the party, at the recent plenary session of the Central Committee: "The leadership council of the Ministry of Transportation must work with more responsibility for strengthening discipline and order and for carrying out transportation under good conditions."

What are the causes that have brought about such exigencies regarding the activities in this sector?

Among these causes - with most of them belonging to the inappropriate manner in which the leadership council of the ministry and the communists who belong to this organism have occupied themselves and worked to implement the tasks that have been established in the field of transportation - we can also see the fact that in the working style of the party committee and in their approach to economic tasks there have been and are serious shortcomings. These are shortcomings which, once decisively eliminated, can also naturally bring about improvements to all management activities and can imprint an involved, revolutionary working style that is designed to put to best use the thoughts and actions of each communist in the exemplary fulfillment of the especially important tasks of this ministry. As was stressed at the recent plenary session of the RCP Central Committee, the improvement of party organization activities and the forms of management and the strengthening of responsibility, order and discipline are determining factors for ensuring good management in overall economic activities. Through the prism of these requirements and the exigencies formulated by comrade Nicolae Ceausescu it is necessary to work fully decisively to eliminate negative states of affairs and deficiencies in the work style of the party committee.

First of all, we are talking about the manner in which the committee exercises its function as the leading political force and the way in which it analyzes the activities carried out by communists and personnel having responsibilities for fulfilling the major economic objectives of this important sector of the national economy. The analyses in this field that have been carried out by the party committee are far from what they should be - of a deep examination of the causes that generate shortcomings, of seeking and finding solutions and of adopting certain technical and political-organizational measures that will involve all the communists, specialists and workers in the ministry in resolving this situation. Quantitatively, these analyses are doing much on important problems. Reviewing the number of topics of these analyses - "The Concerns of the Communists in the Department of Ship Transportation for Strengthening Order and Discipline in the Maritime and River Fleets," "An Analysis of the Manner in Which the Ministry's Party Committee and Leadership Council Work to Fulfill the Program to Increase Labor Productivity," "The Concerns of the Communists in the Railroad Department for Strengthening Traffic Safety," "Analysis of the Inappropriate State of Work in Investment Projects and the Establishment of Measures to Recover Arrearages" - you would expect that these would have brought about an improvement in the work in the areas that were analyzed and that they would have represented a test of the competency and revolutionary responsibility for the party committee and the communists who head the respective offices. In reality, these analyses - beginning with the manner in which they were conceived (short reports that were frequently written precisely by those who head the respective areas) and ending with the manner in which they were concluded (in addition to the fact that the measures adopted following these analyses were not thorough, the party aktiv did not participate nor did the experienced communists, their implementation did not constitute a decisive stage of political activity) - tend more to mimic an approach to the major problems of the ministry than an effort to effect them in their essence.

In April, for example, the party committee analyzed the concern of the communists in the department of ship transportation for strengthening order and discipline and for the efficient use of the available ship capacity. One such subject submitted for discussion at an opportune moment - after the first working quarter, when the end of the difficulties imposed by a harsh winter was imminent and when it was possible to outline a true "strategy" of action - was the strengthening of political work in this field to make up for the shortfalls that had occurred. And, the report presented by the bureau of the base organization and the management of the department before the party committee represented not a thorough analysis through which they would be involved by name and according to their positions and responsibilities, as well as all the communists responsible for coordinating activities in this area, but rather a "demonstration" of numerous reviews that had been carried out by the specialists in the department throughout the units in order to strengthen order and discipline. It went so far that instead of establishing the causes of the inefficiency of the review, it dealt with statistics from the last 2 years even though it was analyzing the situation of a single quarter - and it took into account... over 2,000 reviews (???). Is it possible for this analysis, which abounded in justifications and in numbers showing the frequency of reviews, to make a good impression upon someone? It is certain, however, that it did not have and could not have a real efficiency. This is also undoubtedly proven by the fact that a later review, carried out by a group from the RCP Central Committee tasked with analyzing the causes of the overall inappropriate activities of this ministry and with establishing measures to radically improve work there, revealed the most serious deficiencies in the area of ship transportation, linked especially to the inappropriate use of ship capacities in the country's maritime and river fleets. In order to eliminate these deficiencies, the necessary technical and political-organization measures have only now been established.

The efficiency of analyses carried out by a party organ is determined in the end, as is known, not by the number of analyses, but rather by their quality and by their ability to uncover in a timely fashion the causes which generate deficiencies and shortfalls, to establish effective measures to correct a situation and to ensure the effective participation of all resources to achieve this.

That this was not understood in a fully responsible way either after the reviews that were carried out or after the measures were established, is also shown by the manner in which they dealt with the situation of failing to achieve in the plan in base organization No 2 - the directorate of railcar traffic - within the framework of the railroad department on the occasion of the annual general assembly for reporting. Before the communists, the report of the bureau of the base organization (secretary: engineer Constantin Tabacaru) "dealt" with, among other things, the situation in the following manner: "Although comrade Iulian Tudose, deputy minister, did everything to set things right, activities in the field of rail transportation continue to record serious deficiencies." What kind of criticism is this? Does this base organization feel that such a criticism in any way helps to set things right? Does the party committee believe that in this way it will be able to ensure a radical improvement in party activities in the ministry, as the party leadership requested?

Naturally, there are other means of party work through which the base organization and the party committee can mobilize the activities of the communists and their revolutionary spirit. In increasing their contribution to resolving the complex problems of the transportation sector, the party committee can call upon and must call upon to a greater degree than up to now the specific, differentiated effort of each communist so as to better use both the potential of the individual and that of the group to which the individual belongs. Over 60 percent of the party members in the ministry, by virtue of their job functions, are traveling among the units and are carrying out guidance and review activities. Has the party committee ever analyzed - as would be natural and necessary - this facet that is so important and essential to the activities of the communists in the ministry in order to thoroughly understand the problems in the field and how to resolve them? "No, not to date, no," the party committee secretary tells us. "We have his requirement in mind for the next stage." And, is not each communist asked, in the spirit of the Party Statutes, to permanently carry out his professional tasks - including those for which he travels into the field - of knowing in a timely fashion which problems have been resolved and which have not. This means if he does not do this he leaves things to run by themselves, he does not carry out a political-organizational activity in accordance with the requirements and exigencies placed before the party committee in the ministry and before each communist. But, the deficiencies of such a work style are also clearly shown in the overall results that have been obtained to date in the ministry, where only two sectors - posts and telecommunications and the department of civil aviation - have shown positive results.

Recently, the bureau of the party committee established the practice of requesting nearly monthly reports regarding the activities carried out by the bureaus of the party organizations and by the communists for fulfilling their professional tasks and the affairs of the organization. Through the prism of the need to understand the positive experiences in this area and to ensure their spread, this is a good direction. It should not, however, replace the statutory requirement - which each communist has - to periodically present individual reports before the base organization or the party committee to which the person belongs. In the Ministry of Transportation and Telecommunications, there is, unfortunately, such a tendency. For example, to date, there has not been presented a single report - with the exception of one case - by a member of the party committee or a person from the leadership of the ministry, even though the number of personnel - beginning with office chiefs and deputy director generals - is much greater than 200. The absence of such reports, such open, communist reports, can have consequences and bring penalties - and, as has been seen, brings them both to the act of technical-administrative management and to political leadership.

It is true that in the latest period, beginning especially in October, the party committee has reconsidered its work style and, in the spirit of the exigencies established by the party leadership, is giving the greatest attention to realistically drawing up the analyses that have been involved, involving the party aktiv and thoroughly analyzing the work that has been carried out by those communists having responsible positions and by all the communists in the ministry on the basis of activity reports. All this constitutes, without a doubt, a guarantee for the improvement of the general activities of the ministry - and first of all for the use indices for the means of transportation in the railroad and maritime-river sectors, and, on this basis, for increasing economic efficiency.

One last problem which we will bring into discussion in connection with increasing the contribution of the communists in dealing efficiently with the major problems of this ministry refers to the development of a permanent cooperation - on one hand between the party committee within the Ministry of Transportation and Telecommunications and the party organs and organizations in the sectors of the ministry which are not subordinate to it and, on the other hand, the party committees in the other ministries which benefit from transportation services. Such cooperation, promoted either from the direct initiative of the party committee in the ministry or coordinated by the municipal party committee and the party committee in Sector No 1, would be capable of ensuring the overall more efficient involvement of party organs and organizations in the fulfillment of the important tasks in transportation. Such cooperation, achieved through the specific methods of party work, would be able to transmit its results over time through the intermediary of the communists in the ministry down to the base organizations by way of the rational use of technical resources, the reduction of transport costs, the more powerful development of rail transportation, the regular satisfaction of the requirements of the national economy and the growth of efficiency in all economic activities. This would be beyond a doubt in the interest of party activities and the national economy.

Benefiting this year from the direction and on-site guidance and from the conclusions formulated on these occasions by the two review groups from the RCP Central Committee, it is absolutely necessary now to have a radical improvement in the work style and methods of the party committee and the base organizations in this ministry - through the implementation of the lessons that have been shown and the measures that were established. And, the purpose is for party work, through its many means, to become really the decisive factor in improving activities in this ministry for the promotion of a new, higher quality in all its sectors and for ensuring high economic efficiency.

HIGH JOB TURNOVER RATE CONTINUES IN INDUSTRY

West Berlin IWE TAGESDIENST in German No 33, 28 Feb 86 p 1

[Article datelined IWE Berlin, 28 Feb 86: "Continuing High Job Turnover in GDR Industry"]

[Text] Labor force turnover in GDR industry continues to be relatively high, as is shown in studies published by the scientific journal of the Dresden Technical University. It was stated that the problems arising from this had "not diminished in significance." The principal reasons cited for the effort to change jobs were dissatisfaction with job duties, with the intellectual demands of the work, with the relationship between performance and salary, and with the labor organization. Contradictions between the qualifications possessed and the potential for putting them to practical use led to "a high degree of effort to change jobs." It was stated that in various branches of industry, more than two-thirds of the skilled workers in undemanding job slots had attempted to change jobs. This indicated a trend: in the case of workers possessing higher than requisite qualifications to perform job duties, the effort to change jobs was "especially evident." The studies confirmed previously obtained sociological data showing that workers' willingness to change jobs decreases with increasing age. According to the data, 32 percent of the workers under 20 strove to make a job change in the same plant, and 37 percent to change plants; in the case of those over 50, the corresponding percentages were 20 and 1. A similar relationship existed with respect to length of service in the plant.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

FARM COOPERATION COUNCIL STRESSES ROLE OF COMMERCIAL CONTRACT

East Berlin BAUERN-ECHO in German (supplement No 371) 6 Aug 85 pp 697-698

[Article by Dr Gerhard Greiner, contract judge and department head at the State Contract Court of the Council of Ministers of the GDR: "What Importance Have Commercial Contracts for the Work of Cooperation Councils?"]

[Text] The LPGs and VEGs of plant and animal production are linked to each other by a natural correlation in the uniform reproduction process of soil --plant--animal--soil. Organization of these cooperative relations by the LPGs and VEGs determines to a decisive degree production and its effectiveness. The Central Committee's report to the 10th SED Party Congress states: "The organization of cooperation is to serve to perfect the working together of LPGs and VEGs with their partners to their mutual advantage. All proven forms of cooperation should be continued . . .This concerns the cooperation councils of plant and animal production in particular, who have to ensure effective cooperation in the uniform reproduction process." (Footnote 1) (Report of the SED Central Committee to the 10th Party Congress of the SED, reporter Comrade Erich Honecker, Dietz Verlag, Berlin 1981, p 76)

Practical experience has proven that cooperation is the proper way for comprehensive implementation of intensification which will open up new forces of production and effectiveness development over a long period of time. (Footnote 2) (See Musterkooperationsvereinbarung Model Cooperation Agreement , GBl I, No 17, 5 July 1985) Intensifying cooperation is therefore an essential precondition for continued successful implementation of the SED's economic policy.

On the basis of Article 12 of the LPG Law, and for an effective organization of the uniform reproduction process of plant and livestock production within the cooperation, LPGs and VEGs delegate to the cooperation council rights and obligations to take responsibility for carrying out joint measures of management, planning and economic accounting. The extent of authority delegated to the cooperation council depends on the concrete state of development. As legal forms for regulating cooperation relations, the government has recommended that LPGs and VEGs apply the statute, the cooperation agreement and the commercial contract (Article 16, paragraph 1, LPG Law).

In practical terms of LPGs and VEGs working together in cooperations, the cooperation agreement has taken on special significance. It contains the goals of joint cooperative work, rights and duties of the cooperation partners, management forms of the cooperation, powers of the bodies, representation in legal relations, and the principles of cooperative work. The experience collected so far was incorporated in the model cooperation agreement. (Footnote 3) (op. cit.)

An equally important role is played by the commercial contract in organizing and implementing cooperation relations within the cooperation. For example, the cooperations have master contracts for delivery of fodder and organic fertilizer, which are put into specific terms in annual contracts, taking into accoun the plans of the cooperating enterprises and the plan of the cooperation.

The model cooperation agreement specifically confirms the role and position of the LPGs and VEGs of plant and animal production as the basic units of agricultural production. Legal autonomy and economic self-responsibility are essential conditions for working together in a comradely fashion to master the uniform reproduction process, to utilize production and effectiveness reserves, and to ensure a stable development of all partners on the basis of one's own performance.

The cooperation council as elected body of the cooperation partners among other things carries out delegated tasks in the area of cooperation relations. (Footnote 4) (op. cit.) Based on state target indices and the long-term development concept of the cooperation, it must establish the plan of the cooperation of the LPGs and VEGs and assign tasks to the cooperation partners to establish their own operating plans. With the defense of the operating plans and the ensuing conclusion of a contract, the cooperation council ensures the unity of the "plan of the cooperation of the LPGs and VEGs," the operating plan, and the contract.

The sphere of influence of the cooperation council concerns not only intra-cooperative contracts (fodder, fertilizer), but also contractual relations with partners outside the cooperation resulting from the tasks contained in the operating plans of the LPGs and VEGs regarding the delivery and purchase of products (milk, meat, potatoes, machines, investments, etc.).

The control duties of the cooperation council also imply that it must deal on a regular basis with the state of plan and contract fulfillment and must take appropriate measures in case of failures. The commissions can be given certain tasks to assist in this work. It proved effective to have the commission on fodder exercise control over the fulfillment of the fodder contract, make decisions concerning failures or for better fulfillment of the contract, and prepare decisions for the cooperation council.

For instance, at the Cooperation Sprotta, kreis Eilenburg, deviations were found regarding hogs in the monthly assessment of plan and contract fulfillment. As a consequence, the cooperation council ordered a temporary redistribution among the partners to ensure the necessary total yield. This avoided delivery of slaughter animals with insufficient weight. (Footnote 5) (See Taubert, Kaufmann, Walter: How the Sprotta Cooperation Council Carries Out its Responsibility for the Uniform Reproduction Process, KOOPERATION No 11/1984, p 491)

To deepen cooperation relations, the cooperation council also is in charge of the following tasks, which are of importance for the conclusion and fulfillment of contracts:

--Coordinating forces, means, funds and labor to fully utilize the available potential for a high performance increase;

--Determining basic proportions and performance goals, especially in order to overcome unjustified differences in levels of production and effectiveness;

--Organizing joint measures of scientific-technical progress, and bringing about the comprehensive use of the concepts of highest yield and highest performance;

--Planning investments, and carrying out joint investments;

--Organizing economic relations, and developing business administrative regulations (agreed-upon prices, delivery and performance conditions of fodder and organic fertilizer, mutual assistance with labor, machines, fixed assets, etc.). (Footnote 6) (Compare Model Cooperation Agreement, op. cit.)

In practical experience, the commercial contract has proven itself as an instrument of incentive. This is also expressed in the model cooperation agreement. In Paragraph I No 3, the conclusion of commercial contracts by LPGs and VEGs is called an important expression of legal autonomy and economic self-responsibility. It states further: "The cooperation partners form their delivery and performance relations in the cooperation also on the basis of commercial contracts."

DEVELOPMENT, MODERNIZATION OF ANIMAL HUSBANDRY

Bucharest REVISTA ECONOMICA in Romanian 4 Jan 86 pp 14-15

[Article by Gh. Georgescu and N. Severin, "Nicolae Balcescu" Agronomic Institute: "Features of the Intensive Development in Zootechny"]

[Text] In view of the importance that animal husbandry has for the national economy and for raising the standard of living of the working people, our party has devoted--especially after the ninth congress--special attention to organizing and developing modern, large-scale zootechny that would provide high outputs of meat, milk, eggs, etc.

The Growth in the Degree of Industrialization

Today, big and modern state and intercooperative enterprises for raising and exploiting various species of animals are sensibly distributed throughout the country. They represent the backbone of zootechny, model units from all viewpoints, simultaneously representing for the respective zones centers for promoting scientific research and the improvement of the breeds of animals, both for the IAS's [state agricultural enterprises] and CAP's [agricultural production cooperatives] and for the farms of CAP members and the private farms.

The exploitation of species once considered "Cinderellas" of zootechny has had wide development in recent 5-year periods. Such is the case of chickens and turkeys, for instance, and in the context of the growth and diversification of animal production, the raising and exploitation of other species (hares, coypus, minks, and so on) are raising their percentage in the agrarian economy.

The organization of the zootechnical enterprises is conceived on the principle of the concentration of populations and the specialization of farms, which has many advantages; being in fact attributes of the growth in the degree of industrialization, in these units, the routine, intuition, and "eye" of the breeder are being replaced more and more by modern methods of establishing the optimal solutions and decisions. More and more, the chief accountants are involved in the records of the productive performances of the animals and of the market conditions, with a view to decisionmaking.

Animals with high productive and reproductive performances, imported or improved in the country, populate modern stalls, with a controlled and directed microclimate for some species. Very subtle husbandry technologies, devised on the basis of thoroughly knowing the animal organism's requirements and its physiological and behavioral reactions, are applied with a view to obtaining outputs as close as possible to the high genetic potential. An entire industry for making technical equipment for the zootechnical sector has come into being, with the high degree of mechanization and, sometimes, automation providing high precision in applying the technologies and raising the labor productivity. For some species, such as hogs and chickens, the labor productivity--as a result of the high degree of mechanization, the scientific organization of labor, the high productive performances, etc.--rivals the labor productivity in the more profitable industries. The industry producing mixed feed for hogs, poultry and other species has been developed.

Networks for improvement, selection, hybridization, and reproduction of animals, which achieve biological material competitive on a world level, have been set up. It is worth bearing in mind that, at present, only hybrids of chickens are exploited, which represents one of the most notable practical applications of genetics in zootechny. The exploitation of hybrids also extends to other species, such as ducks, turkeys, rabbits, etc. Illustrating the spirit of foresight for the further development of animal husbandry, "gene libraries"--veritable "banks" for storing and preserving genes, the genetic endowment for future generations--have been set up for various species. The gene library at the Constanta IAvS [State Poultry Enterprise] is one of the few in the world of its size, concerns, and achievements. The preparation and application of highly effective programs and technologies regarding veterinary-health prophylaxis and the production of highly effective drugs, serums, vaccines, and other preparations play a prominent role in the reduction of mortality and the obtaining of high performances.

Zootechnical scientific research has grown strongly, in institutes specializing in species and some special problems of general importance. In fact, the researchers in these scientific units, together with the teaching personnel from higher education, represent "general staffs," which, through interdisciplinary scientific research activity performed on the basis of programs of national or specific interest, improve the productive performances of the animals, optimize the reproduction, the feeding, and the husbandry technologies, and substantiate and work out all decisions for action. Clearly, the research on the production and preservation of fodder and the veterinary scientific research, meant to provide healthy animals for exploitation, go along this line.

For some species, such as hogs, chickens, turkeys, and so on, the high level of technical equipping of the enterprises, the application of technologies devised on the basis of new gains in science and technology, the use of operational research, the steady delivery of products throughout the year, the scientific organization, planning, and management, the high labor productivity, the methods of prospecting the market and forecasting, the multilateral training of the work force, the improvement of the production relations and social relations, etc. have imparted the attributes of industry to the raising of the respective species and have turned it into a variant of industrial activity.

Higher Levels of Outputs

On the instructions of Comrade Nicolae Ceausescu, animal husbandry has made great strides on the farms of the CAP members and on the private farms in areas without cooperatives. Enjoying many advantages, from obtaining animals with a high production potential, technical equipment, and technical assistance from the state, to securing the utilization of the products through contracting with the state on stimulative terms, the respective categories of producers contributed to the centralized supply and the market supply in 1983 about 49 percent for meat, 72 percent for cow's milk, 49 percent for wool, 58 percent for eggs, and 91 percent for honey.

The zootechnical sector's development is reflected clearly and convincingly by the following data. The animal populations in 1984 were higher by 36.8 percent for cattle, 167.4 percent for hogs, 40 percent for sheep, 197.5 percent for poultry, and 39.6 percent for bee families than in 1966. Regarding the average outputs per animal, in 1983 they were higher by 28.1 percent for the commodity output of milk, 21 percent for wool, 76.2 percent for eggs, 56 percent for honey, etc. than in 1965. As a result, the gross outputs in 1983 were higher by 112.5 percent for all meat, 22.6 percent for beef, 110.1 percent for pork, 426.1 percent for poultry, 45.9 percent for sheep, 67.2 percent for cow's milk, 55.7 percent for wool, 193.5 percent for eggs, and 91.8 percent for honey than in 1965. It is worth pointing out the fact that the growth of the outputs in general was due particularly to the improvement in productive performances.

The rise in fodder resources made a remarkable contribution to obtaining these results. If we refer just to cultivated fodder plants, one notes the fact that from 1965 to 1983 the production of the various crops rose by 284 percent on the average and the amount of fodder per head of cattle rose by 212 percent on the average. Considering that the area cultivated with fodder plants fell by approximately 4 percent during the respective period, it follows that the improvement in fodder resources was achieved exclusively through the intensification of the agrotechnical methods and the use of cultivated seed. The 4 million hectares of natural pastures and meadows in the hilly and mountain zone, toward which the center of gravity of cattle and sheep raising is shifting more and more, must also be added to the production of cultivated fodder.

In 1983, due to the growth in populations, average outputs per animal, and gross outputs, zootechny's percentage in agriculture, expressed by the value of the gross output, was 44.2 percent, that is, 20.1 percent higher than in 1965. This means that, although the achievements are quite remarkable, there is still much to do, because it exceeds 50 percent in the developed countries.

The development of zootechny had as a result the growth of the per capita annual consumption by 84 percent for meat, 41 percent for milk, 151 percent for eggs, 200 percent for honey, etc. from 1965 to 1983.

Highly Qualified Specialists

The successes achieved in animal husbandry would not have been possible without qualified specialists. After the attempt, initiated in 1962, to train specialists with a very broad grounding--both for the exploitation of animals and for the protection of their health--the objective necessity of specialization in the following professions, a necessity generated by the extreme complexity of intensive-industrial animal husbandry, resulted beyond a shadow of a doubt within the social division of labor: the zootechnical engineer, who is the engineer of the animal "industry," and the veterinarian, who provides healthy animals for exploitation. As a consequence, zootechnical education--secondary and higher--was reorganized.

The zootechnical engineer is a specialist armed with a high scientific conception and technological, organizational, and economic thought, which confer on him the capacity to organize and manage in big enterprises of an intensive-industrial type the processes of reproduction, raising, exploitation, and improvement of huge populations of animals and to assume engineering responsibilities in the research and planning of the devising and optimization of the technologies and their technical components, for increasing the outputs and the economic efficiency.

Today, 234.8 percent more zootechnical engineers and 96.8 percent more zootechnical personnel with secondary training work in agriculture than in 1965.

Greater Tasks in the Current 5-Year Period

The directives of the 13th RCP Congress provide for the 1986-1990 5-year period tasks and measures that would further provide, in the context of the new agrarian revolution, the intensive development and the modernization of zootechny and the speedup of the growth of animal production through the better organization and use of the material base and the application of advanced achievements and technology.

The improvement of the material base and of its exploitation, the raising of the birth rate and the lowering of the death rate, and the consolidation of fodder resources will create conditions for the populations to reach 11 million cattle, 15 million hogs, 28 million sheep, and 80 million egg-laying poultry at the end of the 5-year period, thus being up to 26 percent higher than in 1985, depending on the species. Big rises in the average outputs per animal--under the conditions of the reduction of material and energy consumptions--are also planned, to which the genetic improvement of the populations will also make a big contribution. Ultimately, all these things will have as an effect the growth of the total production. The total production in 1990 will be higher by 38-41 percent for meat, 46-51 percent for cow's milk, 12-19 percent for eggs, 27-35 percent for wool, and 26-33 percent for honey than in 1981-1985. Sericulture and pisciculture too will undergo significant development, with the output of silk cocoons being 15,000 tons and the output of fish from inland waters being 185,000-200,000 tons in 1990.

The experience and competence of the workers in zootechny and their self-sacrifice represent the guarantee that these tasks will be fulfilled, so that animal husbandry's percentage in agriculture will exceed 50 percent.

SOCIALIST ALLIANCE MEETING ON AGRICULTURAL PROBLEMS

Belgrade EKONOMSKA POLITIKA in Serbo-Croatian 24 Feb 86 pp 10-11

[Excerpts] At a marathon meeting on 19 February of the Federal Conference of SAWPY on the socioeconomic development (lagging) of agriculture and the rural community, delegate Martin Ban noted (and he was not refuted) that farmers are not represented in decisionmaking on agriculture; in fact, others, not farmers themselves, are dealing with...the problems of agriculture.

The new plan calls for a 5-percent increase in agricultural production (an increase of 4 percent was planned for the previous period but production actually rose by less than 1 percent). Only one thing is certain now on the eve of spring planting, namely, that it will be the most expensive planting period up to now--seed, fertilizer, and fuel will be more expensive, and it was noted that this year a large number of farmers will turn to producing for their own needs only because producer prices and interest rates are so high. Last year the total cost increase for farmers was 82 percent, while the price of farm products increased 32 percent.

Turning its attention to the associating of farmers, the SAWPY meeting noted that about 12 percent of farmers are associated, while about 70 percent have loose ties to the socialized sector through cooperation. It is believed that farmers lack the motivation to associate: Cedo Grbic believes that private farmers would associate, even with land, but only if association offered them a real chance to triple or quadruple their income.

It was noted that every year 33,000 hectares of agricultural land goes out of cultivation, totaling up to now over 800,000 hectares of uncultivated land. The number of farm households composed of older citizens is growing, as is the number of mixed households [farms with members working in towns and cities] and farms with ever-smaller land areas. Land plots should be enlarged but a method has not yet been established for this (althouth in some republics and provinces the leasing of uncultivated land exceeds the maximum [permitted]). Not much can be expected either in the socialized sector. Berislav Sefer believes that this sector could not efficiently cultivate an additional 3 million hectares [as published] even if all this land were ceded to it without compensation. This is, of course, only a hypothetical case, since it cannot acquire land without compensating [the owner] and the socialized sector has no capital accumulation for buying more land.

Cedo Grbic said that there are no real prospects for creating 50-100-hectare farm households soon, but this process should be made possible: the opportunity should be offered to anyone who wants to cultivate the land, to invest in it, and to carry out his obligations. The view prevailed at the meeting that there is simply no hope for agriculture if the village is not revitalized. In order to attract (or hold or return) young people and also specialists to the village, the village must be urbanized and its distance from city and cultural life must be compensated by earnings which will be high enough to hold youth on the land and attract specialists.

EAST-WEST TRADE DEALS REPORTED

Warsaw POLITYKA in Polish No 8, 22 Feb 86 p 15 supplement POLITYKA EKSPORT IMPORT No 4, Feb 86

[Article: "East-West"]

[Text] GREAT BRITAIN-USSR: The British firm, John Brown Automation, Coventry, will supply the USSR with an automated assembly line for the production and testing of large-diameter clutches (38 cm) that will be installed in late-model field combines. The completely automated, 15-station assembly line will make it possible to assemble a clutch unit every 15 seconds; the annual production capacity will be 185,000 units. Tracking the assembly line and final product quality control will be controlled by a computer system. The value of the contract is £4 million.

ITALY-CZECHOSLOVAKIA: The Czechoslovak enterprise, Tuzex (counterpart of Polish Pewex), ordered 500 cars, model Uno 45, from Fiat. These cars, together with 200 Ford Escorts and 200 Sierras, will be available through Tuzex in 1986.

YUGOSLAVIA-GREAT BRITAIN: During the last season, the Yugoslavian tourist bureau, Jugotours, noted record transactions in the sale of tourist services in Great Britain. British tourists spent a total of nearly 2.5 million days in Yugoslavia; this makes Yugoslavia the most popular site for summer holidays (next to Greece).

HUNGARY-GREAT BRITAIN: The Hungarian Institute of Market and Economic Research sponsored an agreement for exchange of information with the information service of the British weekly, THE ECONOMIST. Beginning this year, the international economic service, which includes basic economic indices from 84 countries, prepared by the British weekly, will be published in Hungarian.

ARGENTINA-CUBA: Argentina is participating in the expansion and modernization of the tourist base in Cuba. On the basis of a recently signed contract, the Argentine construction firm, Comarco, will begin construction of eight hotels, total value, $120 million. The agreement involves building one four-star and seven three-star hotels in the Cuban resort, Veradero, with a total of 2000 beds. Construction will take 5 years.

Financing is based on a 6-year credit granted Cuba by the Argentine Central Bank.

HUNGARY-CAPITALIST COUNTRIES: In 1985, the number of cooperative agreements signed by Hungarian enterprises with partners in western countries exceeded 500. Transactions based on cooperative agreements are valued at approximately $400 million annually, which is approximately 5 percent of the value of Hungarian foreign trade. Most of the agreements (213) were concluded with enterprises from West Germany; 61 with Austria; 39 with Yugoslavia; 30 with France; 24 with Switzerland; 20 with Sweden; and 13 with the U.S.A. The idea behind cooperative agreements is the purchase of licenses and "know-how," which is subsequently paid for by selling the products. Hungary is also trying to expand cooperation of the "joint venture" type with western enterprises. At present approximately 50 such agreements are functioning. To attract foreign investors, Hungary is also trying to simplify the procedures for granting licenses for this kind of activity and is granting significant tax relief. Foreign partners may at present hold the dominant share in investments. After a period of stagnation, in the last 2 years there has been greater interest on the part of western investors in this kind of cooperation.

AUSTRIA-USSR: The Soviet central bureau, Soyuzvneshstroiimport, signed a contract with the Austrian company, ABV, for reconstruction of a sports complex in Gudauri, Georgia. The Austrian firm will be in complete charge of the construction of a 300-bed hotel, four ski lifts and adjunct construction, as well as a mountain rescue station. All of the equipment and sports equipment for training will be supplied by Austria. The hotel will have a swimming pool and a gymnasium. Gudauri is located at an elevation of 2000 meters, 120 km from Tbilisi, the capital of Georgia. The sports complex will meet the requirements of centers for skiing congresses. The work is to be completed within 2 years.

EAST GERMANY-AUSTRIA: Both countries signed an agreement on environmental protection which includes an increase in information exchange.

AUSTRIA-EAST GERMANY: An Austrian-West German industrial consortium won in the bidding for the modernization of a petrochemical plant in Schwedt, East Germany. The Austrian state industrial concern, Voest-Alpine, will get 60 percent of the contract, the rest will go to Linde A.G. of West Germany.

EAST GERMANY-BRAZIL: On the basis of an agreement on the exchange of television programs between the television networks of both countries, Brazilian entertainment programs will be shown in East Germany, and German sport programs on Brazilian television.

U.S.-USSR: Caterpillar Tractor, an American concern that produces heavy machinery, will supply the USSR with 200 tractors and 39 pipe-laying machines, total value, $80 million. These machines will be supplied in the first quarter of 1986.

FRANCE-USSR: The Soviet central bureau, Avtopromimport, has ordered an up-to-date system, which will completely modernize the plants of the Moscow factory that produces internal combustion engines. Renault is the seller, and the value of the system is 457 million francs. The contract will be fulfilled in 1987.

YUGOSLAVIA-TURKEY: The Yugoslav firm, Elekom, sold Turkey railroad control and signalling systems which will be installed on one of the internal rail lines.

YUGOSLAVIA-SUDAN: A vehicle producer known in Poland, the factory, Tam, in Maribora, will supply Sudan with 43 heavy trucks for the transport of foodstuffs sent to Sudan by the Arab countries to aid Sudan in its disastrous drought. The value of the Yugoslav contract is $3 million.

AUSTRIA-BULGARIA: The Sofia department store, ZUM, will be equipped with modern Austrian equipment that will facilitate serving customers and provide faster service. The firm, Umdasch Laden-Einrichtungen, is the supplier.

ITALY-EAST GERMANY: The concern, Montedison (Italy), signed a 5-year cooperative agreement with East Germany. According to this agreement, Montedison will sell chemical products to AHB Chemie Export-Import and will buy East German products. The agreement also covers transfer of technology, scientific exchange, and the possibility of building plants in East Germany.

HUNGARY-AUSTRIA: With the mediation of the Chemolimpex central office, the Hungarian firm, Medikemia, and the Austrian firm, Spray Color, signed an agreement for Medikemia to sell dyes to Austria to be used in producing aerosol packs.

GREAT BRITAIN-BULGARIA: Discussions between representatives of Bulgarian industry and contractors from the British firm, John Brown Engineers and Constructors bore fruit in the signing of an agreement for cooperation in the building of a factory to produce enzymes for the food industry and for pharmaceutical use. The factory is to be build in Katuniza near Plovdiv under the supervision of British specialists. Other western enterprises are expected to participate. The cost of the project is preliminarily estimated to be from £20 to £50 million.

RECENT CEMA FOREIGN TRADE DEALS

[Warsaw POLITYKA in Polish No 40, 5 Oct 85 supplement POLITYKA EKSPORT IMPORT No 19 p 4]

[Text] NETHERLANDS--CZECHOSLOVAKIA: The Czechoslovak radio and television manufacturer "Tesla" has signed an agreement with the Dutch concern "Philips" for the purchase of compact disc players and video recorders intended for the Czechoslovak market. "Tesla" plans to shortly begin assembling "Philips-2000" video recorders and compact disc players to which particular parts are to be supplied by the Dutch.

DENMARK-KOREAN PEOPLE'S DEMOCRATIC REPUBLIC: Danish firm Flexpan has received an order for a delivery of equipment and machinery for a cement plant which is to be built in Phenian. The contract is valued at 65 million Danish crowns.

BULGARIA--GREAT BRITAIN: British concern APV International has entered into an agreement with the newly created Bulgarian enterprise "Bioinvest" in the area of cooperation of the "joint-venture" type. The common enterprise of the two firms created in Sofia plans to sell British biotechnological products in Bulgaria. This is the first "joint-venture" agreement between Great Britain and Bulgaria which resulted in the opening of an enterprise on Bulgarian territory. The British side owns 51 percent of the enterprise. Until now, APV has invested 100,000 pounds in this venture.

USSR--USA: The American firm Medical Technology Development Corporation Ltd., a subsidiary of the British firm "Eurdens," has purchased from the USSR a license for production of ellastic silicon-crystal eye lenses which has been perfected by the Moscow Institute for Eye Microsurgery. The same firm has previously purchased from the USSR a license for a method of sharpening of diamond knives used in microsurgery.

YUGOSLAVIA--AFRICAN NATIONS: The Yugoslav export-import enterprise "Jugoexport" will soon open a trade bureau in Dar-es-Salaam which is to be oriented towards promoting Yugoslav processed goods and increasing opportunities to purchase Tanzanian natural products (cotton, sisal, leather.) "Jugoexport" has 10 trade representations in developing countries, and export turnover is expected to reach 89 million dollars this year. "Jugoexport's" latest venture is its participation in the building of a plant in Gabon as a partner of the West-German firm "Salzgitter." The contract is valued at 2.5 million dollars.

BRAZIL--USSR: At a cost of 25 million dollars the USSR has purchased a large quantity of instant coffee. The lot of 28 million 100-gram jars will soon hit the Soviet market.

USSR--SWEDEN: Trade clearing between Sweden and USSR will be made in ECU's (Curopean Currency Unit). Sweden is the first country outside of the ECM which will use ECU's in trade with Eastern Europe.

COUNTERPLANNING INSTRUCTIONS 1986-1990 ISSUED

Prague HOSPODARSKE NOVINY in Czech No 51/52, 1985, p 6-7

[Unattributed article: "Worker Participation in Plan Formation; Guidelines for Counterplanning Implementation 1986-1990"]

[Text] We are publishing here Guidelines for Implementing Counterplanning, 1986-1990, which has been issued by the State Planning Commission [SPK] and the federal Ministry of Labor and Social Affairs [FMPSV] under agreement with the Central Council of Trade Unions, the Czech Planning Commission and the Slovak Planning Commission.

The adopted Principles of the CSSR Government and the URO concerning worker participation in the formation, implementation and controlling of the fulfillment of 5-year and annual economic and social development plans (CSSR Government Resolution No 270/1985) provide for the development of counterplanning as one of the basic forms of worker participation in management. For this reason a joint task of managerial and union organizations is to mobilize and utilize the creative energies, talents, knowledge and experience of worker collectives to uncover underutilized internal capacities for the improvement and fulfillment of, primarily, qualitative plan indicators, for increasing the efficiency and quality of all work, all in the interest of achieving national objectives.

Counterplanning is a technique for the formation of annual plans and is practiced in economic organizations in all sectors, with most of the activity centered in the internal divisions of these organizations. It is closely related to the application and further development of internal enterprise khozraschot.

In the interest of a unified approach by managerial and union organizations at specific levels of management the following guidelines are being issued to clarify the application of counterplanning.

I. The Objective of Counterplanning

1. Development of an annual plan using counterplanning is organized within the context of the resources, constraints, and restrictions established in state implementation plan for 1986-1987 and its breakdown for organizations

of the central link in management and for other organizations, as well as the restrictions set for 1988-1990 by the 5-year plan, and in some cases by the guidelines for drafting the state implementation plan [hereafter referred to as guidelines].

The basic principle is that when the resources requested in a counterplan proposal (including raw materials, other inputs, and products allocated at the level of the state plan, imports and investments) exceed those available a supervisory agency may adopt the counterplan only if the necessary materials can be procured from an organization's internal resources. For other raw materials, other inputs and products (the so-called items allocated at the level of central agencies, organizations in the middle ranks of management, and nonallocated resources) increased requisitions by organizations and agencies in the middle ranks of management are procured within the context of supplier-consumer relations. Any conflicts that may arise are resolved at the appropriate level of management, the highest permissible level being central sectoral organizations.

2. The objective of counterplanning is the more efficient valuation of inputs, the achievement of greater production efficiency, and more efficient construction and service activities. The focus, that is, is on the qualitative aspects of the capital replacement process and especially on a reduction in the material, energy and import intensiveness of production, on increasing labor productivity, the rapid implementation of R&D findings, the improved utilization of inventories and capital assets, on increasing use values and the quality of products, on increasing the efficiency of export production as well as domestic production, and on reducing completion times in the construction sector. In nonindustrial sectors the focus is on better satisfying public needs, with tasks specified for specific organizations by supervisory organizations.

3. The aggregate expression of improved qualitative indicators is an increase in adjusted value added or another indicator used to establish standards for wages resources (hereafter the "determinant indicator"), assuming that the following conditions hold true:

If an increase is being proposed in the determinant indicator by means of a reduction in materials costs, the only sort of acceptable counterplan is one where any increase is proportionally incorporated in profits. (An increase in the determinant indicator after deductions of amounts related to increased wage costs and contributions to social security should, for all practical purposes, be incorporated in profits).

The Principles of the CSSR Government and the URO provide that:

"If adjusted value added is increased by means of increased production or output, then a counterplan is considered productive if it also proposes:

a) in industrial sectors, a corresponding increase in export deliveries to the USSR and nonsocialist countries, to consumer goods inventories, or an increase in revenues from the general public (for local industry and production cooperatives). Increased output earmarked for production consumption or for the formation of readily marketable inventories is evaluated in terms of the final point of this section (the Czechoslovak State Bank participates in the case of inventories); a precondition for the inclusion of such proposals in a counterplan will be already signed agreements for the marketing of this output. Whether or not this precondition has been met will be evaluated during the annual management analysis;

b) in agriculture, an increase in required contractual deliveries to the food industry, to consumer goods inventories and for export;

c) in construction, adherence to or improvements in designated indicators for regulating noncompleted construction;

d) in other sectors an increase in required output as specified by supervisory agencies.

With these objectives organizations, agencies of the central ranks of management, and central agencies specify the ways by which they will attain the needed improvements."

The above cited measures pursue the following objectives:

--assuring that increases in production are concentrated in priority use areas, which include exports to the USSR or to nonsocialist countries or deliveries to consumer goods inventories (in local production enterprises and service organizations and in production cooperatives revenues from the general public are understood as net services provided to the general population),

--assure that production in excess of the plan and designated for production consumption be marketed in some way so that there will not be an undesirable increase in inventories of finished goods.

4) When a proposed counterplan has been presented a supervisory economic agency studies the proposed contributions to be achieved by an increase in the determinant indicator in accordance with established conditions. If these conditions are not met the proposed counterplan is rejected.

II. Period of Counterplan Organization

1. In 1986-1987 counterplanning is being organized in conjunction with the upgrading of the tasks contained in the breakdown of the state implementation plan for agencies in the central ranks of management and for organizations in their economic plans. The final deadline for the adoption of counterplans is the same as for the approval of a managerial play by a supervisory agency (usually by 15 February of the plan year).

2. For 1988-1990 counterplanning will be organized as an upgrading of tasks set for the year in question by the 5-year plan (guidelines) in drafts of the annual plans of organizations and agencies of the central ranks of management

(usually available between July and September[1] of the previous year). In the aggregate, adopted counterplans of organizations and agencies of the central ranks of management are incorporated into the plan drafts submitted by sectoral central agencies. [1](September is the deadline for finalizing plan relationships between economic reduction units and a central sectoral agency).

3. In agriculture, the food industry (including bakeries managed by national committees) and in construction operations (including local construction companies) because of their specific conditions, counterplanning is organized even for 1988-1990 before the deadline for organizational plan improvement (February), which means that the exception made for the Seventh 5-Year Plan will extend to these later years as well.

4. All additional upgrades adopted after established deadlines are not recognized as counterplans, with all of the consequences that this implies.

III. Economic Incentives for Employees

Counterplanning is connected with an improvement in economic incentives for employees designed to stimulate their interest in the uncovering and exploiting of underutilized capacities for the improvement of established performance targets. In line with existing regulations[2] [2](Decree No 98/1985, Sbirka Zakonu, concerning the allocation of resources, and its guidelines), the following considerations are applicable to economic incentives:

1) In organizations where standards are set in the form of a share of wage resources based on a determinant indicator (referred to as a "level standard") the organization which includes in its plan an upgraded version of the determinant indicator gains the right to wage resources in their full amount based on the existing standard (a 1 percent increase in adjusted value added, for instance, means an increase in wage resources also by 1 percent).

The adoption of a counter plan is more advantageous for the entire collective of employees than is the exceeding of the determinant indicator during the period of plan implementation, when the planned volume of wage resources is increased according to a standard that is adjusted by a recalculation coefficient that is substantially less than 1.

In cases of failure to meet the determinant indicator in the plan, or of failing to achieve it during plan implementation, an organization has a right to wage resources based on established standards (a 1 percent decrease in wage resources for each percentage point of underfulfillment of the determinant indicator).

2) In organizations where standards are applied that tie increases in wage resources to increases in the determinant indicator (hereafter the "growth standard")[3] [3](This standard is defined as a percentage increase in wage resources for each 1 percent increase in the determinant indicator.) this standard is not reduced if determinant indicator targets are exceeded during plan implementation (without a previous counterplan; upgraded tasks in a

counterplan is accorded no advantage over task overfulfillment during the year). In such cases an advantaged growth standard can be established for counterplanning that is used for calculating wage resources due when an established increase in the determinant indicator is upgraded. (An advantaged growth standard is used primarily in those cases where the use of a standard growth norm in the counterplan stage would put these organizations at a disadvantage in comparison with an organization using a level standard). At the same time a percentage increase target for the determinant indicator is set for the organization. The advantaged growth standard is used whenever this target figure is surpassed.

Calculating planned claims on wage resources requires that the status of the determinant indicator and wage resources be determined under comparable conditions, i.e., in the organization, methodology and prices of the plan year (only balanced prices are included). The starting point of the determinant indicator for 1986 and 1987 is the performance of the previous year and, for preparations for the 1988-1990 plans the projected figures for the previous years. The starting point for wage resources is their useable volume, which corresponds to the starting point of the determinant indicator without supplements or deductions.

a) If a decline is proposed in the determinant indicator below its starting point, there will be a linear reduction in the starting point of wage resources (i.e., a percentage point for percentage point decline);

b) If an increase in the determinant indicator is proposed that is less than the established increase, or the established increase is only maintained then the starting point of wage resources is increased by an amount calculated with the aid of the established growth standard (see the model in point b) of the example);

c) If an increase is proposed in the determinant indicator that is higher than established the increase is divided into a part corresponding to the established increase and a part by which the counterplan is increasing this established level. The starting point of wage resources is thus increased by an amount calculated by the following model:

$$\frac{VZ \cdot SR \cdot PN + VZ \cdot (NR - SR) - ZN}{100},$$

where:

VZ is the starting point of wage resources (in korunas);
SR is the established increase in the determinant indicator (in percent);
NR is the proposed increase in the determinant indicator (in percent);
PN is the growth norm (in fractions of a percent);
ZN is the advantaged norm (in fractions of a percent).

In the approval of annual plans the approach is the same with the difference that in 1988-1990 the starting point for the determinate indicator will be the performance of the previous year and the volume of useable wage resources derived from this (exclusive of supplements or deductions).

d) If during plan implementation the determinant indicator is not fulfilled the planned volume of wage resources is reduced in a differentiated manner depending on their origin. This means that they are first reduced in a ratio equal to the counterplan for the determinant indicator, then in accordance with the growth standard (up to the level of the determinant indicator for the previous year), and finally in a ratio of 1:1 (when the determinant indicator declines below its level of the previous year).

The above approach offers, just as with the application of a level standard, economically justified wage growth. The differentiated reduction in the volume of wage resources when the determinant indicator is not fulfilled pursues the objective of not weakening the interest of work collectives for adopting counterplans that utilize a growth standard.

The planned wage resource volume is reduced by a maximum of 8 percent regardless of whether a level or growth standard is used. This reflects the need to assure economically justified wage development and increased joint responsibility of worker collectives for economic performance.

Economic incentives related to counterplanning are guaranteed, provided the conditions are met. Supervisory agencies have the responsibility of assuring that all incentives and penalties are clearly and effectively applied, even though they do not propose a counterplan and some of their subordinate agencies do upgrade their targets with counterplans. Because of this situation these supervisory agencies set aside appropriate allocated reserves of wage resources to covering the claims of counterplanning organizations, and administer the wage resources reductions at organizations that do not meet their targets.

The consistent application and effectiveness of counterplanning requires an improvement in the economic incentives provided for those workers and collectives which have assisted in achieving improved economic performance. Organizational management, by agreement with the appropriate union agency, should modify the regulations for awarding premiums and bonuses in such a way that incentives are provided for those collectives and individuals who have played a role in the adoption and implementation of a counterplan.

The upgrading of organizational objectives through a counterplan is also related to the possibility for increasing annual bonuses for managers to the extent and under the conditions established in the decree of the FMPSV[4] (file no. 513-21258-5131, 051185 concerning the granting of annual bonuses to economic organization managers).

It should also be mentioned in relation to economic incentives that when labor productivity increases are achieved by reducing the number of employees at a given organization, that organization retains the volume of wage resources dictated by the determinant indicator and the established wage resource standard.

IV. A Final Regulation

Central agencies, by agreement with the appropriate agencies of the trade unions, specify the principles of counterplanning within the context of a branch in such a way as to more precisely focus the objectives of counterplanning, including the conditions for employee economic incentives. They may set these objectives for an entire 5-year period. Supervisory economic administrative agencies operate in a similar manner, in that they agree with appropriate union agencies to set more detailed objectives for counterplanning, including the conditions of economic incentives for employees in subordinate organizations. For 1986-1987 this is to be done no later than during the formulation of the annual plan, while for 1988-1990 it should be done no later than at the beginning of work on the annual plan draft. In nonproduction organizations supervisory economic administrative agencies specify counterplanning tasks so as best to reflect their goals.

In the interest of the consistent application of counterplanning state economic organizations, in agreement with enterprise or plant revolutionary trade union movement [ROH] committees, adopt their own regulations for counterplanning including the conditions of economic incentives for internal enterprise divisions. At the same time they assure the successful implementation of these regulations by linking counterplanning effectively to internal enterprise khozraschot and the compensation of work collectives according to merit.

An example follows of the application of counterplanning to the allocation of wage resources by means of a growth standard (for 1986-1987)

Breakdown is established

a) growth standard is a 0.3 percent increase in wage resources for every 1 percent increase in adjusted value added,

b) a growth rate target for adjusted value added is set at 5 percent; when this is exceeded an advantaged standard is implemented;

c) the advantaged norm provides for a 0.8 percent increase in wage resources for each 1 percent increase in adjusted value added over 5 percent.

It was determined that the starting point of the past year (after adjustments and transfers to comparable conditions) was adjusted value added=1000 and wage resources=400.

The enterprise proposed the following levels for adjusted value added [UVV]:
a) 980
b) 1040
c) 1070

Upon plan implementation it was found that actual UVV was 1060.

Comparison of specific variants of claims on wages

Key: MP_{PL} -- planned wage resources
MP_S -- actual wage resources
VZ -- starting point for wage resources
NR -- proposed increase in determinate indicator
PN -- growth standard
ZN -- advantaged standard

a) UVV PLAN 980

$$MP_{PL} = VZ + \frac{VZ \cdot NR}{100} = 400 + \frac{400 \cdot (-2)}{100} = 392$$

UVV ACTUAL 1060

$$MP_S = VZ + \frac{VZ \cdot NR \cdot PN}{100} = 400 + \frac{400 \cdot 4 \cdot 0.3}{100} = 407.2$$

b) UVV PLAN 1040

$$MP_{PL} = VZ + \frac{VZ \cdot NR \cdot PN}{100} = 400 + \frac{400 \cdot 4 \cdot 0.3}{100} = 404.8$$

UVV ACTUAL 1060

MP_S = 407.2 (according to same model as in variant a))

c) UVV PLAN 1070

$$MP_{PL} = VZ + \frac{VZ \cdot SR \cdot PN + VZ \cdot (NR-SR) \cdot ZN}{100} = 400 + \frac{400 \cdot 5 \cdot 0.3 + 400 \cdot (6-5) \cdot 0.8}{100} = 412.4$$

UVV ACTUAL 1060

$$MP_S = 400 + \frac{400 \cdot 5 \cdot 0.3 + 400 \cdot (6-5) \cdot 0.8}{100} = 409.2$$

From the foregoing it follows that in a case when the objectives of a counterplan are not fully met, but the achieved performance is more than the pre-plan projection, an enterprise which entered into a counterplan will receive certain advantages over an enterprise that chose not to submit a counterplan, or which adopted a lower plan and then exceeded it during implementation.

INCOME-CONSUMPTION DEVELOPMENTS 1970-1983 DISCUSSED

Prague STATISTIKA in Slovak No 11, 1985 pp 494-504

[Article by Michal Majtan: "The Development of Personal Income and Expenditures of the Population of the SSR"]

[Text] Aggregate personal income of our population represents the main source--the means and mechanisms--of the processes of distribution, which even in socialism serves primarily to satisfy personal consumption of the population and services for which the population pays. Its development and volume in a specific period depend on the structure of the population, economy, labor input, and achievements, and on the decisions of our central political and state agencies in the sector of planned managements of the processes of distribution of disposable income (wages, finances, and prices).

The development of the nominal as well as of the actual volume of aggregate personal incomes is determined by decisions which affect, inter alia, in particular the proportion of individual and social distribution of NI and the sphere of primary and secondary distribution and redistribution of NI. This is linked with specific individual decisions which affect in final [sentence incomplete] individual and publicly compensated nonproduction consumption. They also include decisions which formulate the relation between the policies in the sector of rewards and the policies in the social sector.

See Table 1 for the development of aggregate personal incomes in the SSR as well as of main types of personal cash incomes in the context of the data for the CSR and CSSR.

Certain general conclusions may be drawn from the data in Table 1. First of all, it may be noted that average annual rates of growth of personal incomes in the SSR and CSR gradually declined. Thus, for example, in the SSR they amounted in 1971-1975 on the average to 6.5 percent annually, in 1976-1980 to 5 percent, and in 1981-1983 to 3.8 percent. This is connected with the growth of the base as well as--and particularly--with the decelerating rate of growth of gross domestic product, while the growth of average personal incomes (in per capita conversion) was naturally lower in accordance with the growth of the population (particularly in the SSR).

Table 1. Development of Personal Cash Income

		1970	1975	1980	1981	1982	1983	1975/1970	1980/1975	1980/1983	1983/1970

Secondly, it may be noted that average annual rates of growth of total personal incomes were relatively very high even in per capita conversion. They were higher than the rates of growth of gross domestic product (in constant prices). This was then necessarily reflected after a certain lapse of time in a slower development of actual earnings of our population.

Transfer payments (in 1971-1975 also other incomes in the form of interest and premiums on bank deposits, insurance benefits, compensation for travel and moving expenses, etc.) acted as a factor accelerating the growth of total personal earnings. The growth of transfer payments was thus connected with higher children's benefits and with higher old-age and other benefits. They increased especially after 1 January 1976 and after 20 July 1979 due to the compensation of a relatively higher rate of growth of retail prices of consumer goods and services.

In general, our socioeconomic policy, including the policy in the sector of rewards and prices, was enforced very deliberately. Numerous measures ensured a realistic and basically, also nominal harmony and proportionality of the development of efficiency, creation of NI, and rewards based on performance. This laid the groundwork for a fundamentally balanced nominal development of offer and demand in our domestic market of consumer goods and services.

Different rates of growth of individual basic types of personal income were also appropriately reflected in the development of the structure of total personal earnings (Table 2).

Table 2. Development of the Structure of Per Capita Cash Income in the SSR (percent and points)

Indicator	1970	1975	1980	1982	1983	Change in 1983 as compared with 1970
Total cash incomes	100.0	100.0	100.0	100.0	100.0	--
Of which incomes:						
--wages	71.7	69.8	68.8	68.1	68.3	-3.4
--transfer payments	18.0	17.6	18.8	19.5	19.6	+1.6
--from loans	3.2	4.1	3.8	3.8	3.7	+0.5
--other	7.1	8.5	8.6	8.6	8.4	+1.3

In the above-mentioned period the primary tendency in evidence was the ongoing decline of wages and a growing share of transfer payments. The development of the above trend stems mainly from the accelerated growth of transfer payments in conjunction with their accelerated growth after the adoption of decisions on compensation and subsidies by our central authorities in the sector of children's, old-age, and other benefits. Within that framework, the overall system of aid to families with children was changed by the transition to a monetary policy in the form of higher children's benefits against the form of discounts, or cut rates of sales tax in prices of consumer goods for children.

The development of the structure of personal earnings was further significantly affected by a slower rate of growth of salaries and wages, which followed from the slower rates of growth of NI and from the enforcement of restrictive policies in the sector of creation and use of funds for performance bonuses (especially in the nonproduction sphere).

The sector of personal earnings from loans granted by state savings banks is developing in an interesting way. As compared with 1970, their share in 1975 rose from 3.2 percent to 4.1 percent. In the following years the share of loans declined or stagnated, not because of the restrictions in the plan, but rather because of the population's diminished interest in loans. This was the consequence of the growth of personal income as well as of the growth of personal savings and of relatively high interest rates on certain types of loans.

In general, the main trends in the development of personal savings were essentially identical in the SSR and in the CSR, while the more rapid rates of growth of personal income in the SSR stem in particular from the difference in the structure of the population (the share of children and the consequent growth of transfer payments) and in a more rapid rate of growth of production and outputs.

If we compare the development of personal income in the SSR and CSR, we may note that in the period before 1980 the level of the SSR in absolute and relative expression was rising. Thus, appropriate indicators were converging. The data in Table 1 document the decrease of the absolute difference in per capita conversion from Kcs 3,130 in 1970 to Kcs 2,423 in 1980. In relative expression this meant 18.7 percent in 1970 and only 10.1 percent in 1980. The share of total personal income in their total volume rose from 27.3 percent in 1970 to 30.3 percent in 1980 and to 30.7 percent in 1983. For comparison, I should like to mention that the share of the SSR population was 33 percent in 1983.

The process of convergence of the SSR and CSR in the area of personal earnings began to stagnate after 1980. As mentioned above, the share of total personal income in the SSR in its total volume in the CSSR increased from 30.3 percent in 1980 to 30.7 percent in 1983, however, not enough to reduce the absolute and relative difference in per capita conversion. The difference in average per capita cash incomes even began to rise from Kcs 2,423 in 1980 to Kcs, 2,733 in 1983, which in relative expression represented an increase in the difference from 10.1 percent in 1980 to 10.3 percent in 1983.

Of the (four) factors responsible for the difference between the SSR and the CSR in cash earnings in per capita conversion the most influential are wages and transfer payments, or those primary factors that affect their development. According to the data for 1983, the total difference in per capita incomes between the SSR and the CSR (not including interest on loans credited at the end of the year) is caused by the following factors (Footnote 1) (The total per capita difference is explained by conversion of the effect of individual factors per capita. This does not imply that every factor existing between the SSR and the CSR may be completely equalized.):

Factor	Difference in Kcs	Share of factor in percent
1. Factors leading to greater difference in earnings:		
--lower share of employees in post-productive age in total population	465	16.9
--fewer economically active persons of productive age	634	23.0
--lower incomes from pensions	712	25.9
--lower average wages of workers in the socialist sector (not including JRD [unified agricultural cooperatives])	726	26.4
--lower share of students in the population of productive age	144	5.2
--lower average cash earnings in the JRD and agriculture	93	3.4
--lower cash flow from the CSR to SSR, such as wages of workers leaving for employment in the CSR	187	6.8
--fewer foreign nationals employed in the SSR	82	3.0
--lower level of other incomes	312	11.3
2. Factors narrowing the difference in incomes		
--lower share of workers in the socialist sector in the total number of employees in the SSR national economy	-100	- 3.6
--different share of persons of productive age	-241	- 8.7
--higher incomes from health insurance in the SSR	-110	- 4.0
--higher per capita loans in the SSR	-152	- 5.5
Totals	2,752	100.0

While aggregating factors that affect the difference in personal income in the SSR as compared with the CSR, it was determined that the share of economic factors in the development was gradually declining. In 1975 the share of economic factors amounted to 44.5 percent; in 1983 it dropped to 41.7 percent.

Total difference in cash earnings may be further reduced by higher employment of housewives, by lower migration for work in distant areas, and especially by creating conditions to narrow the differences in the amount of wage earnings by increasing social productivity of labor and efficiency of production.

Historically, the differences in pension benefits are relatively objective. They are determined by appropriate regulations, a lower share of the elderly, and lower average old-age and disability pension benefits derived from lower average wage earnings in the past.

Per capita cash expenditures are a specific and at the same time, the most significant form of transacting a fundamental part of personal consumption and of services for payment offered to the population. The development of basic types of per capita cash expenditures appears in Table 3.

For cash expenditure of the SSR population it is characteristic that the share of purchases in stores (statewide) is nearly identical as the share of total personal earnings (or expenditures) of our population. After 1975 the share in savings increments was expanded; the average increase of per capita savings was higher in the SSR than in the CSR. Obviously, this reflects the process of creation of savings in conjunction with higher earnings, which had occurred in the CSR earlier. Other factors in per capita expenditures, in which the SSR holds a higher share than its share of the population, are payments of loans and procurement in JRD's. In addition to repayments of loans, all per capita expenditures in the SSR achieved higher dynamism than in the CSR.

In the above-mentioned period the share of incomes earned in the structure of personal incomes was in the range from 95.5 percent to 96.7 percent (Table 4).

Table 4. Development of the Structure of Personal Cash Expenditures in the SSR (in percent and points)

Indicator	1970	1975	1980	1982	1983	Change in 1983 as compared with 1970
Total personal cash expenditures	100.0	100.0	100.0	100.0	100.0	--
Purchase of goods in retail stores	67.7	66.8	65.2	64.4	64.3	-3.4
Procurement of products in JRD	0.3	0.5	0.3	0.3	0.3	0.0
Payments for services	12.0	12.0	13.3	13.1	12.9	+0.9
Taxes, customs duties, and levies	9.8	10.2	10.9	10.7	10.8	+1.0
Repayment of loans	2.9	3.1	3.4	3.4	3.8	+0.9
Change in the situation of savings	4.5	4.2	3.3	4.2	4.3	-0.2
Other expenditures	2.8	3.2	3.6	3.9	3.6	+0.8

Incomes earned were relatively more intensive especially in 1980 when the share of the change in the situation of savings amounted to only 3.3 percent, while in other years under discussion it was from 4.2 to 4.5 percent.

Among aggregated personal incomes the share of taxes, customs duties, and levies followed a basically ascending trend of development, particularly in conjunction with the increase of average income tax rates, which was due especially to the declining share of children in families, or to families without minor children. In conjunction with the increase in loans to the population, the share of repayments of loans to state savings banks increased. The share of other expenditures, primarily insurance payments to state insurance agencies, bets in the Sazka enterprise, etc., rose to a relatively major degree. A positive factor is that circumstance that the share of personal payments for services is increasing; however, the increase is due mainly to higher expenditures of the population for housing and for payments for communications (higher financial participation of the population in the financing of housing construction, and higher rates for communications).

In view of the greater share of all the above-mentioned basic groups of personal expenditures in total expenditures of the population, the share of the main item in personal expenditures--purchases of goods in retail stores--declined by 3.4 points. In 1983 its share in total personal expenditures was 64.3 percent. The main part of personal consumption is practically transacted in this fashion.

When comparing the development in the SSR with that in the CSR, one may note that due to higher rates of growth of personal earnings in the SSR, individual types of personal cash expenditures achieved higher rates of growth, but with that difference that while customs and levies in the CSR achieved higher rates of tax increase than of payments for services, in the SSR it was exactly the opposite, because of the more rapidly expanding services in the SSR and of lower taxation of wage earnings due to a higher share of children in families, a lower share of childless families, and a higher share of wages earned in the JRD's which are not subject to income taxes.

One of the specific indicators of realization of personal incomes (in the form of their expenditures) and of the living standard is the furnishing of households with durable goods (Table 5).

From the five types of durable goods listed here, the rate of equipment with four (except for passenger automobiles) in 1983 was 100 or more items per 100 households. In 1971-1983 the standard of furnishing in the SSR rose 1.4 times up to almost 300 percent (passenger automobiles). At the same time the ratio of the SSR to the CSR is essentially the same as in aggregated personal incomes. The rate of furnishings is lower--from 4 percent (refrigerators) to 24 percent (passenger automobiles).

See Table 6 for the effect of the changes in personal savings in the form of bank deposits and cash on hand.

In 1971-1983 total personal savings increased in the SSR almost 3.4 times and in the CSR 2.8 times. In per capita conversion the situation of personal savings in the SSR amounted in 1983 to more than Kcs 14,000, while the share of personal savings in the SSR was up from 26.2 percent in 1970 to 30.2 percent in 1983 (the share of the SSR in total population was 33 percent). Nevertheless, in per capita conversion the difference between the situation of savings in the CSR and in the SSR continued to grow in the above-mentioned

b) per capita in Kcs						
ČSSR	5 592	9 574	12 730	15 399	9 807	275
ČSR	6 033	10 170	13 235	16 069	10 036	266
SSR	4 639	8 311	11 683	14 044	9 405	303
ČSR — SSR	—1 394	—1 859	—1 552	—2 025	631	145
SSR/ČSR in percent	76,9	81,7	88,3	87,4	10,5	—

period by 45 percent. However, in relative expression the difference declined from 23.1 percent in 1970 to 12.6 percent in 1983. Although in comparison with the CSSR the difference in the situation of personal savings in the SSR in per capita conversion increased in the 1971-1983 period, the difference in relative expression was relatively greatly reduced. In 1983 the difference in personal savings in the SSR in per capita conversion represented in relative expression only slightly more (12.6 percent) than in personal incomes (10.3 percent), however, the absolute difference in the situation of per capita savings in the SSR was reduced between 1976 and 1980 as compared with the CSR (from Kcs 1,859 in 1975 to Kcs 1,552 in 1980). In 1981-1983 the difference rose again almost above the 1975 level (Kcs 2,025). The connection with the growth of absolute differences in personal earnings in the SSR (in per capita conversion) as compared with the CSR is evident (for details see Table 1). In general, the development of personal savings in the form of bank deposits and cash on hand is in proportion with the development of aggregate personal earnings.

The data on the development of personal cash income and expenditures confirm in their way the statements made at the 16th CPCZ Congress (in the report on the party's activity and the development of society since the 15th CPCZ Congress): "We have every right to note with pride that the task to overcome the differences existing historically in economic, political, and cultural conditions of our nations has been essentially fulfilled."

STATISTICAL DATA STRESS ROLE OF KEY TECHNOLOGIES, COMBINES

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 20 Jan 86 p 4

[Article by Gz. datelined Berlin 19 Jan: "GDR Statisticians Are Satisfied" /Methods of Computation Unclear as Always/ The Importance of Combines]

[Text] If one follows regularly what can be read daily in letters to the editor and self-imposed obligations by enterprises, one must come to the conclusion that until mid-April there is no other topic in the GDR except the "worthy preparation" of the 11th Party Congress. It is not difficult for GDR statisticians to use the label "particularly successful" for the past year. The growth rate, regardless of how it was computed, appears satisfactory, and the SED is also content with performances in agriculture. 1985 was the last year of the 5-year plan 1981 to 1985; but since the figures for December are only tentative, it is not certain whether the goals of the 5-year plan were achieved. 1982 was a bad year, particularly because of low agricultural yields; the shortfalls may have been partially made up.

Since there exist no price statistics whatsoever, it is not possible to assess on an economic policy basis the drop in the growth rate from 5.5 to 4.8 percent of "produced national income;" of importance is the increase in work productivity from 7.7 to 8.4 percent, surely a result of the efforts of industrial combines to lower their costs and to economize with materials. GDR statisticians claim that real income has risen by 5 percent (in 1984, an increase of 4 percent was reported), but no one knows how this increase was computed. The increase in the population's net monetary income of 4 percent is roughly the same as in the previous year. The supply of motor vehicles for the population (allocation rate per 100 households) rose from 42 to 45 percent; by now, almost every household has a refrigerator and a washing machine. Manufacture of color television sets and freezers rose strongly. The report notes that the population was supplied more reliably with "the thousand little things;" there was progress in the supply of spare parts, also.

What is new in the organization of the voluminous data report is the fact that the subject "science and technology" heads the list. For some time now, so-called "key technologies" have become a constant topic in GDR publications. In trade with the "capitalist industrial countries," the GDR has maintained and enlarged its position on foreign markets, particularly through "more effective selling and marketing work" and the increased capability of many combines to react to new demands of foreign markets, to make the production structure correspondingly more flexible, and to make new results of scientific-technical progress production effective in a very short time.

From the figures one can deduce that ever greater tasks are being given to industrial combines, "the backbone of proven socialist planned economy." It seems, however, that extensive division of labor, characteristic of modern industrial states, is becoming less so. For instance, the combines must increasingly make up the shortfall in modernizing their installations through construction of their own rationalization means; they are to produce more consumer goods and develop their own software for computers and robots which are increasing in use.

The statistical report, three-and-a-half pages in the SED central organ NEUES DEUTSCHLAND, names a great number of enterprises which had fulfilled their obligations; the list starts with the big, well-known, and again praised, combines such as "Carl Zeiss Jena" or the petrochemical combine in Schwedt, down to the baked goods combine in Gera and the Auerbach section of the dairy in Plauen/Vogtland which increased its production of soft and hard cheeses. It is also pointed out that the production of seagoing and coastal vessels was increased by almost 25 percent. The ships built in GDR shipyards are mostly delivered to the Soviet Union.

As has been noticed for years, the trend continues to build fewer new apartments and to use the funds and labor instead for modernizing a greater number of old apartment buildings. Overall, construction activities have increased further. A special section is devoted to the capital of the GDR; in East Berlin about 33,400 apartments were newly constructed, almost 10,000 more than in the previous year. As in past years, savings deposits rose by almost 6 billion Marks.

Foreign trade figures are sparse as always. Turnover, counting imports and exports together, rose from 174 to 180 billion units of account. In foreign trade with socialist and non-socialist countries a "significant export surplus" was achieved in the amount of 7 billion Marks (6.4 billion Marks in the previous year). Two-thirds of GDR foreign trade is effected with partners in the socialist economic area; the foreign trade turnover with the Soviet Union rose by 4 percent to 70 billion units of account.

DLUGOSZ DEFENDS ECONOMIC SITUATION

Warsaw RZECZPOSPOLITA in Polish 12 Feb 86 p 3

[Interview with Stanislaw Dlugosz, deputy chairman of the Planning Commission of the Council of Ministers, by Tomasz Bartoszewicz; date and place not specified: "Poland Wants to Be a Trustworthy Partner"]

[Text] Recently a significant number of articles have appeared in the Polish press and abroad that place question mark over the condition of our economy and the ability of Poland to extricate itself from the obligations it has assumed with respect to its foreign partners. In connection with this, a journalist from RZECZPOSPOLITA arranged an interview with Stanislaw Dlugosz, deputy chairman of the Planning Commission of the Council of Ministers.

[Question] Mr. Minister, some publications have expressed the idea that our economy has entered a phase of stagnation. Is it really this bad?

[Answer] There are even statements suggesting that we are in a phase of "degradation." The answer to this question is quite difficult. In many centers even an objective presentation of the condition of our economy engenders charges of practicing a "propaganda of success" in the style of the 1970's. Let us try, however, to consider some irrefutable facts.

I would begin with the fact that one of the few areas of consensus of the majority of economists and journalists in our country is that participation in international economic cooperation is an indispensable and advantageous factor. By-passing a small number of exceptions that have a decidedly pathological character, everyone agrees that export is the factor that will drive the economy. In the basis of this consensus, in foreign trade, we should present ourselves as an interesting partner with whom it would simply pay to cooperate. This, then, is a concept of adequately presenting our capabilities and trump cards, speaking openly about deficiencies without making ourselves out to be the sick man of Europe. At the same time, we must take into account that what we say is analyzed in detail both in the West and in the East... In the next few years, the competition in the international markets will increase, and in our community, competition for access to the USSR market.

[Question] Are you saying, sir, that our foreign partners are disturbed by certain signals?

[Answer] First of all, to both Polish public opinion and our foreign partners, I would like to say that the idea of drastic deterioration in the state of our economy is greatly exaggerated. Neither is there any basis for the statement that the economy cannot be "controlled" toward development.

[Question] What specific arguments are put forth by the critics and how would you reply to them?

[Answer] The ranking of our "weak points" depends to a substantial degree on the world view of the writers. Together with objective, but critical analysis, we meet with the "sensational," intended to win the applause of certain groups in Poland or abroad.

[Question] Let us begin, perhaps, with the question of being "uncontrollable."

[Answer] Evidence of "controllability" of our economy are at least the results of our cooperation with the CEMA countries, also the increase in agricultural production. Should this increase be ascribed exclusively to favorable climatic conditions, or is it also due in no small degree to the conscious and effective actions of the state agricultural policy? Some writers move toward questioning the entire postwar achievements of our country, maintaining that "Communism has brought only misfortune to Poland." I do not want to go into particulars, so I will only recommend reading the data provided by the Central Office of Statistics in the small statistical annual No 1938 for the current period. Please look at least at such areas as unemployment, illiteracy, yield of grain, or industrial production.

[Question] These are so-called obvious facts. Only persons blinded by hatred would negate progress in relation to the prewar period. This is, however, not adequate proof for progress over the more than 40 years since the end of the war.

[Answer] Obviously. For the sake of order, however, I noted that we can hear even such voices. Much more frequently we meet with criticism of the achievements since 1981. Some writers say that there is a steady regression and that we will not be able to reach the level of the 1970's. I have no intention of claiming that we have already caught up with all the arrears of the crisis. But there is no way that progress can go unnoticed. The facts are evidence of progress. Let us take, for example, an area that has been criticized, such as the book market. In 1975, during the peak of the boom, 143.9 million books and brochures were published. In 1980, at the beginning of the crisis, 147.1 million, and in 1984, 229.8 million. The state of our hospitalization is very much criticized. Let us count the number of beds in hospitals. In 1975, there were 188,400; in 1980, 200,000; and in 1983, 208,500. A third example: we are experiencing inadequate supplies of television sets, especially the black and white. Let us consider the number of viewers. In 1975, there were 6.5 million, in 1980, 7.9 million; and in 1983, more than 8.5 million.

[Question] But this is not proof of complete elimination of the results of the crisis.

[Answer] I did not intend it to be such proof since that would be untrue. I only wanted to convey the idea that during the years from 1982 to 1985 our country experienced definite development in some areas, although it was not, to be sure, as rapid as we might have wished.

Let us return, however, to the critics. They make a great deal of noise about the weaker results of our management in 1985. No one, especially among responsbile people, questions the fact that the past year was worse than our plan anticipated. But if we want to evaluate the matter objectively, we must look at the developmental trends. Here, in comparing the dynamics of growth in industrial production in specific quarters, we see the following picture: the first quarter of 1985 compared to the first quarter of 1984, 100.7; the second quarter, 103.7; the third quarter, 104.0; and the fourth quarter, 106.7, respectively. The dynamics were toward an increase. In the same way, we cannot speak of stagnation in 1985. If, however, we treat the matter more broadly, then we have, of course, carried out the three-year plan in the basic indicators despite external conditions that were not always favorable, and relations with the capitalist countries that were decidedly unfavorable. Even western experts, who cannot be accused of having political sympathies for Poland, stated in a report published at the end of 1985: "Beginning with the second quarter of 1982, there has been a revitalization of economic activity."

[Question] Since we are speaking of the results for 1985, a dark point is, perhaps, export to the second payments area.

[Answer] This is quite true, but this point is not as dark as it is sometimes presented. It is, moreover, an area on which our critics concentrate their attention. They accuse us mainly of a lack of pro-export tendencies in our economy.

[Question] And is this not true?

[Answer] I would be the last person in Poland to express satisfaction with the level of export to both payment areas. First of all, we have too little participation in industrial production for export, in production in general, and by the same token, the structure of export is not commensurate with our economic potential. Too few enterprises are interested in expanding to foreign markets. This unsatisfactory state of affairs must not, however, hide objective facts. First, since the beginning of the 1980's, we have been faced with objectively unfavorable conditions in trade with capitalist countries (weak relations, increasing tendencies toward protectionism, and finally, an unfavorable political climate). Second, in its assortment, our export to the second payments area was equal (in constant prices) to the highest export level in 1980, but we must remember that the record results of 1980 were achieved as a result of the decision to remove a significant amount of goods from the internal market and from internal supplies.

[Question] In value, however, we have a distance to go to the $8 billion that we obtained from export in 1980.

[Answer] This is true, but the export effort must be evaluated through the prism of volume. Also, we must take three factors into account. First, I would list the drastic drop in imports from capitalist countries through no fault of ours. In the material sense, today we import approximately 50 percent as much as in 1980. Neither can we omit the open problem of great losses, in the order of several billion dollars, that our economy suffered as a result of restrictions. Finally, we must remember that in the years 1981-1985, we were granted $7.5 million in credit and have paid our creditors more than $13 billion.

These three factors indicate the degree of encumbrance of our national economy, which in spite of this, was able to return to trends toward development. This was done, however, at a definite cost, and I would like to mention yet another proinflation factor. The fact that our economy was capable of this effort is the best evidence of its controllability and of our readiness for complete normalization of financial-economic relations with capitalist countries. Nevertheless, there is no suitable response from the other side.

[Question] Undoubtedly, we were encumbered with paying interest on credits to western creditors. At the same time, we did benefit from credits from the USSR.

[Answer] Up to 1980, our trade with socialist countries was in balance. In the last few years, we did take advantage of credit assistance, principally from the USSR. These are credits under very favorable conditions (low interest rates). This situation will persist for two or three years, then we will return to a balance in trade in order to pay off our indebtedness on time. This is a result of the process of coordinating multiyear plans with the CEMA countries. I do not want to say anything more on this subject since it deserves a separate, broader discussion. It is, however, an indisputable matter that cooperation with the CEMA countries is our one possibility for modernizing our economy. The West has fenced itself off from us with an embargo wall. Not to notice this and to undervalue at the same time the significance of our ties with CEMA countries has nothing in common with objective economic analysis, but views of this kind can be found even in seemingly serious publications.

[Question] In concluding our conversation, I would like to ask for a comment on what is being said on the subject of the supposed breakdown of the economic reform.

[Answer] Instead of answering this, I will quote the words of General Jaruzelski in his speech before the Commission on Economic Reform: "Reform, as is apparent from the word, is not a static category; based on fundamental principles, it should constantly improve its forms, its specific solutions and mechanisms, and this is, after all, what has been systematically realized in the past years."

LETTERS TO AGRICULTURAL FUND COMMITTEE REVIEWED

Warsaw PRZEGLAD KATOLICKI in Polish No 6, 9 Feb 86 p 3

[Article by Slawomir Siwek: "Letters from Farmers: Waiting for the Foundation"]

[Text] I analyzed 140 letters that came to the Organizing Committee of the Agricultural Foundation in 1984 and 1985; these letters pertained to most important matters. I saw 106 personal applications for work or cooperation with the Foundation. Finally I saw 223 farm applications that were at that time on the agenda of the Committee. The applications were sorted into 10 programs that the Foundation intends to implement.

The letters that came pertain to social questions (relief, outright grants in connection with natural disasters or the age of the farmer) as well as questions of credit (questions on the conditions for credit to be granted, or application for credit), or purchase assignment of farm machinery. This type of petition appeared more often at the beginning phase of the venture. In 1982 and 1983, the majority of the letters asked for charitable assistance, many of those applying personally to the Foundation believed that the "Church is creating still another charitable committee."

Some of the letters pertained to conditions for obtaining help with credit for developing a private shop for manufacturing or for providing a service. There were also general statements and remarks of the writers about ideas and institutions of the Foundation. These are sent to the experts working on the programs, and some of them become the subject of discussion for the whole Committee. It should be stressed that there were very few letters that attacked the idea, undermined its significance, or questioned whether it makes sense in general in our economic system. These came from city people and not from the farmers.

Finally, there were quite a few letters asking for additional information about the Foundation because the writers were interested and wanted to send in specific economic applications.

The Committee also has in its folders a special group of letters. These are applications written in the name of parishioners or by the pastor of a village parish himself. From these letters, it is clear that whole villages, not just individual farmers, are expressing great needs.

There are also expressions of a desire for economic cooperation sent by directors or presidents of various enterprises or associations. These expressions are evidence that if the Foundation becomes a part of the system of a reformed economy, such cooperation is not only possible, but is necessary. These letters indicate also that many leaders of enterprises know how to work without restraint, and how to cooperate with institutions of a new kind without being afraid of the economic risk of such cooperation. This is encouraging and constitutes an interesting motivation for discussion of the possibilities of Poles working under normal relations and economic conditions.

Perhaps this is the source of the concern of Jan S., of Warsaw, who in his very serious letter, shared his thoughts on this subject; he wrote that "...we must aim at the Foundation's having a lasting character." This is true -- there is nothing worse in managing than uncertainty about tomorrow. Jerzy K. from Radom Province, in a comprehensive "Discussion of the Proposed Foundation," wrote: "We must remember that the effectiveness of Polish agriculture depends not on the producers, but on the policy under which they operate, on certain economic mechanisms and moves of the authorities."

Meanwhile, Edward W., a farmer from Rzeszow Province added, "...during the last few years (especially in the second half of the 1970's) the Polish village suffered a significant transformation, particularly in certain places. It became a territory to which for the first time in history there was a massive flow of all kinds of technical equipment: tractors, automobiles, agricultural machinery. It was turned into a construction site in which much was invested in various ways. Observations indicate that almost 2/3 of the newly built construction in the villages actually appeared in the 1970's. Unfortunately, this advantageous process was not, and here lies the principal error, accompanied by a process of concurrent creation of a broadly understood infrastructure...specifically: there were inadequate supplies, neglect of important consequences resulted in bringing technical equipment to the villages without at the same time creating in them a network of points for servicing the equipment. Analogous to this is the problem of expanding the investment front in the villages and the gradual decline of interest in the possibilities of obtaining raw materials and producing construction materials. The Polish village...is experiencing a complete lack of service points for this mass of technical equipment..."

Let us now hear directly from those who are interested. Their letters speak for themselves. This is only a small fragment of the correspondence that comes from the villages. Perhaps the time will come for sociological and economic analysis of these voices; they give us picture of life, work problems, and cogitations of half of society, a picture that is not dimmed in any way, and is directly and indirectly connected with the part of the economy that is basic to our existence.

[Excerpts from Letters to the Foundation]

I would like to express my great concern about the Agricultural Foundation and its particular interest in the farmers of Pomorze. They place great hope in the activation of new departments for producing foodstuffs and in a certain increase in the numbers and modernization of machinery and equipment. The state of Polish agriculture continues to be catastrophic with respect to supply of machinery and equipment in view of the further drastic increase in prices of machinery as of 1 July 1985, as well as the scarcity of machinery and the difficulty of procuring it, even if the farmer has the money. -- Ludwik M., Gdansk Province.

(...) The Agricultural Foundation was established by the Church in agreement with the government for the purpose of helping individual farmers, who have been undervalued for years, although they feed us and have fed us; we must speed its implementation. Let all Polish organizations abroad and others rise up to revive the national economy, but the government of the Polish Peoples Republic must go forth to meet them... -- Konstanty Z., from a letter to the marshall of the Sejm, copy to the Agricultural Foundation.

(...) opens with an order for a set of equipment and pipes for building an artesian well and water pipeline. This would be a project for the parish of the village R. in Radom Province... (...) hereby presents the requisition of the village K. for the construction of a water pipeline and restoring to service the stopped up artesian well. This project is of interest to 150 families, and the construction would be sponsored by the pastor of the local parish... -- Leokadia G., master of law, farmer.

Those now living in our village number 367. We would like to inform you that in our village, as in the neighboring villages, there are no shops of the water-sanitation branch... At present, our committee has ordered documentation for a water conduit network (each farm would have one water terminal). We already have a project director who undertook to prepare the documentation for reconstructing the water supply to the tannery to supply the village with water. We have had initial discussions with the contractor who undertook to build the water conduit network... -- Community Committee for the Construction of a Water Conduit in Ch., Zamosc Province.

I am turning to you with a request that our cooperative be assigned a grain and potato combine. Our village, numbering 60 houses and 14 outlying establishments, has no machine of that type... -- 14 signatures, Biala Podlaska Province.

A team of specialists in agriculture of the pastoral center in S. would like to inform you that the local peasant farms need the following production equipment: (list)... -- five signatures, Tarnobrzeg Province.

We (three persons) are at the stage of organizing a plant for producing insulating-structural elements for village construction. We have the necessary materials base. We need to find a cooperative consultant so that what we produce would be easy to dispose of and would be entirely up-to-date. -- Adam T., Katowice Province.

There are 18 farms of average size in our village. The village would be glad to buy machinery and a tractor. I am a driver and mechanic. I would gladly undertake to serve the farms and to repair the machinery... -- Barbara and Jaroslaw C., Bialystok Province.

I have at my disposal an unusually large site on which stores and umbrella roofs could be built with the assistance of the Foundation. On this site, we could also set up a district service point and emergency repair station for equipment received from the Foundation... -- Antoni H., Ciechanow Province.

With the help of the Foundation, my family and I could enlarge our shop and provide services to the village in the fields of general locksmithing, installation of water canals, and even tractor repair... -- Kazimierz J., Lodz Province.

We had the idea that with the help of the Foundation, we could refurbish our old school and create some kind of center for agricultural information here... Stanislawa M., Siedlece Province.

I am asking you kindly to get me some farm machinery... My request is motivated by the fact that for five years I have been asking for these machines with no effect; many are willing, but the state allotment is small in our region... -- Franciszek Z., Hrubieszow Community.

(...) I have thus far not received even one farm machine from the administration of the community; I need this machinery very much on my farm. In connection with this, I sincerely ask the Organizing Committee of the Agricultural Foundation to make it possible for me to buy farm machinery... -- Edmund P., Czestochowa Province.

[----] [Regulation of 31 July 1981, On the Control of Publication and Spectacles, Art 2, Pt 6 (Official Gazette, No 20, Item 99, revised 1983, Official Gazette, No 44, Item 204)].

BRIEFS

COMMON MARKET REPS ON POLISH FOREIGN TRADE--The subject of the discussion between Chairman of the Polish Chamber of Foreign Trade R. Karski and representatives of the chemical and petrochemical industries' associations of the ECM countries M. Cockburn and R. H. Hoskin, on the 16th of this month, were the means of functioning of the Polish exporters in foreign markets. M. Cockburn also gave a lecture devoted to the problems of ECM. [Text] [Warsaw ZYCIE WARSZAWY in Polish 17 Sep 85 p 2] 12916/7687

CEMA MEETING ON ENERGY--The 10th session of the representatives of CEMA countries with participation of scientists from Yugoslavia and Finland has begun at Cracow's Stanislaw Staszic Academy of Mining and Metallurgy. Among other things, participants of the meeting will reach agreements on the subject of common plan of research for 1986 and in the next 5 years in the area of work on unconventional energy sources. [Text] [Warsaw ZYCIE WARSZAWY in Polish 17 Sep 85 p 2] 12916/7687

CEMA COAL INDUSTRY COMMISSION--On the 23rd of this month a delegation of Polish coal industry representatives left for Bucharest. The delegation will take part in a several-day session of the Permanent CEMA Commission for the Coal Industry. The deliberations of the Permanent Coal Commission will take place in Dewa, and will be presided over by the permanent chairman of the commission, minister of mining and metallurgy in the Polish People's Republic, Czeslaw Piotrowski. Among things presented at the session will be information about the results of coordination of coal industry plans of CEMA countries for the years 1986-1990, means of increasing cooperation in scientific-technical fields as well as in the area of work safety and mining machinery industry. Poland's proposal pertaining to the joint exploitation of coal deposits in Lublin Coal Basin will also be discussed. [Text] [Warsaw RZECZPOSPOLITA in Polish 24 Sep 85 p 2] 12916/7687

INDUSTRIAL RESTRUCTURING TO SAVE ENERGY, RESOURCES

Bucharest REVISTA ECONOMICA in Romanian 4 Jan 86 pp 13, 15

[Article by Gheorghe Manea: "Decisive Actions and Measures for Developing the Country's Energy Base: the Complex Integration of Industrial Platforms--a Way To Minimize Energy and Material Consumptions"]

[Text] The economization of the resources per unit of useful effect constitutes an objective law of economic progress, with the maximally efficient utilization of natural resources representing a central problem in the management and performance of all economic activity. In practice, the economization of resources covers a variety of solutions: the improvement of processing technologies to raise outputs in turning raw materials into finished products, the use of substitutes for scarce resources, the recovery and utilization of manufacturing byproducts, the reintroduction of reusable materials into the economic circuit, the reconditioning of parts and subassemblies, etc.

Among them, the recovery and utilization of manufacturing byproducts stand out as a first-rate solution due to the large volume of resources found in the form of manufacturing byproducts and scrap and due to the possibility of further processing into finished products. Clearly, the first form of utilization of byproducts is the recycling of them in the same manufacturing process, but most of the time this is not possible, and then the processing of byproducts must be done in separate installations, which may or may not be in the branch's field of production. The recovery of manufacturing byproducts and the utilization of them in installations differing as to field of production stand out as a chief attribute of the complex integration of industrial platforms.

Devised relatively recently (after the energy crisis in the 1970's), the concept of complex integration has as a basic objective the minimization of the consumption of material resources in an industrial zone; the objective is concretized in a certain organization of the industrial platforms. The horizontal integration of the industrial platforms, of the installations that generate manufacturing byproducts and of the ones that can efficiently process them, is characteristic of this organization. The novelty of the concept lies in combining--along the line of manufacturing products--industrial installations in a different field, such as, for instance: ferrous metallurgy and chemical fertilizer, oil refining and coal chemistry, coke chemistry and petrochemistry, etc. Also known in the economic literature by the term "conglomerates," the horizontally integrated industrial units are linked functionally by transportation networks (which can attain hundreds of kilometers in length) over which the manufacturing byproducts circulate from the suppliers to the consuming units. Such supplier-consumer "tandems" can be offered by many kinds of manufacturing:

Oxygen-blast steelmaking has as a byproduct concentrated carbon oxide (64 cubic meters of oxygen are consumed to make 1 ton of steel), which the chemical industry can process for the synthesis of intermediate compounds and finished products (methyl alcohol, organic acids, carbonization processes, etc);

The nitrogen resulting as a byproduct from installations for obtaining oxygen in ferrous metallurgy can become a basic element in the obtaining of nitrogenous fertilizer;

In addition to coke for ferrous metallurgy, combustible gas (rich in hydrogen) and tar are obtained from coal-coking installations; 2.34 million cubic meters of gas, including 1.3 billion cubic meters of hydrogen, are obtained for an output of 5 million tons of coke. After separation, the hydrogen can be directed to the chemical industry for the synthesis of ammonia and methanol, to coal chemistry for the synthesis of synthetic fuel, to oil refining as an agent for desulfurization and hydrofining of petroleum fuel, to the machine-building industry for cutting and welding operations, to the power industry for the generation of electric and thermal power, etc.;

The hydrogen, with a 62 percent concentration, that is obtained from the synthesis of acetylene from methane gas can be used to reduce iron ore in the modern procedures for obtaining spongy iron;

High-purity carbon dioxide, a byproduct in the making of ammonia or a result of fermentation processes in the food industry, can be used as a refrigerant, dry ice, in foundries in the metallurgical industry, in the chemical industry, for the obtaining of sodium carbonate, for injection into oil deposits to reactivate crude oil, as a medium for carrying pulverized coal in coal ducts, or in the food industry (carbonated beverages etc.);

Oil refineries generate as byproducts combustible gases that contain valuable components (ethane, propane, etc.); these components are also found in associated gases. The utilization of them, alone or together, can bring petrochemical raw materials into the economic circuit, with oil importation being reduced on this basis;

From the ferrous metallurgical units, from the CET's [thermoelectric power stations] that operate on the basis of coal, from the pyrite-burning installations (in sulfuric acid plants), from nonferrous metallurgy, etc. come large amounts of ash and slag that, suitably processed, enrich the list of useful products.

However, not only high-tonnage byproducts but also many other byproducts, in varying amounts, that accompany production activity are specific to the effecting processes. The inventorying of them, the physicochemical characterization, the collection and the utilization of them are activities more difficult to organize and perform than the reintroduction of high-tonnage byproducts into the economic circuit; however, they can stimulate the local development of small and medium-sized installations.

The horizontal integration of the economic units--according to the above-mentioned concept--begins with the utilization of high-tonnage manufacturing byproducts, which justifies the achievement and operation of industrial installations with optimum processing capacities from an economic viewpoint. As a world practice common to the industrially developed countries, in the horizontal integration of industrial platforms several trends and forms of organization have appeared, of which the following stand out: the collection of combustible gas byproducts (hydrogen, carbon monoxide, methane, C_2+ components, etc.) from the installations where they appear and the sending of them to potential consumers, which extract from the gas mixture the component needed by them and return the rest of the components to the network; the achievement of networks for direct transportation between installations complementary as to field, such as ferrous metallurgy and nitrogenous fertilizer, coke chemistry and petrochemistry, etc.; the achievement of networks specializing in primary elements (raw hydrogen, for example), which take the residual hydrogen from sodium-chloride-electrolysis installations, refineries, coking plants, etc. and direct it to the coal-chemical installations, ferrous metallurgy, machine building, etc. The same type of network can be conceived for carbon dioxide, which can cover a wide range of uses in the territory's economy. For low-tonnage byproducts a variety of means are being tried in order to return them to the economic circuit, means difficult to handle because they involve small producers, in particular, which are numerous and scattered over a vast territorial area and, in general, lack research and development sectors of their own that would devise technologies for processing the byproducts in the area.

The practices which have asserted themselves and which could be of interest for application in our country too are the following:

a) The founding of a research institute for the utilization of manufacturing byproducts, organized with territorial branches. Information about all inventoried byproducts in the economy, characteristics, and quantitative evaluations are kept in the institute's data bank. The institute's main tasks consist of establishing the conditions for storage and packaging, transportation, and utilization of byproducts, approving the technologies and equipment for utilization, and disseminating--for generalization--the research performed. For byproducts that do not yet have conditions for utilization, the institute indicates solutions for storage or neutralization; the last variant is recommended in the case in which they cause pollution;

b) Another form of organization, characterized by the facilitation of contacts between suppliers of and (potential) consumers for manufacturing byproducts consists of the so-called "scrap exchange," or a central organization (at the level of the national economy) with branches in the main industrial zones. This organization collects data and information on all manufacturing byproducts and scrap (including reusable materials coming from the network of the population's consumption), on the known technologies for utilization, and on the place where they are practiced. The selling and purchase prices of the manufacturing byproducts are set directly by the parties involved; the organization that facilitates the contact between the partners gets a commission from the volume of sales.

The vertical integration of industrial platforms is meant to ensure the normal operation of the economic units, independent of the economic and political situation on the market supplying raw materials. This trait specific to the complex integration of industrial platforms is concretized in: the promotion of alternative sources of raw materials, the securing of big reserve stocks (with corresponding technical and financial implications), and the providing of at least one source of supply of their own that would offer stability over time to the operation of the economic system.

Vertical integration is a component of the strategies for developing groups of products or industrial platforms; the harmonization of territorial development by "assembling" the strategies proper to each production unit must be done in accordance with the objective of the complex integration of industrial platforms. The utilization of the concept of the complex integration of industrial platforms as an instrument for the minimization of material consumption on a territorial basis entails:

1) The inventorying of the manufacturing byproducts coming from the industrial platforms that are situated on a relatively limited area (about 7,500 square km) and from all economic units on this area;

2) The possibility of the utilization of byproducts with the following being taken into account: the concentration of useful components, the technologies suited to utilization, and the efforts needed by the research and development sector for devising or assimilating the technologies needed for utilization and the corresponding implements and equipment; the economic units existing on the territory that can use manufacturing byproducts as raw materials; and the plans for economic development on a territorial basis;

3) The state's involvement for the financing of the construction of the main networks for transportation of manufacturing byproducts to consumers as well as the granting of loans for the operations of storage of byproducts until the solutions for utilization are found;

4) The founding of a central institute (with zonal branches) with a view to securing the utilization of low-tonnage byproducts;

5) The orientation of the programs for investments and for renewal of the fixed assets of the existing production units in order to delineate the integrated industrial platforms.

The possibilities offered for the development of the local economy and industry by byproducts from large-scale industry are immense. Among them are: the fertilization of soil by means of residual water containing ammonia coming from ammonia-synthesis installations; the taking and further processing of "offgrade" products from large-scale industry (finished products with characteristics below the quality standards) by local industry; the obtaining of construction materials (including of a composite type) from manufacturing scrap and byproducts; the utilization of residual carbon dioxide from large-scale industry or from fermentation processes in the food industry for the intensification of agricultural production in hothouses, the manufacture of carbonated beverages, the intensive cultivation of biomass, etc.; the founding of units for the reclamation of lubricants, the reconditioning of spare parts, the gasification of manufacturing byproducts (polymer scrap, wood scrap, etc.); and so on.

For Romania, a country where industry has been developed, in particular, in units of large dimensions, "the filling-in of the area of influence" of the industrial platforms with units of small-scale industry has become an urgent necessity, bearing in mind that they can efficiently and rapidly utilize manufacturing byproducts without requiring massive displacements of human groups or the making of large expenditures for achieving the infrastructure corresponding to the urban settlements adjacent to industrial platforms of large dimensions. Small-scale industry entails minimal energy consumptions, possible to provide from secondary energy resources from large-scale industry, and low capital investments for the means of production. The implementation of the first units of small-scale industry (in the 1986-1990 5-year period) under the auspices of the big enterprises could represent a solution for initiating a massive program for developing the small production units throughout the national economy, thus creating the system of the effects characteristic of industrial platforms with complex integration.

ECONOMY ROMANIA

INCREASED RESPONSIBILITY IN MANAGING ENTERPRISE PROPERTY URGED

Bucharest REVISTA ECONOMICA in Romania 4 Jan 86 p 17

[Article by Stefan Craciun: "The Growth of Responsibility in Administering the Enterprise's Holdings"]

[Text] The qualitative elements of the administration and development of socialist property acquires a special importance in the process of intensive development.

In this context, we want to dwell on the necessity of firmly following all instructions and provisions with regard to receiving assets and taking them under administration. To this end, in all enterprises it is imperative to understand the objective necessity of strengthening the direct collaboration of the technical personnel with the economic and financial personnel. It must be understood fully that the fulfillment of obligations such as the active participation of all members of the commissions with powers in the field in the reception of assets and the actual, direct performance of it, the timely detection of any differences between the data in the documents and the facts, the recording of assets for accounting and administration, and others are tasks not only of the financial and accounting personnel but also, equally, of the technical personnel, who can and must contribute responsibly to the performance of such activities.

In all enterprises it is necessary to act more consistently so that the materials supplied as well as the products made may have the proper storage spaces provided, which would prevent the damaging, destruction, loss or waste of them; so that the measurement, weighing, and control apparatus may be kept in perfect operating condition and may be used properly, where the production process requires it; so that personnel with suitable training may be provided at the places for reception, preservation, and release of all assets; so that in the production sections perfect order may be provided in positioning the raw materials and introducing them into manufacture; and so on. All these aspects are not minor at all if, for example, we specify that, last year, the control bodies of the Ministry of Finance identified in some enterprises millions of lei in losses of public property because the storage and preservation of the assets were done improperly and, as a result, they were damaged and deteriorated.

The fact is known that any movement of material and monetary resources is achieved on the basis of documents that contain data referring to their quantity and quality. In this field, for some operations that reflect the growth or decline of the holdings of the socialist units for which forms such as receipts, checks, shipping notices, invoices, waybills, or purchase statements are used, a special system of reception, recordkeeping, release, and control is stipulated in the provisions in force. The utilization of these documents through the instituted channel is meant to secure at the same time both the supervision of the circulation of each copy of these forms and, in particular, the accuracy of the data in the documents in question and the agreement between these data and the material and monetary resources actually in movement. In a close connection with this, the activity of guarding the assets is also regulated, an activity within which a special accent is put on organizing the guard posts and instructing the personnel entrusted with performing the guard and on exercising strict control regarding the entry and exit of all material and monetary assets to and from the socialist units. Practice has demonstrated that even in these so clear and precise matters there are shortcomings and deviations, which, at first sight, can seem minor and routine but which have in numerous cases detrimental consequences for the holdings of the socialist units, because not everywhere are the circulation and the accuracy of the date on the special-system forms noted and checked rigorously, is the gate inspection performed with maximum efficiency, and are all means of transportation that enter and leave the socialist units recorded.

The periodic inventorying of the component elements of the holdings of the socialist unit constitutes one of the main methods of preventing the cases of poor administration, waste, and theft of public property. However, it must not be understood as a task of just the financial and accounting apparatus, there being prevented the formal, bureaucratic performance of it without actual verification of each item on the spot. The inventorying must be performed thoroughly in joint actions of the economic personnel and the technical personnel, who together, on the commissions appointed in accordance with the law, should record both quantitatively and qualitatively the elements of the holdings, for the major purpose of having reliable data available that would give the management personnel the chance to make decisions regarding the continuity of the production process and the growth of its efficiency, to set the policy for creating and utilizing the stocks in accordance with the economic and financial possibilities at any given moment, and, if the situation requires it, to hold responsible those to blame for causing losses.

With a view to the proper administration of the holdings, a particular importance also goes to strengthening the responsibility of each working person. It must be manifested in two main directions: for strengthening, first, the responsibility with a general character, applicable to any person engaged in work, regardless of the position held, and, second, the clearly indicated responsibilities according to the positions held, of management or execution. In both cases, however, the essence of the strengthening of the responsibilities is that, on the basis of thoroughly studying the meaning of the state's laws, each working person must act firmly in a dual sense: on the one hand, to not himself commit infractions or violations of the laws and, on the other hand, to fulfill his official duties in such as way as to be relentless in holding responsible those who are guilty of acts contrary to the provisions in force. In this framework, the matter of establishing the obligations as clearly as possible and having them understood in advance by each working person, through the recording of them in the job description or in other documents, is also essential, in our opinion.

CROATIAN FOREIGN TRADE DEFICIT IN 1985

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 31 Jan 86 p 2

[Excerpts] Last year Croatia exported $2.491 billion worth of goods, accounting for 23.8 percent of total Yugoslav exports (and 25.4 percent of the Yugoslav social product) and imported $2.805 billion worth of goods.

Last year this republic collected $788 million from all exporters to import 902,000 tons of coking coal, 2.887 million tons of oil, and 401,000 tons of oil derivatives. This is 28 percent of the value of Croatia's total imports. In regard to coverage of imports by exports, Croatia remains, as in 1984, in sixth place among other republics and provinces with only $88.8 of exports covering $100 of imports, or 9 percent more than the Yugoslav average. The final result is a $314 million trade deficit.

In earlier years Croatia, like others who have oil refineries, had a more favorable export/import relation in the convertible currency area than in the clearing-account area. Now the situation is entirely different. In regard to coverage of imports with exports in the clearing area, Croatia surpasses Serbia and is in third place after Kosovo and Montenegro. [Exports from] shipbuilding and delivery of ships to the USSR have contributed to this.

Exports to the convertible market amounted last year to $1.248 billion, or only 1 percent more than one-half of total Croatian exports. Imports amounted to $1.939 billion, or 69.1 percent of all imports to this republic and 24.3 percent of Yugoslav imports, so the deficit was $691 million, or 41.6 percent of the total deficit of the five republics and two provinces with deficits (Slovenia had the only favorable trade balance last year). Coverage of imports by exports amounted to 70.6 percent, compared to the country average of 80.3 percent.

The deficit on the convertible market was more than halved by the positive balance on the clearing-account market where Croatia exported $1.243 billion worth of goods, a little more than three-tenths of Yugoslav exports to this area and 1 percent less than one-half of Croatia's total exports last year. It imported $866 million worth of goods, resulting in a favorable balance of $377 million.

IMPLICATIONS OF FOREIGN TRADE REGIONAL STRUCTURE

Zagreb DANAS in Serbo-Croatian 5 Nov 85 pp 25, 26

[Article by Ivo Jakovljevic: "A Narrow Door to the West"]

[Text] Are the so-called Eastern markets becoming more attractive for Yugoslav export even as our own market is perhaps becoming more attractive (even temporarily) for that economy?

Time is a witness (and in such matters one unlike any other) that Yugoslavia, whenever it has entered a crisis has done so through excessive import from the West and obligations to it, and that whenever later Yugoslavia tried to emerge from the crisis it tightened Western imports and increased the sale of its own goods on the Eastern markets, and that finally whenever Yugoslavia planned to radically increase its position in the world economy, then it strived to do so by increased export to the West. All three aforementioned phases of the same developmental process so far have several times repeated themselves almost cyclically, which today leaves open the question once more: Is the movement in recent months of Yugoslav goods to the East excessive, temporary, or perhaps lasting, or is there in sight for us some kind of new penetration through the ever-narrower door of competition to the markets of the most developed Western countries; will there follow a period of Yugoslav technological and developmental regeneration; will this same tale repeat itself on a higher, equal or perhaps lower socioeconomic level than the existing one?

Instead of some pseudo-philosophical palm-reading for the answer to the question of what awaits us (does anyone still think it can be known?), we shall attempt to answer the question using the latest data on foreign trade of Yugoslavia, which we have come upon recently. Consequently, the Yugoslav economy from early January until the end of October increased its total exports by some 8 percent, while simultaneously imports increased only 3 percent. If one adds to this the expectation that the social product will grow by only 1 percent this year, it is clear that the export results, however distant from those planned, are still one of the brightest spots of Yugoslav developmental and economic policy.

However, on the reverse side of these data on export success is the completely different side of the coin, which calls almost all of this into question, or at least introduces a new question of a strategic nature. That is: Can

Yugoslavia extricate itself from the crisis if it keeps exporting more to the East, and less to the West, along with an absolute decrease in trade with developing nations? Or, how will the economy get out of this crisis, in whose structure of export raw materials, semi-manufactured goods and unfinished products once more prevail? And how can dollars, or equivalent dinars, be earned by such exports, when our competitiveness, especially in Western markets, is getting ever weaker, when in an era of new scientific-technological revolution, we offer the world mostly goods with which we could possibly have prospered only in the already distant sixties?

Exception and Rule

Be that as it may, even Yugoslavia does not find it easy to create the image of a white sheep among heavily indebted nations, when on the world market in the last 2 years the increase of mutual trade has been achieved above all by the most developed industrial countries, while the heavily indebted, especially Mexico and Brazil, record the largest export failures. Is it possible in general in that context, in the middle of the common mire of debt, for Yugoslavia to be the exception to the general rule?

Our advantage, the only one which possibly still exists, is precisely in the ever-cheaper share of our labor cost in exports, especially on the most discriminating, convertible market. One witness to the aforementioned thesis is our export of the Zastava "Yugo-America," which came about due to the exceptionally low cost of labor in the Yugoslav economy (compared with international competition in that and similar areas of exchange). It could be said that just now, when in many ways we are scraping the bottom in regard to standards, quality and efficiency by European dimensions, our chances for export are growing, under the assumption that as soon as possible we will be openly included in the world technological revolution.

For such an undertaking, indeed, what is needed above all is that correct maneuver: the introduction of market selection in the domestic market, without which, considering the cumulative expenses of production and of the superstructure, which are now the question, it is almost inconceivable to step through that narrow and ever-narrowing door of trade with the West, whose banks we currently owe about $18 billion in principal and approximately the same amount in interest, fees and profit margins. In short, from this perspective one can freely conclude that the basic problem of the Yugoslav economy today is how, in the shortest period, if possible sometime before 1990, can export be doubled, and in that scope above all on the convertible market, so that the whole bag of our foreign debts would become somewhat bearable for the Yugoslav working class and for the price itself of our goods on the international market.

It seems plausible in today's structure under the burden of debt and impossibility of catching up with the world's most technically developed nations that we must sell ever more goods to East European socialist countries, which still significantly lag behind Western competitors in their productivity and technology and in the quality of supply and demand. So they are, apparently and at least temporarily, our most open trade outlet, just as we, within our own parameters and with a declining share in the world economy, are the same for them today and will probably be so for a few years more.

Technological Lag

The latest estimate, of written-off and obsolete domestic technology, has shown that Yugoslavia, because of limiting imports after 1979 as a result of indebtedness, has swallowed a large, bitter pill. The level of equipment write-off in the most dynamic and export-oriented branches of our economy is somewhere from 68 to 80 percent, and with such a balance it is indeed difficult to expect greater export penetration into the most technologically complex world markets. Found in these figures is also one of the reasons why the policy of a more realistic exchange rate of the dinar, which has been intensively carried on for 3 or 4 years already, can no longer provide that which was (exaggeratedly) expected of it: i.e., that this policy alone would solve all questions of the stimulation of export and restructuring of Yugoslav production. Thus, even though the rate of the dinar slid by almost 55 percent from the beginning of the year until the end of October, all the same our competitiveness in Western markets has not increased, although it still holds fairly well in the East. Isn't it then completely logical that a considerable portion of goods simply move to the Eastern markets, so that the coverage of import by export in the first 10 months of the year was almost in total equilibrium, while on the Western side it fell to only 68 percent!

In the mid-sixties, in its economic strategy, Yugoslavia advanced the rule by which our foreign trade was required to tend toward a regional exchange structure, that is, two-fifths of world trade to be carried out with Western countries, two-fifths with Eastern countries and one-fifth with developing countries. However, our latest data show that in export, one-half our goods also this year went to the East, one-third to the West, and only one-fifth to developing countries. At the same time, on the import side, less than one-third of imported goods came to us from the East European socialist countries, somewhat less than half from the West and one-quarter from developing countries. When all this is added together, the planned formula is being realized, but its final balance is expressed in our debts, which would be difficult to repay without rescheduling or taking new credit.

What could be most worrisome to Yugoslav economic planners is the fact that in the last 5 years, and especially last year and this year, the export items which increased most in Yugoslav exports were from those branches which are primarily labor-intensive (a cheap labor force?), for example: production of leather and shoes, chemical products, electric machines and appliances, shipbuilding, ferrous metallurgy and furniture. These branches at the same time made the greatest contribution to the somewhat increased movement of our exports to the East.

At the same time severe import limitations affected most the export of those products which until then had been traded primarily with the West, so to a certain degree it is more understandable why our quantitative export to developed Western nations today is barely greater than it was in 1980! It is difficult to blame either economic policy or only the exchange rate of the dinar and other segments of that policy for all this. Obviously, in its totality, our economy, with its present expenses, organization and lagging technology, cannot, just like that, pass through the narrow door of trade with the West.

Like some sort of third side to the coin of trade in question, in recent months discussions on the new 5-year plan of development to 1990 have taken place in committees of the Assembly of the SFRY, in which (in the discussion of general illiquidity) the additional question was opened up of channeling the remaining capital accumulation to individual developmental programs. So there is a further dilemma: should more domestic capital go toward developing production of raw materials, energy and food, or should the majority remain with banking organizations, which would allocate it, above all, to increase export-oriented production. Metaphysically, the following question arises: can this export-oriented production in general increase without a solid base of raw materials, energy, and even food, [the importance of which is seen] only in the slogan "[important] as our oil."

The Cost and Direction of Togetherness

Therefore, great expectation surrounded the papers of the Chamber of the Economy of Yugoslavia, whose task was to prepare "in harmony with the new law on social planning" a third, highly controversial section of the 5-year plan of the nation's development, the so-called joint directions of development of the country, development of which would allegedly possibly tie up almost 70 percent of the planned capital accumulation. Thus, the Chamber of the Economy of Yugoslavia has envisioned 16 joint directions of development, among which are energy, railroads, post-telephone-telegraph, highways and programs of an export nature, such as the "Yugo" automobile, metal processing, ferrous and nonferrous metallurgy, forestry and the lumber industry, textiles and clothing, leather and footwear, tires, sea and river traffic and tourism. On this basis, the Economic Council introduced its estimate, according to which export by the end of 1990 could total exactly 26 billion dollars, therefore almost double what it is this year. Such an estimate meshes almost to the dollar with another, previous calculation, according to which the Yugoslav economy, for normal economic activity in the last year of this decade will require at least $26 billion for normal needs and regular repayment of foreign debts which come due. Somewhere behind these figures there is supposed to be the estimate that from 1986 to 1990 Yugoslavia could be in debt an additional $15 billion!

In any case, the criteria of the world market and cost economics as such still remain to be introduced above all into the domestic market in order for any part of the Yugoslav economy to have some place in the world market, especially in its most developed Western part. All this should be fostered by the latest changes in the economic system (in banking, foreign currency, accounting, etc.) as well as in a new series of measures of the economic policy aimed at reducing inflation and strengthening a united Yugoslav market. The only thing which remains uncertain is who must pay what price within Yugoslav society for this sort of restructuring of the economy and radical turning-around in the style of economic operation on the threshold of the second half of the eighties.

How We Fared in World Trade

	1981	1984
Export (total) billions of dollars	10,928	10,254
Import (total)	15,757	11,995

Regional Structure of SFRY Export

	1981	1984
Developed nations (percent)	32	36.5
Socialist nations	49.6	47
Developing nations	18.3	16.4

BRIEFS

REPUBLIC BUDGET REVENUES--Last year sociopolitical communities [republics, provinces, opstinas] had budget revenues totaling 1,260.1 billion dinars, nearly 60 percent of which was collected from sales taxes, taxes on services, revenue from property, etc..., 22.7 percent from customs duties and special fees, 14.6 percent from income taxes and personal earnings taxes, while 3 percent was other revenues. The largest increase in revenue was from taxes on [enterprise] income and personal earnings, namely a 121-percent increase countrywide (97 percent increase in Bosnia-Hercegovina, 202 percent in Montenegro, 122 percent in Croatia, 121 percent in Macedonia, 178 percent in Slovenia, and 108 percent in Serbia); taxes on incomes of OURs (organizations of associated labor) increased 351 percent in Montenegro, 488 percent in Macedonia, 561 percent in Slovenia, and 393 percent in Vojvodina. [Excerpt] [Belgrade EKONOMSKA POLITIKA in Serbo-Croatian 3 Feb 86 p 13] /12947

BANKING LAW CHANGE--Business people and bankers have pointed out that the new Law on the Foundations of the Banking and Credit System adopted at the end of last year has come to a standstill over its most controversial provision, Article No 193, which stipulates that beginning on 1 January [1986] business banks cannot grant credits to work organizations which are operating unprofitably, if they do not own at least one-sixth of their own working capital, or if they operate exclusively on borrowed money. This would be fine, except that application of this provision would mean putting out of operation about 85 percent of the work organizations in certain parts of the country (with all the economic, social, and political consequences arising from this). However, as the law was adopted in an "emergency procedure," it seems that this provision went unnoticed by those who proposed and adopted the law. One should not be surprised at the report from a recent meeting of the Federal Executive Council (FEC) that this provision of the new law is already being supplemented by a transitional provision permitting short-term credits for current operation. [Excerpt] [Belgrade PRIVREDNI PREGLED in Serbo-Croatian 22-24 Feb 86 p 12] /12947

The FEC has submitted to the SFRY Assembly a proposal suspending paragraph 2 of Article 193 of the new Banking...Law until January 1987, thus permitting the taking of short-term credits for enterprises for this year. [Excerpt] [Belgrade PRIVREDNI PREGLED 26 Feb 86 p 2] /12947

KRSKO FINANCIAL BURDEN--Because of unpaid obligations on credits for the Krsko nuclear power plant and part of the Trbovlje thermal electric power plant, the Bank of Ljubljana on 19 February blocked all funds of OURs (basic organizations of associated labor) which make up the Electric Power Industry of Slovenia. It is a question of rescheduled interest payments in the last 2 years which have to be paid by the end of March, as well as part of the principal. So all OURs within the electric power industry of Slovenia are feeling the effects of this investment. Mihael Cerpes, member of the business council of the Electric Power Industry of Slovenia, said: "Our total debt for maturing interst and part of the principal, above all, for Krsko...was 5.242 billion dinars on 21 February 1986. We assume it is now less since the bank blocked the accounts. We expect to settle our obligations by the end of June this eyar, but the bank's action has disrupted our operations considerably." [Excerpt] [Belgrade PRIVREDNI PREGLED in Serbo-Croatian 28 Feb 86 p 1] /12947

AGRICULTURAL EXPORTS DECLINE--According to latest estimates, agricultural and food exports last year amounted to about $800 million, or $200 million less than in 1984. This year exports valued at $1.17 billion are planned but this is...considered more a desired figure than a realistic one. Only about $200 million was earned in 1985 from exports of fruits and vegetables, or $100 million less than in 1982; in fact, only 3 percent of total fruit and vegetable production was exported. The domestic market absorbed 65 percent of production, but 32 percent is unaccounted for, as a result of poor market organization. In regard to animal, meat, and processed meat exports, an ambitious export plan of $480 million has been established, which would be about 20 percent more than that achieved in 1985. But marketing on foreign markets is difficult, and the basic problem is the high cost of production, such that if the export plan were achieved it would mean losses of 510 million dinars for exporters unless [cost] conditions change. Although the world prices for corn are too low to stimulate our exporters, it is nevertheless expected that over 1 million tons of corn from the 1985 harvest will be exported because of the large decline in livestock production; all of this would be in barter trade. MEDICAL ASSISTANCE IN PSYCHOLOGICAL TRAINING RELATED

East Berlin ZEITSCHRIFT FUER MILITAERMEDIZIN in German Vol 26 No 6, Nov 85 pp 244-247

[Article by Col Dr K. Hollenbach et al: "The Work-Related Medical Care of Members of the Army as a Contribution by the Medical Service to a Further Increase in the Fighting Strength and Combat Readiness of the People's Army"; first two paragraphs are summary]

[Text] Medical care in the military, as the sum of measures oriented towards the individual designed to prevent or significantly reduce service-related limitations to performance and disruptions of health, is an important component of the steps taken by the medical service to increase the fighting strength and combat readiness of sections and units of the People's Army [NVA].

Presented and discussed is a model of care that builds on itself and takes into consideration job characteristics and individual capabilities. This system includes general preventive measures for all members of the army, special preventive examinations for certain military activities as well as differentiated dispensary care for selected members of the army.

The fostering, maintenance and restoration of health as well as the guarantee of a high physical and psychological capacity among members of the NVA are important preconditions for an increase in the fighting strength and combat readiness of sections and units and a primary goal of the health service in the NVA.

The medical service as a special organizational form of GDR public health in the NVA is putting into practice in the armed forces the health policy of the SED under specific military circumstances. The minister for national defense, Gen Heinz Hoffmann, characterizes its duties as follows: "The medical service has in all armies and at all times played a large role in consolidating and strengthening the fighting power of the troops. In socialist armies, and thus in our People's Army as well, the medical service is accorded particular significance, since we have as our starting point the high humanistic ideals of Marxism-Leninism, where man, care for man and the maintenance of his physical and mental strength are the focus of societal attention. This significance and the role of the medical service have risen sharply under the conditions of modern warfare which--if it cannot be averted by peace-loving people and states--will be warfare using means of mass destruction...We are largely dependent on the work of our doctors, medical orderlies and first-aid attendants for creating a high and continuous level of readiness for action among our units and sections" (1).

The achievements in the medical safeguarding of the army and navy forces during the nearly 30-year existence of the NVA, including military-related medical care, would be inconceivable "...without the help and support of our friends, the Soviet military doctors, without the benefit of the experience of Soviet military science and military medicine" (10).

On the occasion of the 40th anniversary of the victory of the Soviet army over Hitler's fascism and of the liberation of the German people, it should be remembered that it was Soviet military doctors and hygienists such as Major General Dr Kurpita, Maj Gen Dr Agafonov, Maj Gen Dr Belyakov, Colonel Prof Dr Kudrin, Col Prof Dr Medvedev, Col Prof Dr Koselev who unselfishly imparted their experiences and knowledge in the organization and implementation of an effective military hygienic supervision and security system as well as military-related medical care of members of the NVA, thus contributing to a new, objective understanding of service-related medicine in the armed forces in the interrelation of members of the army with military activity and the military environment. As a demonstration of these correlations, reference should be made to the examination model already published (2, 5), derived from Caregorodcev and Erochin, from which the central position of military activity can be seen (Diagram 1). Since--as a result of scientific and technological progress in the military--the increasingly short periods of time in the introduction of qualitatively and quantitatively new arms systems and the consequent changes in the form and content of military activity imply a change in demand reactions, the spectrum of responsibilities of the medical service extends not least of all to the area of military-related medicine.

In view of the fact that Medvedev's "adaptation theory" (9) and Kudrin's "three-parameter theory (8) have in common the dynamic, differentiated, multifactor and multilevel way of looking at the correlation of members of the army to the military environment, military-related medical care should as follows be understood as the sum of medical measures oriented towards the individual, which for members of the army contribute to the prevention or significant reduction of service-related limitations to performance and disturbances of health. Within the context of this description, in order to avoid repetition, questions of military-related hygienic standardization as well as an assessment of military medical fitness and suitability for service will not be dealt with, referring to previous publications (2, 3, 4, 6), although these factors cannot be objectively separated from the relational structure.

The extent and content of job-related medical care for members of the army are laid down in the relevant military regulations based on existing legal provisions in view of military specifications. These exceptional features include:

1. Demands that are scarcely comparable with the civilian work process, which for members of the army exist in training and to a full extent in combat conditions, particularly in the processes of absorbing and processing information, in the necessary level of expression of psychological basic functions and psychological capabilties, amidst predominantly changeable and overwhelmingly complex influences from physical, chemical, biological and social factors. In addition, the psychovegetatively relevant stimulative structures of the military environment can at best be only an approximate equivalent of a combat situation. A comparison with professions, jobs and activities in industry is scarcely appropriate; only accidents and catastrophic situations show similarities to these special features.

2. The fast pace and strong dynamics of combat activity presuppose the possibility of a rapid and most rapid functional reordering of physically arduous activity to finely coordinated movements.

3. The specific age and sex structure of members of the army with regard to a limited period of exposition and pressure for the vast majority of members of the army demands in a garrison situation application-oriented work-related medical care, graduated with respect to form and content.

4. While the technical structure of the work place for the efficient employment of workers should be arranged such that it promotes conditions for performance while precluding both excessive and insufficient demands, this cannot be universally put into practice for members of the army in view of primacy of the combat value of military technology.

5. The highest capabilities of members of the army are mobilized in connection with concrete battle orders in combat or training situations, primarily through a desire to perform. Even in a garrison situation, this calls for the introduction of high and highest physical and psychological pressures and volitive control over them.

6. The increasingly large responsibility of the individual for the fulfillment of the collective battle orders and the continual readiness to act--characteristic of many situations--when the necessity to act is not individually discernible, for a period of time not defined for the individual, are another characteristic specific to the military.

This outline could be added to; there is no claim here to completeness.

However, it can already be deduced that military-related medical care is important in garrison situations in particular in continually maintaining and increasing fighting strength and combat readiness (Diagram 2).

Consequently, military-related medical care involves not only diagnostic, therapeutic, metaphylactic and rehabilitative measures, but also preventive measures oriented towards maintaining and raising physical and psychological abilities.

This includes general preventive measures for all members of the army, special preventive examinations for selected military activities, differentiated dispensary care for members of the army whose service duties place particularly high demands on physical and psychological abilities or whose activities burden or endanger certain organs or organ systems to a particularly high degree.

From the point of view of military-related medicine, general preventive measures include:

1. Medical supervision over newly drafted conscripts during training, in order to identify at an early stage, in cooperation with armed forces superiors and trainers, new conscripts with a low level of ability and who in other ways stand out in terms of health, and to gradually take them up to a higher level of ability through appropriate measures.

2. Cooperation in the shaping of training programs and in the preparation of training measures, especially supervision over long-term preparations of particularly performance-intensive training sections and elements.

3. The medical safeguarding of training, in view of extreme weather conditions or of methods of training that are particularly stressful in psychological and physical terms, and acquainting trainers with possible preventive measures to guard against health dangers.

4. Differentiated limitation of the extent and the length of partial fitness for duty in careful or timely decisions on unfitness for duty through insufficient physical or psychological capabilities due to illness.

5. The use of effective forms of health education and its realization as a measure specific to the target group, for the promotion a healthy way of life, and in particular for the shaping of responsible health behavior oriented towards the implicit fulfillment of military class duties.

All these measures correspond to concrete specifications in military regulations. They are being implemented in order to give support to the adaptation process by members of the army to military activity and to avoid limitations in health and performance by military activity or to make them relative in expression and prognosis. Their implementation requires active transposition by the military doctor under the specific circumstances of his unit.

Special preventive examinations are, organized as mass screenings, carried out at the beginning, by necessity during, and at the end of the service period in certain jobs. In importance, they correspond to work-related medical fitness exams and serve to establish medical suitability for military activities with known risks of exposure.

Members of the NVA are included in the examinations who are subject to exposure and are involved in activities for which medical fitness must be demonstrated according to legal provisions and military regulations.

As a result of these special preventive examinations, only members of the army for whom medical fitness has been demonstrated before assuming duties are put into service for purposes and military activities thus defined.

The content and extent of the examinations is determined according to the relevant legal provisions.

This arrangement means that part of the required laboratory-diagnostic examinations cannot be carried out in the unit's medical facility since the equipment of the type of lab found in units does not fully permit these examinations.

Military-related medical dispensaries are complex measures in health care and are carred out when particular physical and psychological strains or dangers make continual guidance, counselling or treatment necessary. Dispensary groups are organized for members of the army in special sections or jobs as job-based dispensaries for:

--senior cadre,

--airborne personnel and paratroopers,

--vehicle operators and

--divers.

These are justified by a complex effect from strains and exposures, often taking place under extreme circumstances, in special military activities that are to be carried out, or in exposure dispensaries for activities under the effect of harmful elements, such as noise dispensaries.

The job-based dispensaries are implemented in special facilities of the air force/air defense and the national navy because of the complex character of demands in NVA hospitals. The content and extent of examinations are determined according to circumstances specific to the branch of the armed forces or the predictable focal points of the exam. Exposure dispensaries are realized in accordance with stipulations concerning content and extent in legal provisions and because of demands for special laboratory-diagnostic parameters or special consultation with medical specialists, they can only to a certain degree be fully implemented in the sections and units.

Through these preventive-oriented military-related medical care measures, every member of the army is included in the system of health supervision by the medical service, in accordance with his job or activity.

When one takes into consideration that the majority of these examinations must be carried out in the medical facilities of the unit, one then sees clearly on the one hand the status of medicine in work-related basic care and on the other hand the central position of the unit doctor as specialist for general medicine. At the same time, this organizational structure sees to it that the unit doctor's area of responsibility for measures of preventive medical care is fully assured and that specialized medical care is guaranteed in accordance with the character and care circumstances of the hospitals of the NVA (7).

With the goal of a further increase in the quality and effectiveness of work-related medical care, an assessment of possible directions for development is as follows:

1. Expansion of the current examination programs,

2. Introduction of standardized, valid and reliable examination procedures that can in practice be implemented among troops,

3. Rise in the efficiency of presently operating organizational forms,

4. Elaboration of a military regulation that takes into account the overall process of preventive medical care.

These requirements can only be met through the further scientific investigation of the dialectic correlation between members of the army, military activity and the military environment.

Through the further perfection of:

-- Knowledge about military, medical and professional characteristics of jobs and activities,

-- Methods of recording and evaluating criteria in determining the state of health, fitness for duty and ability for duty,

-- Specifications of preventive measures for situations of extreme strain and,

-- Guidelines for the deployment of those limited in their medical suitability and fitness for duty,

work-related medical care of members of the army can be structured even more efficiently within the framework of general preventive measures. In the implementation of special preventive examinations, an intensification of work-related medical can be achieved through the:

-- Determination of the degree of actual individual strain on one's health by exposure to appropriate jobs and activities by way of work-related hygienic analyses and their catagorical compilation,

-- Elaboration and introduction of noxe-specific rapid tests.

-- Further technical completion of selected basic care medical facilities involved with military-related medical care in order to realize the planned extent of laboratory diagnostic examinations.

The quality and effectiveness of military-related medical dispensaries as the most comprehensive form of specifically work-related medical care can be further increased by a number of measures. In terms of methodology, there has already been a report on further developments within the framework of annual examinations of professional soldiers (10). Besides the organizational measures mentioned there for increasing patient-effective time, a further contribution can be made by the drawing up of:

-- A catalogue of jobs and military activities associated with dispensaries,

-- Methods for evaluating physical and psychological capabilites with system-wide long-term medication and,

-- Recommendations based on military-medical and professional practice on the deployment of the less able.

From what has been said, it can be concluded that the realization of the correlation between military-related medical care and the increase in fighting strength and combat readiness is a process that is in a constant state of perfecting itself, a process that requires the close cooperation of military-related hygienic and professional representatives of military-medical clinics. Of decisive importance is the complex application of the various research findings into military practice in order to thus continue to establish scientific preconditions for the steps taken by the military doctor in military-related medical care.

POST-SYNOD CHURCH-STATE RELATIONS PROMISE LITTLE CHANGE

Lutheran Leadership Views Cited

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 4 Feb 86 p 5

[Article signed "K.A.O." datelined Berlin, 3 Feb 86: "Bishop Leich Objects to Sense of Resignation"]

[Text] The number of votes cast in the Conference of Evangelical Church Leaders in the GDR for Bishop Leich as chairman is not known, since the election was secret. But Bishop Leich in his speech to the synod expressed his thanks "for the clear-cut type of election." This indicates a convincing majority. The bishop stated in his inaugural address that the church in the GDR lives in a state ruled by a strong ideology. It is necessary to continue what the Federation of Churches has said and done so far. He also admonished: "When we talk to representatives of the state, we should see them as people concerned for the welfare of the citizens."

Bishop Leich's speech was an exhortation not to yield to a sense of resignation in the church. The missionary situation in which Christians in the GDR live is "determined by the presence of Christ wherever two or three are assembled in his name, and by his order to win disciples for him." In the GDR "the ground is broken. Although there are no direct questions for the church, there are questions which render the public more open to the church." The church can only win people to faith in Christ if it is "unequivocally clear and binding in preaching the Gospel and administering the sacraments. The question about truth is answered through Christian testimomy and life." Leich closed every paragraph of his speech with the call to read in the Bible and to hold fast to prayer. The sentence sounded like a motto to guide his work as chairman of the Federation of Churches.

The bishop advocated ecumenical rapprochement and, in particular, fellowship with the Evangelical Church in the FRG. Here, also, advances can be made only "if we strive and pray for the truth of God's word." Leich pointed to Gorbachev's disarmament proposals. Confidence is growing that the road to the future "is not quite so hopeless."

At the synod of the Evangelical Federation of Churches in the GDR, held at the Stephanusstift in Weissensee, secretariat manager Ziegler gave an interim report on the 4 months since the meeting of the old synod in Dresden in September. The Federation of Churches is seeking cooperation with the other churches in the GDR to make a special church contribution to the "Year of Peace," the United Nations having thus designated the year 1986. Picking up on a statement of the last synod, it is proposed to put these church events in the GDR under the motto: "Time for Peace." Observations made at the last "peace decade," the annual 10 days of church events for peace, jointly prepared with the Evangelical Church in the FRG, were confirmed in the report to the synod: the peace decade with discussions, seminars and church services has become a solid tradition in the Evangelical Church in the GDR and is carried out in ecumenical cooperation, as far as possible; but interest is flagging in some parishes. Prayer for peace is gaining in importance. This is to be taken into account for the peace decade in late autumn. "Peace be with you" has been proposed as the theme in the GDR.

At the next synod meeting in September, a church committee appointed 3 years ago will present the result of its consultations on the "problem of profession of faith in the peace question." It deals with a question which constantly occupied the last synod in the GDR during its term of office: in view of nuclear weapons, can Christians continue to participate in the system of military securing of peace? The Evangelical Church in the FRG considers both Yes and No to the policy of nuclear deterrence as a means of securing peace as compatible with Christian faith, at least as long as efforts are made to reduce armaments. In contrast, the Federation of Evangelical Churches in the GDR has officially declared conscientious objection as "the clearer sign" of Christian faith. But only the committee report, to be given in September, and the subsequent discussion will show whether the Evangelical Church in the GDR will make a binding decision in this question. For the present, the answer is still valid which the old synod gave in Dresden in September of last year: "Today, no unanimous answer to this question is discernible."

The manager of the secretariat dealt with the increase in arrests of conscientious objectors which became known in Dresden during the final session of the old synod. Ziegler stated that church representatives "had supported those concerned in an appropriately unobtrusive manner." He thanked the government representatives for the quick release of those arrested. This decision shows "understanding and magnanimity" and has prevented hardships and burdens. Ziegler said: "We take these decisions as a sign of willingness to solve conflicts within the framework of existing regulations, and to prevent the creation of conflicts. We thank you for this willingness." It "makes us confident that ways of understanding will be found in as yet unsolved issues, even if at present the unmistakable refusal continues to the pleas of the synod for establishing an alternative civilian service and for the possibility of weaponless service for reservists already sworn in."

Ziegler also reminded his listeners of Bishop Hempel's request for a new talk of the leadership of the Federation of Churches with Honecker. In principle, Honecker had agreed to this in a conversation with Bishop

Hempel a year ago, but no date or subjects have been agreed on. Another request to the government was also mentioned in the report to the synod: The Federation of Churches gave Premier Willi Stoph a list of 123 church buildings in dire need of repairs. It is necessary that the state 5-year plan 1986 to 1990 provide for "building funds" in the amount of 47 million Marks, whereby the difficulty is less the lack of money than the lack of construction workers and material. The collapse of the Marienkirche in Pasewalk demonstrated the consequences of neglecting existing buildings in the GDR for the churches and the public. In many towns, churches are the only monuments still preserved from the Middle Ages, a cultural heritage whose preservation is valued by the GDR.

FRG Commentator's Assessment

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 5 Feb 86 p 5

[Article by Karl-Alfred Odin, datelined Berlin, 4 Feb 86: "The Church in the GDR is Sticking to its Course"]

[Text] The change in the leadership of the Federation of Evangelical Churches in the GDR at the synod in East Berlin does not indicate a break, although only one of the five members of the new board, Consistorial President Stolpe, also served on the old board. The election of Thuringian Land Bishop Leich as chairman meets the expectation of the synod. The former chairman, Saxon Land Bishop Hempel, himself wanted Leich's election. No other proposal had been given serious consideration. Leich is attached more strongly to the traditional forms of the church than Hempel, but there is no difference between the two bishops in their spiritual, church and political attitude. Since 1978, Leich has participated in decision-making in the Conference of Church Leaders, the managing institution of the Federation of Churches. His two deputies are familiar with all matters of the Federation of Churches: East Berlin Consistorial President Stolpe from the founding of the Federation of Churches in 1969 until 1981, and Saxon Province Bishop Demke, from 1981 to 1983,was manager of the secretariat of the Federation of Churches, the coordinating center of this union of the eight Land churches in the GDR.

The intent of filling the three managing positions in this manner is unmistakable: the Federation of Churches is continuing its course, in the church, in its relations with the state, and in standing up for all those suffering for personal or political reasons. In Leich's address after the election, the spiritual and missionary task of the church occupied first place. Even more strongly than up to now, Leich will direct the forces in the Federation of Churches toward the core of Christian existence, to preaching, to the Bible, to prayer. Among the eight member churches, unity in practical church tasks has not kept pace with the theological closeness among them. Although the synod in Weissensee was primarily concerned with elections, it made clear that it will continue to pursue the goal of leading the Land churches in the GDR into a full church community, step by step. In theory, this community was already preempted in September, when the old synod at Christ Church in Dresden decided to adopt the name

"Evangelical Church in the GDR" for the Federation of Churches. The fact that the council chairman of the Evangelical Church in Germany, Bishop Kruse, was invited to the meeting, and many statements made at the synod show that the Evangelical Church in the GDR needs the connection with the Evangelical Church in the FRG. When the churches in the GDR freed themselves from the organizational clutch in 1969, it helped them to gain freedom of action and internal strength not only for political reasons but also for their own church concerns. At the same time, this departure made possible a more relaxed relationship with the churches in the FRG.

A part of the continuation of its course in political matters is that the Evangelical Church recognizes the GDR as its state. It does not see itself as a church against socialism, or as a socialist church, but rather as "church in socialism," as it was formulated a quarter of a century ago. In the Evangelical view, this includes the duty to publicly criticize shortcomings not out of enmity but out of loyalty to the state, in order to help improve conditions so that people voluntarily want to live in the GDR. The synod called to mind Honecker's promise of equal rights, equal respect and equal opportunities for Christians in the GDR. Just before the synod, NEUES DEUTSCHLAND had published a declaration by Bishop Leicht which reiterated Bishop Schoenherr's old saying "that the relationship between state and church must be measured above all by how it is experienced by citizens and parish members in their daily lives."

Concern at the synod in Weissensee was directed in particular toward conscientious objectors. Besides the discussion of personnel, it was the only subject where the public was excluded on two occasions so that the synod could discuss it in full freedom. The synod expressed the church's thanks to the Evangelical Young Men's Association and to lawyer Schnur of Rostock for their help for the young men.

It is uncertain if and when the planned talk will take place between the chairman of the Council of State and the chairman of the Conference of Church Leaders. Bishop Hempel told the synod that one of the essential conditions is that such a talk must have visible results for the parishes. Advice coming from outside the synod to avoid agreements with the state and to withdraw behind the church walls is unacceptable to the Evangelical Church, whose membership embraces half the population. The example of the Catholic Church, which set the "Bengsch course" (named after the deceased cardinal) against the "Schoenherr course," i.e., the attempt at relatively getting along with the state, has never even been discussed, let alone accepted, by a synod of the Federation of Churches. At this synod in Weissensee, also, was stressed the value of having the state as a partner in dialogue in at least some of the conflicts.

SMALL FARMERS GROUP BECOMES MEMBER OF DEMOCRATIC BLOC

Cologne DEUTSCHLAND ARCHIV in German Vol 19 No 1, Jan 86 (signed to press 30 Dec 85) pp 16-17

[Article by Dr Peter Joachim Lapp, member of the East-West editorial staff of the Deutschlandfunk in Cologne: "The VdgB [Peasants Mutual Aid Association] a New Member in the Democratic Bloc"]

[Text] For the first time since the early 50's, the "Democratic Bloc of the Parties and Mass Organizations" in the GDR was enlarged:

"According to an application, the Peasants Mutual Aid Association (VdgB) as socialist mass organization of the cooperative peasants and gardners was admitted to the Democratic Bloc."[1]

As is known, the "Democratic Bloc" (DB) is a consultative body under the control of the SED, which exists on republic, bezirk and kreis level. In addition to the SED it includes the four other GDR bloc parties, CDU, LDPD, NDPD, DBD, as well as--now--five mass organizations (FDGB, FDJ, DFD, KB, VdgB).[2] Each of the parties and organizations delegate four representatives of their leadership to the DB. The meetings take place sporadically under alternating chairmanship; DB resolutions must be made unanimously. The SED regards the DB as "core of the GDR National Front" and as a device to make its will effective with the help of this body throughout all of the society.

"In the Democratic Bloc fundamental questions of domestic and foreign policy, basic draft laws as well as other state documents are discussed. Hereby the collaboration necessary for their implementation is coordinated.... The Bloc discussions further relate to joint social activities."[3]

Thus in the future the VdgB will participate in these discussions. The organization, practically a GDR peasant association, now numbers just short of half a million members. Originally in 1945/46 founded above all to help destroy the "Raiffeisen" Association of Farmers Credit Cooperatives, the VdgB in 1950 merged with the "Peasants Trade Cooperatives" (BHG) and in subsequent years massively carried on the SED agricultural policy, which finally in the spring of 1960 ended in full collectivization.

Thereafter the importance of the VdgB/BHG declined; in 1963 the organization lost its parliamentary group in the GDR People's Chamber and its deputy seats in the bezirk assemblies.

Since mid-1982 the SED reactivated the VdgB, which--as all mass organizations--is under the control of the SED. The reasons for the revival cannot be completely determined. One thing is certain, namely that the VdgB is the only association that feels especially obligated to the agricultural area, under production and distribution aspects as well as also under political and cultural aspects, as Dietrich Staritz emphasizes.[4] And the SED continues to strive towards leveling the urban-rural difference, especially in the services and cultural fields. Such an expression of intention is also included in the new VdgB statutes of 1984.

The first secretary of the central executive of the VdgB/BHG summarized the tasks of his organization as follows:

"In first place for the VdgB is the task, under the leadership of the SED party organizations, to support the political mass work in the villages and as a socialist mass organization to contribute to developing the creative initiative of the cooperative peasants and gardners in increasing agricultural and gardening production.... At the same time, the social participation of the cooperative peasants in social life in the villages is to be promoted."[5]

The VdgB is charged with the responsibility of closely cooperating with the other mass organizations. With more than 7500 local organizations in the villages, it is regarded (once again) as a "social force"[6]; the SED utilizes the VdgB's manifold supply facilities in the countryside.

As part of the reactivation, the leading party in the GDR repeatedly upgraded the VdgB: Thus the SED in the latest communal elections in May 1984 increased the number of the VdgB seats by 70 percent.

If the development continues in that direction, it is feasible that the VdgB will get a parliamentary group of its own in the People's chamber and deputies of the organization will enter the bezirk assemblies. However, ahead of the coming "people's elections" on 8 June 1986, the "distribution key" (on which the DB also decides in final arrangement) would then have to be changed in the near future. New seats for the VdgB are likely to be at the expense of the other mass organizations (as was the case in the 1984 local elections).

The revival of the VdgB/BHG must be most distressing for the "Democratic Peasant Party of Germany" (DBD). Until now this party claimed to speak for the cooperative peasants in the DB and otherwise; thus far it was courted by the SED as "party of the class of the cooperative peasants." Apparently this second largest GDR bloc party with 110,000 "party colleagues" has not been able to completely fulfill the expectations of the SED.

Undoubtedly the membership of the VdgB in the DB (to which it had not previously belonged, not even when it held seats in the People's Chamber!) has completed the system of the "political organization of socialism" in the GDR and as a result will contribute to increasing its "political elasticity" (Dietrich Staritz).

It is possible that the delegates of the VdgB/BHG in the DB will more intensively take care of the everyday problems of GDR agriculture than other delegates, who until now--except for the DBD people--had to go into this matter only as a sideline.

BERECZ DISCUSSES POLITICAL ISSUES

Budapest PROPAGANDISTA in Hungarian No 6, 1986 pp 5-16

/Article by Janos Berecz: "About the Political and Ideological Program of the 13th Congress and Its Representation in Foreign Propaganda"/

/Text/ Conference of Propagandists, 3-4 July 1985: On Some Timely Issues of Foreign Propaganda and International Information

Propagandists working abroad and for abroad held a 2-day conference on 3-4 July 1985 in Budapest, at the Educational Directors' Headquarters of MSZMP. The conference was opened by Erno Lakatos, head of the Propaganda Department of the Central Committee of MSZMP. Following it, consultations were given by Janos Berecz, secretary of the Central Committee of MSZMP, Pal Ivanyi, deputy head of the Economic-Political Department of the Central Committee, Judit Csehak, deputy president of the Council of Ministers, and Geza Kotai, head of the Foreign Relations Department of the Central Committee. On 4 July propagandists discussed their experiences in sectional meetings. As a conclusion, Janos Barabas, deputy head of the Propaganda Department of the Central Committee gave a summary lecture on the present issues of our country's foreign propaganda and international information. Below is a presentation of the main ideas put forth by Janos Berecz.

In his introduction the lecturer announced that he wanted to outline three topics. First he was going to review the most important events of domestic politics during the past 3 years and the experiences related to them; then he was going to examine those political issues with ideological significance that are related to the 13th Congress; and finally, foreign propaganda was going to be discussed in this context.

Of the important events of domestic politics in the past year Janos Berecz dealt with three: with the commemoration of the 40th anniversary; with the 13th Congress; and with the elections. He emphasized the following:

The 40th anniversary of our country's liberation gave us an opportunity to face our recent history and its values and important lessons. Fortunately, we are moving away from just celebrating anniversaries; now we use anniversaries primarily to take stock.

The 40th anniversary gave us a chance to straighten out a few things in our historical perception. The first thing--that I would call straightening out--is that we have succeeded in demonstrating and proving that the liberation of our country was not an event tied to just one day, but it was a longer social, political, and military process. The military process was opened and closed by the Red Army of the Soviet Union that after more than 6 months of heavy fighting expelled from our country the German invaders and Hungarian riff-raff allied with them; fascist, semi-fascist, and semi-feudal capitalist masses. This struggle claimed a great many victims of the Soviet Union--and of Hungarian society as well--but it gave an opportunity to open up a political and social process. By putting our national sovereignty on a new foundation we were successful in creating a kind of a people's rule, we succeeded in widening the military process of liberation into a social liberation--and in a few years we successfully turned all this into a workers' rule. The new system was not a gift, it was achieved by the most progressive Hungarian democratic forces, communists and other democrats. This is how the liberation became a national cause; the Hungarian nation could live with its freedom.

The events of the commemoration also gave us an opportunity to evaluate the history of forty years, to accept what we had to accept and live with the consequences. We have proved that these forty years were decisive in the history of Hungarian society. We are speaking of the most fruitful four decades of our national history, including not only the positive, but also the negative events and their lessons. We had to accept that this time period was the period of fighting for power and establishing social democracy; for us this has stayed the basic question when discussing the nation's present and future and its socialist tasks. Along with gaining power and developing social democracy, and in order to guard them, we also established new types of ownership, collective social property, on which the creativity and the program of a socialist society are built. We had to accept, and we did accept, in this time period the tough class struggle that ultimately took a new turn with the establishment of the workers' rule--and which, regrettably, was followed by a dogmatic, bureaucratic distortion. In the end this difficult time period and struggle were replaced by a policy aimed at establishing socialist national unity and common agreement, and by the implementation of political means and methods that were not alien to the nation but met with the support of the Hungarian nation and which allowed for and made necessary active and wide-ranging political activities by the Hungarian Socialist Workers' Party.

With all this we demonstrated that these 40 years belong to us totally. It was during this time that we truly developed a sensitivity to both sides and learned to fight on both fronts, and we learned that along with the accomplishments we had to accept the historical legacy of tragedies and conflicts. We completely reject a bureaucratic, distorted way of exercising power, yet we are not willing to turn away from our socialist accomplishments and national values that were born in that time period. We do not let a whole nation feel guilty because bad, deformed policy and political leadership abused the people's confidence. We cannot break down these 40 years into days and pick and choose saying "I will take this, but not that." This time period is as much an integral part of the history of the Hungarian nation as was the 1848-49 war of independence and the time period following it, or 1918 and 1919 and the historical time period that followed. They had their burdens, lessons, and revolutionary results. These four decades were the most creative time period in Hungarian history and so rich in lessons that with adequate learning we can confidently build on them. The policy of the Hungarian Socialist Workers' Party and the relationship between the party and the masses are the guarantee that these lessons are heeded and no more tragedies will be allowed in widening our experiences in building socialism. The most important things are work and creativity, and today in Hungary they are both built on socialist national unity. It was in this spirit that the 13th Congress evaluated our past and defined the future.

The 13th Congress of the Hungarian Socialist Workers' Party assembled in a complicated world situation and rather difficult political climate. The success of this great task proves the strength of our party and its relationship with the masses. During the congress society showed increased interest, political activity and readiness--and the congress's stand became a defining and influencing factor in public opinion. Not only the reports but speeches as well were critical and self-critical, and it is of utmost importance that in the end the congress provided an action plan answering current questions. And although it is in the nature of the MSZMP's policy to express the dialectic of continuity and renewal, this is the first congress that defined it so clearly what renewal meant--and that renewal was needed. This spirit was felt in the speeches and the program itself; now it is out task to represent and indeed implement this program of renewal.

The program is an integral part of developing social democracy, and it marks its direction. This is an extraordinarily important element. In a more difficult situation, in a time period demanding stronger leadership it is easier to think that a tougher, more controlling leadership is not compatible with social dialog and discussion of problems, a more lively political atmosphere and a say in matters, but that the situation demands a period of very strict and unequivocal commands. The congress took the unequivocal stand that the more difficult the tasks and the more layered the social problems, the more we need creative spirit, educated people and working hands. The only way to mobilize these forces is to make people feel that they are a part of shaping politics, and that they are participating in decisionmaking just as much as they are in carrying them out.

Another issue of the congressional program was the definition of economic vitality. Politics do not give an order to economists and experts on economics to produce a 3-percent annual growth; economic growth opportunity does not depend on orders and demands. But we do define and convey the social demand that to achieve our goals we would need a 2.5-3 percent annual growth rate in the 7th 5-Year Plan. It is the task of experts on the economy and economic strategists to find all the possibilities to achieve it.

In summary we can say that the congress resulted in great social activity and its resolution met with approval. But it would be a mistake to think that all we need to do is to introduce a few measures, and the program will be implemented. To a certain degree this indeed does depend on measures--but only to the degree to which they will result in increased social activity and the practical development of creative activities of the masses. All programs are achieved through social activity and not through incantations, prayers or measures. Of course, we need those too, measures, for instance, that make our social policy modern. We also need a program to fight inflation, and in some areas--like science and technology development--we need to bolster development. For all this it is essential that we work out specific programs. But all this only makes sense if it strengthens the practical activities of workers' collectives and individuals, and it if encourages and helps social activity. The third great social event, the elections, was characterized by lively political interest. We had not seen the kind of active, interested forums in the past few decades--not even in the time period of the MSZMP--that we saw in the recent nominating meetings. People were interested in the candidate and his program; a certain political and personal rivalry has become a fact in our public life. Of course, we are just learning this, but it is clear that people attended these meetings not because they were forced to, but because they wanted to, out of genuine interest and political activity.

It is characteristic that this time in the elections along with the policy the politician was evaluated and judged as well. And it is a lesson that the two evaluations did not always correspond. There were some great surprises and we had to realize that people would not tolerate just political representation without personal respect. It happened that while at one place a national functionary was gladly elected, in another voter precinct a similar candidate was rejected. From this point of view--as it was later voiced in the Central Committee's evaluation as well-- it is a great lesson that along with politics the behavior of the person representing those politics is increasingly being considered, judged or appreciated.

In a certain way, the elections also meant a challenge to party organizations. We have been challenged specifically as well; either in the way that the candidate was judged acceptable but new ones were proposed as well, or that the Patriotic Front's candidate was not accepted, and this is why new candidates were introduced. In some places we encountered organized opposition to our candidates. It is natural that in these cases the affected party organization did not hesitate to take action. It makes one thing, though, why some people considered this anti-democratic.

Finally about personal and political rivalry: the elements of some kind of socialist electioneering were emerging. We could be far from being satisfied, because it was too late when we realized that certain rules should have been worked out beforehand. We hung on to equal opportunity; in the end to such a degree that at times we overshadowed colorful personalities, attractive candidates. We forgot that equal opportunity is a legal concept, and ends as soon as political competition starts; when one has to stand up and explain things some people are genuinely better than others.

The lesson from all this is that today we cannot conduct politics the way we did yesterday. The most important result in our opinion is that a national political dialog took place between the party and the masses. We could say a great many things about the congress, our program, the work facing us: we took advantage of publishing the resolutions of the 13th congress much faster than at any time in the past.

Of the political and ideological questions of development Janos Berecz also dealt with three: with the relationship among ideology, politics, and social practice; with the direction of social democracy; and with the complicated topic of the relationship among nation, national value and socialism. Among other things, this is what he said:

It is not enough to look at and examine the relationship among ideology, politics and social practice only from the viewpoint of the latter. This is particularly important in order to strengthen the socialist community and to better understand one another's practice, to establish the unity of principles.

As far as ideology is concerned, it is almost completely identical in the various socialist countries, this is the theory of Marxism-Leninism. The "almost" refers to the fact that in understanding new social experiences there may be ideological differences in some issues. These are transitory until they become shared values, or it becomes clear that they are specific, national and characteristic.

This process took place easily in the communist movement while it had some kind of designated or chosen center. Then that was what decided whether something was general or specific and the action depended on this determination. A center today is not necessary and we do not want one. This is why the generalization of experiences, their becoming shared values and their preservation at a certain level are a more complicated process. The ideology is shared, we are speaking of the basic tenets of Marxism-Leninism. What we do we do with the conviction that we are applying the general teachings of Marxism-Leninism specifically to Hungarian national circumstances on the basis of our own experiences and knowledge.

But in politics there are and there can be differences--even conscious differences. In foreign policy there are no differences, our international political goals are defined in the same way as any other socialist country's. In other areas of politics, however, particularly regarding political consequences of international conditions, there may be differences. They are not theoretical differences, but they are significant. Moreover, in some respects there may even be theoretical differences, such as, for instance, when discussing attitudes toward the concept of reform. These differences do not separate us, they are due to national conditions stemming from the same ideology.

Social practice is multicolored and changeable. Implementing socialism is not the same everywhere. Comrade Janos Kadar worded it this way at the 13th congress: "We do not have a dogma but a creative theory." Of course it is a historical fact and reality that the beginning phase of socialism was not characterized by variability, it was the other way around. But as the opportunity started to present itself to perceive dialectically our dialectic theory, and we started to implement it to our reality that way a multicolored socialist process got under way. In this respect we have to establish emphatically that there is no Hungarian model. There is a Hungarian solution, but it is not necessarily good for anybody else. Let us not try to find ourselves in others, and let us not force others--even just as an inner compulsion--to like our practice and learn from us. But let us be open to implement others' good methods, let us take over from our friends that which works better than ours.

A much debated theoretical issue is socialist democracy. It is important for us to deal with this because the bourgeois standard of pluralism was somewhat forced on us. The dogmatists are afraid of the whole thing, and have only one question: Does the party exert indirect leadership? If it is not indirect, then the party has a problem with its leading role. Believers of the opposite extreme, some "searchers" are saying that there is only one standard: political reform, i.e., the start of a reform of our political institutions.

The 13th Congress of the Hungarian Socialist Workers' Party aligns itself with neither. In the center of our political democracy is the conviction that in order to realize the pluralism of political interests we have to create socialist unity in our institutions, in our case, in a one-party system.

This is not easy, and we know that it has its dangers. It requires the constant maintenance of national unity, the continuation and enrichment of federal politics established 30 years ago. It also means the continuous development of the system of political institutions, but not its fundamental reform.

Our goal is unchanged: the development of Marxist self-management of society through enriching socialist democracy. The party's leading role in this cannot be questioned, the party's conscious activities define the framework within which society develops and socialism is built. At the same time it is necessary that cooperation and social practice be developed among the 3 institutions of practicing power--the party, the government and social institutions. It is becoming increasingly more necessary to exercise the party's leading role through means of social movement, which by its nature is more difficult and indirect than direction from the height of power. We have to get used to this. It is important, for instance, to adjust party education accordingly, to teach not only general theory and ideology, but concrete politics and behavior. Because even harmless dictates will be considered an abuse of power--and the harmful ones even more so. If we want to go with all of society, we have to distinguish ourselves through mental maturity, better style and more active political work.

The government has two very important sides: one is the activities of the organizations of people's representation, and the other is the work of the executive institutions. It is clear that the organizations of people's representation cannot function the way they did yesterday. The process of subordinating the apparatus to the councils will have to take place. And finally, from the point of view of democracy we took a very significant step forward in production. Only 27 percent of our enterprises will stay under state direction, 47 percent will be under council direction, and 26 percent will be directed by elected leaders. This will have an effect and meaning, if we can solve our economic tasks better, and if our party's efforts of actively involving workers in social activities will be expressed in it.

The third important ideological question is the relationship to national value and socialism. In the past years a process took place that is going to strengthen in future years. In this process we not only consider socialism a national value--and the program of socialism a national decision--but we can bring our national values and traditions in line with socialism; in line with socialism's ideology and concept--and with the social practice of socialism.

This is not easy, as we have traditionally been afraid of nationalism. And it is necessary to be afraid: on the one hand, particularly under conditions of the extraordinarily many negative historical experiences of the nations of this region, and on the other hand, because there is still the tradition here of looking at who is smarter and who has been around longer. It is not easy in this region to be both Hungarian and international. I only want to repeat that the process has started--and we want to encourage it--in which the implementation of the socialist program enriches the Hungarian nation, and all the values of the Hungarian nation enrich socialism. We reject nationalism, but let us fight nationalism by strengthening our socialist commitment to our nation and our international connections with other nations, particularly and primarily with the Soviet people.

Speaking of the ideological struggle, the lecturer emphasized that our fundamental stand is unchanged. First of all, this means that the Hungarian Socialist Workers' Party does not give up its position that there is an ideological opposition between capitalism and socialism, and social struggle and political debates are taking place.

Second, we do not give up our basic position that the solution to this opposition can only be found in the area of social practice, and not in disruption, that is, in the escalation of military opposition, meaning war. This would not solve the situation, instead it would mean mankind's destiny and the end of its future. Therefore we are ready to debate, and in order to do this, contact is needed.

Third, cooperation is also necessary. Because in order to avoid military conflict, to conduct debates, contact is essential. And the nature of cooperation requires interest alignment. Alignment of political, economic, and ethical interests.

This is why we have established previously, that in order to solve the major issues of international politics we have to forego direct ideological interests. It is a great pity that the government of the United States started to enforce ideological values and interests in international politics precisely at the time when we discovered this important lesson. Today it is their political attitude that is ideologically motivated; we would like to separate the two because we feel that extraordinarily great and important issues are facing mankind and they cannot be solved directly, ideologically.

If we adhere to these three basic things, we are less likely to fail in our concrete behavior. I would like to add that there is a need to develop the culture of opposition within the framework of cooperation, particularly in debates. We have to achieve a high standard and civilized behavior in class struggle; a small nation should not be tough, but it can be very smart.

CORRESPONDENT CLAIMS U.S. FUNDS AID 'SOLIDARITY'

Warsaw TRYBUNA LUDU in Polish 28 Nov 85 p 7

[Article by Marek Jaworski: "Washington's Money for 'Solidarity' in Paris"]

[Text] France has a new political scandal made public by the left-wing newspaper LIBERATION which devoted as many as six pages to the affair in its 27 November issue. The article also contained photocopies of various documents.

As it turns out, one episode of this affair concerns a method used in financing the Paris based emigre committee of 'Solidarity' and other anticommunist groups in France.

The Parisian 'Solidarity' committee always maintained that its material existence rested on "fraternal" donations from certain French union offices and in particular from the General Confederation of Enterprises' "Workers' force" (FO). Today, however, we know that this money came directly from Washington. The FO, between April 1984 and April 1985 alone, received $830,000 from the United States for this purpose. A second French organization receiving generous assistance from the U.S. is the ultra-right student organization, the National Intercollegiate Union (UNI). During the same period, they received $575,000. It is worth adding that this organization numbers no more than several hundred members.

These donations were surreptitiously delivered to France by the National Democratic Trust established at the initiative of President R. Reagan and affiliated with America's AFL-CIO. The Trust has the status of a private organization but is funded entirely by the government. It is evident from the photo-copied documents that this organization finances anti-communist activity in nine countries (France is placed on the list between Poland and Portugal). Besides the FO and UNI, other French beneficiaries from this fund include, to a lesser degree, the Institute of Social History (which does work primarily on socialist countries), an emigre Vietnamese anti-communist organization, the International Association for the Defense of Human Rights and the Sino-Soviet Institute.

LIBERATION's published articles, documents and interviews with representatives of the AFL-CIO and FO clearly show the purpose for these funds from the U.S.; they are to be used in the battle waged against communism. Andre Bergeron, FO president, did not hesitate to confirm the subversive character of Paris' 'Solidarity' committee and openly stated that much of its funding comes from his organization. Naturally this money is flowing to France from Washington as it was in the earlier period. These donations did not end in April 1985 but are continuing.

This matter, which the French mass media is also calling scandalous, clearly points to an interference in the internal affairs of France. One aim of American financial support is to assist the FO in its battle with the left-wing General Labor Confederation [CGT] and their official purpose, as stated in published documents, is the necessity of "defending democracy in France".

POLITICS POLAND

STRONG LIBYAN TIES DEFENDED

Warsaw ZYCIE WARSZAWY in Polish 22 Nov 85 p 6

[Article by Franciszek Nietz: "A Proven Friendship"]

[Text] "The words 'Poland' and 'Pole' are primarily associated with the significant assistance they provide in realizing the ambitious plans of the Libyan revolution. The Libyan people consider the Poles great friends. Their reliability in fulfilling assigned tasks, their promptness in meeting deadlines of every undertaking, all of this produces a feeling of genuine fondness and recognition" stated Abu Bakr Abu Shama, secretary general of the Society for Arab-Libyan-Polish Friendship, during an interview with ZYCIE WARSZAWY.

These sentiments have endured for many years. Friendly relations between the socialist people's Libyan Arab Jamahiriyah and Poland have remained stable and politically valuable to both Warsaw and Tripoli, despite the economic hardships faced by both countries.

People's State Council president, General Wojciech Jaruzelski's announced visit to Libya represents a formal return of the visit made by Libyan leader Colonel Muammar Qaddafi to Poland in September 1982. It will confirm this stability in relations and provide a stimulus to vitalizing and increasing economic cooperation so advantageous to both countries. Both capitals express the belief that there continue to exist significant possibilities for expanding the scale and nature of this cooperation, the framework of which was outlined during the forementioned visit by Colonel Qaddafi to Poland on 9-10 Sep 82. The protocol signed at the time contained among other things, a program to increase cooperation in the industrial sector, to fulfill a number of Polish investment projects in Libya and to increase the number of Polish skilled workers employed in that country.

Financial problems have recently forced the Libyan Government to an inevitable revision of ambitious investment proposals and to slow the rate of economic development. This does not indicate, however, that it will abandon long-range plans for rapid industrialization and agricultural development. One reason for this is the prediction by some economists that in 2 years, after a period of necessary economic restraints, one can again expect an increase in revenue. Tripoli does not intend to make any revisions in its contacts with long-standing and trusted partners, our country most certainly among them, as a result of temporary difficulties. Both capitals, in addition, agree that increased Polish-Libyan cooperation, both in practice and scale, may contribute to speedier resolutions of economic difficulties in each country.

The existing balance in cooperation between the two countries was reached during last year's session of the Libyan-Polish Committee for Economic and Scientific-Technical Cooperation. Outlined during this time were the form increased cooperation was to take, an agreement regarding the scale and nature of bilateral trade, settlement on the means and principles of repayment and an agreement regarding the scale and nature of bilateral trade, settlement on the means and principles of repayment and an agreement regarding the export of Libyan oil to Poland. Our exports to Libya for the current year (according to initial estimates) should gross approximately 250 million dollars. Of this total, 60 million dollars was for the export of goods and 40 million dollars for services.

At present some 9,000 Polish skilled workers are under contract in the Socialist People's Libyan Arab Jamahiriyah. In the health field alone, there are some 1,500 doctors, laboratory assistants and nurses. The majority of our countrymen, however, are employed in construction. Polish construction workers, under BUDIMEX contract, have built scores of agricultural farms and hundreds of apartment buildings in Benghazi and other Libyan cities. Additionally, DROMEX is well known for having built thousands of kilometers of road since 1982. Other examples of work completed by Polish experts are a cement plant in Derna, a generating station in Homs and a floating waterfront in Tripoli and Benghazi.

The export of Polish services to Libya in the future should continue at the present level and may possibly increase. Our country depends on a positive examination of bids to secure contracts for constructing industrial structures in their entirety. Planned undertakings worth mentioning include a factory for the manufacture of ceramic tile and dinnerware. New bids by BUDIMEX and DROMEX are still pending. Let us add that besides services and construction, Polish exports to Libya consists of construction and road machinery, motorized equipment, cable, pharmaceutical items and sugar.

Brisk trade and economic and scientific-technical cooperation promote excellent political relations between the two countries. The governments of the Socialist People's Libyan Arab Jamahiriyah and Poland display identical or compatible views on important issues concerning international politics. This was evidenced during Muammar Qaddafi's visit to our country and is a result of political policy. During his visit, the Libyan leader stated, "We are a people who believe in the principles of friendship and are incapable of betraying that friendship. Our trust in you strengthens as we become familiar with the good, progressive tendencies and directions which are being realized in your country."

Similar beliefs are shared by both countries and are based on a mutual understanding of problems faced by all peoples. The Libyans are pleased to receive Polish support in their activity of unifying the progressive forces in the Arab world. Both of our countries are opposed to the U.S. administration's attempts at interfering in the internal affairs of other countries. Libya and Poland have had bitter past experiences with such attempts, for instance, economic restrictions imposed on our country, and the CIA's recent assassination attempt against Muammar Qaddafi.

Tripoli and Warsaw have consistently condemned Israel's aggressive annexationist policy and the racist regime in Pretoria. Poland and Libya stress the significance of the peaceful efforts made by socialist countries aimed at reducing and stopping the arms race. Close and friendly contacts exist between each country's delegation at the Disarmament Conference. One of the fundamental principles of Libyan foreign policy is extensive cooperation and friendly relations with socialist countries. The most recent example of Libya's consistency in putting this principle into practice is Colonel Qaddafi's October visit to Moscow where he discussed bilateral concerns and current world problems with Soviet leaders.

During the height of economic restrictions and an extensive anti-Polish campaign led by the West, distant Libya stood behind our country and expressed her support for all measures taken to bring about a normalization of our situation. Colonel Qaddafi had stated that "Poland is a country dear to the hearts of Libyans. The domestic crisis in Poland concerns Poles alone and should not become a target for imperialism." Polish-Libyan cooperation and friendship have extensive political and moral foundations and the planned visit by the President of the People's State Council, Wojciech Jaruzelski, will only serve to strengthen this.

PEACE EDUCATION SYMPOSIUM CONCLUDES

Warsaw RZECZPOSPOLITA in Polish 28 Nov 85 pp 1, 2

[Text] A symposium devoted to the problems in peace education concluded on 27 November in Cracow. Taking part in the 2 day debates organized by Jagiellonian University and the Military Political Academy were distinguished military and civilian scholars, experts in the fields of sociology, psychology, pedagogy, political science, history and philosophy, as well as students from the Academy.

During a discussion on the problems connected with the idea of peace in the national consciousness of Poles at the turn of the 19th and 20th centuries, Lieutenant-Colonel Jerzy Kazimierski stated that a feeling of security in a divided world is relative and not to be assumed to last forever. However, even in a situation of long lasting peace (in regard to Europe) there occur unfavorable conditions which give rise to the opinion that peace can be threatened.

During the symposium which the UN accepted in form and called forth by Poland with a "declaration to prepare society for a life of peace", many problems were raised which revealed the causes of war and which had a deciding influence on the development of peaceful ideas and in educating the young in a spirit of peace.

Soviet research on the dialectics of war and peace were discussed by Colonel Ryszard Rosa. The foundations of a peace policy in socialist countries, as opposed to capitalist, lie solely in the principles of a socialist system which is based on the rule by the working class, a Marxist-Leninist ideology condemning the use of violence and coercion in relations between people, nations and races, and a propagation of humanistic ideals and a world without war and social injustice.

Letters from Politburo member, KC PZPR Secretary Jozef Czyrek and from the chief of the Polish Armies' Main Political Directorate [GZP WP] and deputy minister of national defense, army general Jozef Baryla were read to those attending the symposium.

The KC PZPR Secretary stated: "Our party and country will always stand in the defense of peace and make the education of society in the spirit of peace one of the primary tasks in domestic as well as international politics. I express the conviction that your initiative will meet with a wide response inside the country and be instrumental in propagating the problems connected with peace to groups of youth, teachers and Polish intelligentsia."

The GZP WP chief wrote: "We in the military proclaim ourselves for the peaceful coexistence of peoples and socioeconomic systems based on mutual respect and ideological, economic and cultural emulation, and for weapons reduction and disarmament. Let the voice of Polish scholars confirm the truth of our times, that socialism and peace are inseparable."

BRIEFS

HOSTILE GROUP IN VUCITRN--As a result of action by the internal affairs organs and nationwide defense and self-protection elements, seven persons acting from the position of Albanian nationalism and irredentism for the hostile organization "Marxist-Leninists of Kosovo" and the "Movement for an Albanian Socialist Republic in Yugoslavia" were uncovered and arrested. This illegal group in Vucitrn was composed of Avdulah Zegrova, employed at the "Ramiz Sadiku" construction-industrial combine in Pristina; Enver Ramadani, employed in the revenue administration in Vucitrn; Dzavid Zegrova employed in the "Polet" textile factory in Vucitrn; Abdurahman Madjuni, 4th-year student at the Economics Faculty in Pristina; and Sabit Tahiri, Baktir Haradinaj, and Ljuam Badivuku, all employed as engineers in the galvanized sheet metal plant in Vucitrn. The investigation of the first four persons has been entrusted to Muharem Ramadani, investigating judge of the district court in Vucitrn. We have learned that all members of the group were suspended from the work organizations where they had previously been employed. We have also learned that Ljuam Badivuku was recently set free. The Vucitrn group distributed pamphlets and flyers with hostile content and other propaganda material. The members of this group directed their actions toward consolidating the illegal organizations and groups in the country and abroad into a unified movement, the so-called "National Front for the Republic of Kosovo." The hostile organization, "Marxist-Leninists of Kosovo" acted on the basis of a program and statute and succeeded in forming "so-called central committees in some Kosovo opstinas." Weapons were found at the time of arrest of some members of the organization. Criminal proceedings have been initiated against another 56 persons who have been active in some Kosovo opstinas. NEW PRODUCTS.. p 96

On Our Cover

On our cover are the newest products of REMIX. As a result of the investments and product changes the quality of the modern, new products of Remix is the first--among parts manufacturers--to come up to the international level. The resistor and condenser manufacture based on a Siemens license guarantees reliability and fulfillment of the requirements prescribed in IEC standards. REMIX is going further in development; its hybrid circuit manufacturing plant begins production this year, thus aiding parts supply for our communications industry.

Parts

The Parts Seminar in September gave us the idea of dealing in a stressed way with our manufacture of electronic parts. In the course of collecting articles we found that even at the end of the Sixth 5-Year Plan it cannot be said of our parts industry that it is developing in a lively way. The articles published, each describing some partial achievement, largely reflect this.

Janos Goblos summarizes the new technology for device manufacture and reviews surface mounting. Miniaturization is continuing too and the device manufacturers are demanding new types of parts. In the near future our parts manufacture must prepare to satisfy the demand, prepare to manufacture SMD parts. Both REMIX and the MEV [Microelectronics Enterprise] have begun making preparations and mass manufacture will begin by 1986-87.

The three authors Pasztor, Berkecz and Forrai--who work at the MEV--write about a significant theme, the development of sensors. The resistance thermometer described by them already exists, a semiconductor sensor which could be manufactured. Starting manufacture depends only on demand.

Lajos Kamori writes about the the development of piezoelectric ceramics at KOPORC [Electronic Parts and Technical Ceramics Manufacturing Enterprise]. We can learn for how many purposes the various types of piezoceramics can be used. We also want to aid users with the data sheets published in our NEW PRODUCTS column.

Vecsei and Fodor describe the results of ferrite development taking place at the HAGY. In the area of traditional parts also, for example in the area of transformers, a struggle is being waged to reduce size and improve quality. The authors provide a graphic summary of the properties of ferrite materials and of the difficulties and achievements of development.

We did not receive an article from KONTAKTA (or rather, the material received was a simple product description), but we hope that even so there is development there.

Control Technology

This column appears for the first time. We would like to show the use of microelectronics in modern control technology systems. The PLC equipment is replacing earlier control devices and microcomputer control is spreading. We are hoping for observations, recommendations and--not least of all--articles from our readers dealing with this theme.

Systems

Our SYSTEMS column contains a summary of cable television systems which should be of general interest. We read Sandor Stefler's article about the wonderful services of CTV systems already operating in developed states a little bitterly, but we trust that a similar system will exist in our country shortly.

Professional Policy

The article by Tibor Somlai took this column. The question he raises is not a new one: Is use of user integrated circuits profitable? Even today the answer is not an unambiguous yes or no. The author surveys the capitalist market and compares the conditions there with those at home. He does not say as openly as we that the basic difference in parts supply is that in the West there is one and here there is not. User integrated circuits could contribute to a solution of this problem.

Advertisements, Product Descriptions

Advertisements not only add color to our journal but also provide important information in a graphic form. Our product descriptions frequently supplement difficult to obtain catalog pages and prospectuses. We will publish data sheets providing technical data in our NEW PRODUCTS column for 5,000 forints per A/4 page (in black and white).

BIPOLAR IC PLANT OF MICROELECTRONICS ENTERPRISE

Budapest MAGYAR ELEKTRONIKA in Hungarian No 4, 1985, 4 page insert

[Article by Bela Laczko: "Factory of the Future--The New MOS-Bipolar IC Element Factory of the MEV"]

[Text] We will lead our readers into a closed world. Its closed nature is not indicated by bars and jingling keyrings; this plant is a work area hermetically sealed from the outside world, a so-called high purity work area. The manufacture of integrated circuits cannot be imagined otherwise. Just think what would happen if a speck of dust or sand 60-80 microns in diameter should settle on a silicon chip if figures 5-10 microns in size had to be formed there. The question is only poetic. The new plant of the MEV [Microelectronics Enterprise] must have at least "10,000 purity"; this means 10,000 specks of dust of no more than 0.5 microns diameter per cubic foot (a cubic foot is about 0.03 cubic meters). The internal work areas have a purity of 1,000 or even 100. This is why it is not easy for us to get into the completely sealed building. First we must undress and then put on special cowled work suits. Then comes the air shower. Even so we disturb the purity.

Inside the view is fascinating, like something from science fiction, people in protective clothing slipping along behind glass walls. In order to understand what we are seeing we must understand the basics of IC manufacture.

The first figure shows a cross section of an MOS integrated circuit transistor. On the p type wafers they first grow a "thick" (500-600 nm) oxide, then they put windows in it (remove the oxide) at the site of the transistors. Another oxide growth follows, but this is thin (about 100 nm) and must be especially pure or the transistor will not work. A polysilicon layer is deposited on the thin oxide with CVD technology (chemical vapor phase layer deposit). With the aid of the photoresist technology, by etching, one must form the control electrode (gate) out of the polysilicon layer and the thin oxide (the figures are formed out of light sensitive lacquer with the aid of the so-called mask), forming the polysilicon conductive network at the same time. Diffusion follows after cleaning the wafer. The n type source electrodes and drain electrodes are made with phosphorus diffusion; thus the polysilicon layer will also be n type and its resistance will decrease. The entire surface of the wafer is protected by phosphor glass, then at those places where they want to create a contact to the metal conductive network they open windows in the glass layer. An aluminum layer is deposited with vacuum vaporization and then the metal conductive network of the IC is formed with another photoresist operation. A new glass layer now protects the finished circuit and the glass layer is removed only from the sites for wiring. This is element manufacture. (The other operations--which we call mounting--are not done in this plant.)

This is the simplest NMOS technology. In practice they use ion implantation--to set threshold voltage and prevent surface channel generation. Another operation used many times, the chemical cleaning, must be mentioned. This is done so that the silicon wafer should be clean--nearly perfectly clean--before the operations mentioned thus far.

Among the steps of the MOS technology we must stress two--the photoresist technology and the thin oxide growth. The significance of the latter is given by the fact that the MOS transistor will work only in the event of a suitable oxide layer. The photoresist technology is the other critical operation; with this one can "sketch" the proper areas, and the size of these is certainly not large. It is no accident that this technology is characterized by the smallest permitted size prescribed in the design rules. The present 5 micron technology of the MEV represents a medium level.

At first approach the bipolar technology seems somewhat more complicated than the MOS technology. Let us study the process of production with the aid of the cross section seen in the second figure. In the drawing one can see a p-n junction isolation bipolar IC transistor. The base wafer is the p type. After oxide growth and opening windows the buried layer is prepared with arsenic diffusion. This strongly doped n+ layer reduces the collector series resistance. An n type monocrystal silicon layer is grown on the specially cleaned wafer; we call this the epitaxial layer; this will be the collector of the transistor. With the aid of more oxide growth and opening of windows it is possible, in the course of boron diffusion, to create insulated collectors within a circuit. After etching the thick, strongly boric oxide they grow a 500-600 nm base oxide in which they form the sites for the bases of the transistors and the resistors of the circuit. The p type layers are also made with boron diffusion. In the course of base diffusion another oxide layer is grown, now to prevent phosphorus diffusion. Where there will be emitter and collector contacts, naturally, they must remove the oxide layer. (The collector contact provides the ohmic contact to the high specific resistance collector layer.) After phosphorus diffusion also an oxide layer is grown; windows must be opened in this at the sites of the contacts; and so the elements of the circuit, so far separate, can be "integrated" with the aid of the metal network. The bipolar circuits are also provided with a phosphor glass protective layer as we saw for the MOS devices.

The three chief operations of the bipolar technology are oxide growth, window opening and diffusion. The epitaxial layer growth not used in the MOS technology adds to this. There are also bipolar circuits where ion implantation is used; for example, resistors with high values are made with this.

Let us look at how the chief operations are done in the element manufacturing plant of the MEV. In our first picture we see wafer cleaning. The wafers with a diameter of 75 mm loaded in teflon baskets are immersed in various chemicals and then washed very thoroughly with high purity water. From here the dried, clean wafers go to oxide growth. An oxide layer can be formed on the surface of the silicon wafers simply; the silicon is transformed into silicon dioxide in the presence of oxygen at a high temperature (1,000-1,200 degrees Celsius) or in the presence of wet oxygen (oxygen loaded with water vapor). The pure, dry oxygen growth is used only to produce the gate oxide for MOS devices; thicker layers are made with the wet process. The Soviet made diffusion heaters are suitable for both oxide growth and diffusion (second picture). The diffusion temperature is also around 1,000 degrees Celsius depending on the quality of the diffusion material and the depth of the diffusion.

Ion implantation is the youngest operation of semiconductor technology in age. The doping material is shot into the surface of the wafer in the form of accelerated ions. Very special equipment is needed for this. It must produce the necessary ions, separate them from other ions and neutral particles and then accelerate them to the desired energy with a voltage of several 10 kV. The MEV has several of these so-called implanters; these can provide the small dose implantation needed to set threshold voltages, set very precisely, and the large dose implantation as well (third picture). The epitaxial layer growth can be regarded as a special technology for the formation of doped layers. With this technology it is possible to produce on the surface of the wafers a monocrystal layer of a definite type several microns thick with a definite doping concentration. In the reactor the silicon is reduced with hydrogen from the silicon compounds at a very high temperature (above 1,100 degrees Celsius) (fourth picture). The desired doping material is also produced by the reduction of some compound. Epitaxial layer growth, polysilicon deposition and even the production of phosphor glass belong in the large family of CVD technologies (chemical vapor phase layer deposit). The latter are now produced at reduced pressure in a hot wall system--similar to the diffusion heater--or by deposition aided by plasma. The modern reactors of the MEV are microprocessor controlled; setting the temperature and the gas doping are automatic. In the fifth picture one can see such an LPCVD (reduced pressure) reactor.

It is worth while to deal separately with the operations of the photoresist technology. Here we are received by even greater purity and by yellow lighting; we do not see much even of the faces of the workers. The Soviet made equipment makes possible the performance of these operations requiring special precision. In the course of our outline of the technologies we saw that the photoresist operation must be used many times. In most cases appropriate designs must be formed to work the oxide layer, but the network can also be etched out of the polysilicon or metal layer with photoresist lacquer protection. During ion implantation also a photoresist lacquer protects those areas where the ions need not be implanted. First the wafers must be cleaned (seventh picture), then they are coated with the aid of a centrifuge. The design on the mask is copied onto the dried lacquer with ultraviolet light. This requires high precision equipment called a mask adjuster (the precision is plus or minus 0.2 microns); with this the design on the wafer can be fitted to the design on the mask under a microscope (eighth picture). The operation requires good equipment and great practice. The developed design (the lacquer is dissolved away from the places where it is not wanted in a solvent) must be etched from the oxide or other layers--protected by the lacquer--after heat treatment. Today a plasma chemical method is most often used for etching. In the equipment (ninth picture) the reactive particles of the plasma created by an electric discharge quickly remove the given layer from places not protected by lacquer.

Finally (tenth picture) we show deposition of the metal layer. The conductive networks of integrated circuits are--generally--made of aluminum. The aluminum is vaporized in a vacuum by electron ray heating (or other method) and precipitates on the relatively cold wafers.

This is the end of our tour. We hope that we succeeded in giving some sense of what characterizes this special world and that the manufacture of integrated circuits has become more understandable. We know that very soon this beautiful new manufacturing line will be a significant factor in domestic parts production. At the same time we must see that there is no halt in development here; the battle is being waged in microns. With further development the present manufacturing line can be made suitable for 3.5 micron technologies. It is the goal of the MEV to reach the 2 micron level by 1990. We trust that they will achieve their goals, thus aiding the further development of the entire electronics industry.

HEAD OF COMMUNICATIONS ENGINEERING COOPERATIVE INTERVIEWED

Budapest MAGYAR ELEKTRONIKA in Hungarian No 4, 1985 pp 4-6

[Interview with Lajos Koveskuti, president of the Communications Engineering Cooperative, by Bela Laczko]

[Text] [Question] The Communications Engineering Cooperative and you personally have earned a number of distinctions recently--you became a CEMA level outstanding cooperative and comrade Koveskuti won the Eotvos Prize and was elected to the Central Committee of the MSZMP. First of all we congratulate you for your beautiful successes. We would like it if our readers could get a brief historical review as an introduction, about the development leading from the beginning to today.

[Answer] I thank you for your praise of our successes and for your interest in our cooperative. Our achievements commend the work of that collective which has been working here with enthusiasm and in an innovative way for 34 years--since we were founded. Beginning at the end of the 1950's, with the beginning of domestic television, we have been dealing expressly with TV technology, I might say that we have become the "background industry" for television. But what might be called our profile over these few decades is a good bit broader than this.

We started in a good direction, with a few engineer and technician colleagues, when we began to develop a television signal generator. Since the beginning of the 1960's we have also been manufacturing industrial cameras and monitors. More and more outstanding experts joined us.

The president and leadership of the cooperative at that time accepted and supported the plans of the young technicians and an atmosphere developed which made innovative work possible--to use the contemporary word. Inventions and then patents stamped their high level developmental activity, which would have been worth little if there had not been manufacture with outstanding technological preparation and well functioning marketing.

Of course in the heroic age it was not yet possible to separate these activities; often the same engineer developed at night what he organized manufacture of the next day, and then he would get on a planc the third day to talk about technical-scientific cooperation in some distant ministry, which also meant a sure market.

By the end of the 1960's we already had manufacture of service instruments as a specialized institution of CEMA and our annual production approached 200 million forints. In the middle 1970's we created a large piece of equipment, with Soviet developmental financing, which meant a qualitative leap; with its manufacture we reached the studio level.

In these years we decided to combine our scattered units working in Budapest and began construction of a complex at our South Buda site to offer large scale operating conditions. Our own main department for planning, construction and investment and our own construction brigade guided and organized the work and goaded the outside enterprises. Eight buildings were finished one after another, with a total base area of 22,000 square meters, and so we could combine all our Budapest activities. This brings us to today, the number 8 technological building recently began regular operations.

Our plant in Boglarlelle was an important help to our Budapest unit; it has been modernized continually since 1970 and takes care of indispensable manufacturing tasks. As an expansion of it a smaller manufacturing unit has been operating in Fonyod for a year.

Our total personnel approaches 1,500 people. Our production approaches 1.3 billion forints. We have not been among the little ones for a long time; we would like to be one of the big ones, but "only" in the quality of our products.

[Question] What does the cooperative produce, for what markets, with what productivity and with what expenditures? It would be good to know if the HT [Communications Engineering Cooperative] was outstanding among our electronic enterprises in these areas. And another very difficult question for this group: How did the cooperative achieve these results?

[Answer] Our products move over the scale from TV service instruments to TV image processing systems, including laboratory instruments and manufacturing technology and studio equipment; our closed-circuit TV systems cover all the areas covered by the word from educational applications to security alarm systems. Our computer technology equipment is also known in school and metrological applications. This is an activity sphere with many branches but one which is closely interdependent; it is based on small and medium manufacturing series and on custom manufacture with well organized work and a large investment of intellectual capital.

We have no marketing difficulties. In 1984, with net sales receipts of 1.295 billion forints, 75 percent came from export and 25 percent came from domestic sales. Our planned sales receipts for 1985 are higher by more than 100 million forints, 1.4 billion forints. Of this 1.0 billion will go to socialist export (including 0.8 billion forints' worth of CEMA specialized products, fixed in an interstate agreement) and we have 55 million forints' worth of orders from developed capitalist countries. Developed countries such as the U.S., the FRG and France are interested in three of our product families--the instrument family, industrial TV cameras and most recently in a few units of the cable television systems. We see good possibilities in the export of units for CTV systems; we have already developed several units (for example, half-sideband and two-sideband CF modulators) on order for a capitalist partner (with a 3 month deadline!) and already have orders for them worth 2 million DEM. Our special TV cameras also are competitive on the international market; for example, we can deliver them to the U.S. and get the desired profit.

In regard to productivity it might be best if we characterize our achievements with the category of "added value" (GDP). In 1984 this was more than 555 million forints, 15 percent more than in the preceding year. I can characterize expenditures with "added value per wages" as an easily interpreted datum; this was 4.5 forints per forint. (The average for communications engineering enterprises was 3.16 forints in 1984. --the editors.)

I feel that our achievements are not accidental. The secret is primarily in finding and keeping good experts and creating an atmosphere which helps their work. I am convinced that most "decent" people try to be good or even outstanding experts in a given field. In many cases they themselves do not know what it is. It is the task of leadership to put them where their abilities can unfold. Experts love what is new, often this is enough, if we do not hold them back in realizing it. They receive encouragement here. We try to honor our creative experts, not only morally but materially as well. It is difficult to change the bad domestic practice but we can do it. We are gradually but constantly expanding the gap between the pay of technical-economic experts and the other workers. When the wage development at the cooperative was 6 percent we gave the technicians 9-10 percent. Those working in manufacture understood; if they are to have work and earn well there is a need for the creative, developmental, organizing activity of the engineers and economic experts.

[Question] We understand that the cooperative leads in the application of microelectronic development, was among the first in microprocessor technique and is unambiguously first in use of user design (otherwise known as equipment oriented) integrated circuits; indeed, the cooperative itself established a microelectronics plant to process CMOS ULA base wafers. We would like to hear something concrete about the applications and we would be interested in what the interdependence is between use of the user IC's and establishment of the microelectronics plant.

[Answer] The Communications Engineering Cooperative always led in technical development; perhaps we need mention only that we were the first users in Hungary of the TTL circuits, the CMOS logic circuits and microprocessors and a few years ago we were the first in Hungarian industry to use equipment oriented circuits based on semiconductors. Since then six uniquely designed (full custom) circuits have been prepared and others are under development. These LSI-VLSI CMOS technology circuits make possible the extraordinarily modern developmental level of our products. The cooperative played a significant role in CEMA specialization; we are the patrons of service instruments. The dimensions of our microelectronic service instruments are decreasing, their energy consumption is being minimized and the level of their technical services is rising. There are frequently circuit subassemblies in the instruments the integration of which requires semicustom circuit solutions on the basis of technical and economic considerations.

Traveling the developmental path briefly outlined so far we came to a decision on the basis of which a plant was established in the HT to design gate arrays, manufacture, assemble, encapsulate and test chips, partly to satisfy our own needs and partly to satisfy such needs of domestic users. In the plant we now deal with the processing of two gate array families; one has a 3-500 gate complexity with the relatively slower metal gate CMOS technology; the other is a silicon gate CMOS family with a complexity of 500, 1,000 and 1,500 gates. Using the above basic types our engineers have started design of nearly 30 circuits thus far; half of these have been successfully completed, that is, the functioning of the planned circuit has been verified on electric models; indeed, series manufacture of several types has begun already.

Our design capacity is very narrow at present; it must be expanded. We have our own design system and a nucleus for the design staff has developed. On the one hand we would like to expand this design staff by hiring young people and by retraining design engineers working in other areas; on the other hand we will cooperate with other institutions. Among these we have developed the closest link with the Microelectronics Research Institute of the KFKI [Central Physics Research Institute]; the Microelectronics Parts Association (MEAT) founded with them is already functional. The 20 years of experience in microelectronics technology and design of the people at the KFKI helped a lot in getting our microelectronics activity started. In addition we have good links with the MEV [Microelectronics Enterprise] and we see a possibility for design and marketing cooperation with the new enterprise Mikromodul.

Manufacture will begin shortly in our microelectronics plant and I hope that by the time this interview appears experimental manufacture will be taking place in the plant. Our technologists are prepared and I trust that they will be able to overcome the very many problems which come up when putting such a complex technological line into operation. To a significant degree this plant will manufacture circuits for our own use, but we are accepting outside commissions also. There are already interested Hungarian enterprises which have ordered circuits. Some of these are already ready at the design level and manufacture can begin when the plant starts up.

Our initial experiences in the area of gate arrays are favorable and we feel that thinking in terms of microelectronic development and designing and manufacturing microelectronic circuits in-house represents a revolutionary step, not only in the quality and reliability of the products of the HT--and not least of all in the cost-effectiveness of these products--but also it can represent all these advantages in the domestic user industry.

[Question] We understand that the cooperative has started on really big investments, is setting up for self-sufficiency in a number of areas--printed circuit manufacture, surface treatment, microelectronics, for example. What is the reason for this, or we might ask, what prospects justify development on such a scale?

[Answer] Our investments in the development of technology will be determining from the viewpoint of our future. In the interest of our competitiveness we must establish all those supplementary activities which represent our own "background industry." This is how we acted in earlier years too, but the difference now is an essential one--with an accelerating tempo we succeeded in realizing certain background industry areas as the first in the country, in a way which represented a background industry for others as well. Such investments were the above described microelectronics plant and the planned surface mounting technologies plant. Let us note that we enjoy the support of the OMFB [National Technical Development Committee] because with all this we are working to advance the entire communications engineering industry.

I would like to describe our ideas with a few sentences. The reason we are to a large extent developing our own "background industry" is basically the need to modernize manufacture. The view that one needs not only quality design but also manufacturing at a high technological level in order to produce modern products is not yet entirely a general one in Hungary. Perhaps we should start with surface preparation! We had very many problems from the fact that we did not have a surface preparation plant, so the "external form" of our products frequently left something to be desired. The surface treatment plant established--at the European level--makes it possible for our products to look no worse than the product of any Western European firm. Similarly we want to go further in the manufacture of printed circuits. Investment on a fine line printed circuit manufacturing line has begun; this will not only make possible production of chips of the desired quality but also--later--will create the possibility of our converting to the surface mounting technology. These investments and the microelectronics plant guarantee that our products will be at the world level not only up to the time of designing a device but also after it is finished. This gives the real prospects, not a quantitative increase in production.

[Question] The readers of MAGYAR ELEKTRONIKA are accustomed to learning something about the personal aspects of people figuring in the journal. We usually begin, Do you have a family, hobbies? Would the comrade president say something about that?

[Answer] You are asking me to talk about myself. Let me say frankly that I do not like to do so. If I absolutely must say something then let me say only that two factors determine my life--my work and family. I was young when I came to the cooperative and began my career as a developmental engineer. Proceeding upward in various assignments, effective professional work was forced increasingly into the background, I simply did not have time for developmental work. It was difficult to accept this, but despite this I have feelings of success. The family always was and still is the other determining factor in my life. A man needs an understanding, helpful family background to be able to do burdensome work of long duration. I have such a background. My wife is a wonderful woman. She has done very much so that I live and work in a good atmosphere. I have three grandchildren whom I love very much. The love of grandchildren is something different than that of children. They give me very much joy and I am happy.

[Question] Thank you very much for the interview. I wish the cooperative further success and I wish you good work and the strength and health for it.

PIEZOELECTRIC CERAMICS

Budapest MAGYAR ELEKTRONIKA in Hungarian No 4, 1985 pp 28-31

[Article by Lajos Kamori: "Piezoelectric Ceramics and Their Product Assortment at the KOPORC"]

[Excerpts] The applications for piezoelectric ceramics are already quite varied--filters, vibrators and sound generating devices are made of them. With miniaturization it has become important to develop sound generating and indicating devices of very small size. The present article summarizes the results achieved at the KOPORC [Electronic Parts and Technical Ceramics Manufacturing Enterprise].

The Piezoceramic Products of the KOPORC

In accordance with the needs the KOPORC manufactures disk and flat converters of various sizes. The maximum size of the disks is 35 mm with a thickness of 10 mm. The maximum length and width of the flat converters is 15 mm with a thickness of 2 mm. We intend to increase the dimensions in the near future.

In general we use our material designated Piezolit 5 to manufacture these products. Its characteristics are:

density: 7.6 g/cubic cm,
plane coupling factor: 0.55,
frequency constant: 2100 Hzm,
mechanical quality factor: 70,
piezoelectric constant: d_{33} min. $300*10^{-12}$ C/N, g_{33} $31*10^{-3}$ Vm/N,
Curie temperature: 350 degrees Celsius.

At present the KOPORC manufactures three types of buzzers. The PKZ 42-9 is a broad band type without electronics. It can be used advantageously to indicate sound frequency voltages. The PKZ 21-13 is a narrow band type with electronics. It operates on direct current. It gives acceptable sound pressure with a small size and little current use.

The PKZ 36-21 type is also electronic, a narrow band buzzer operating on direct current. It gives relatively high sound pressure and so can be used in a noisier environment.

Csaba Gyarmati has written in more detail about KOPORC buzzers (HIRADASTECHNIKA, 35, 42, 1984).

The manufacture of additional acoustical products is being prepared. Our page in the NEW PRODUCTS column gives detailed technical data on the acoustical products of the KOPORC.

Among our filters the CF 455-A is actually a resonator; using an emitter bridge instead of a condenser significantly improves selectivity.

The CF 455-B and CF 455-C are band filters for the AM MF stages of radios.

The CF 5.5 and CF 6.5 C filters are made for the audio MF stage of television sets.

The CF 10.7 C filters can be used in the FM MF stages of radios.

Lajos Kamory

I was born in Budapest in 1942. I graduated from the Veszprem Chemical Industry University in 1966. I then worked in the Semiconductor Development Department of United Incandescent where I dealt primarily with a study of semiconductor surfaces. I wrote my doctor's thesis from this material. Since 1973 I have worked at my present job in the KOPORC. I deal with the development of piezoceramic materials and parts and the technology for their manufacture. I am married and have three children. I spend my free time primarily with my family. I like to read and sometimes play bridge with my friends.

PROGRAMMABLE CONTROL EQUIPMENT

Budapest MAGYAR ELEKTRONIKA in Hungarian No 4, 1985 pp 38-44

[Article by Peter Zalotay: "Programmable Control Equipment (Type TPV-1) And Its Applications"]

[Excerpts] We have been dealing with modern programmable control equipment at the Heavy Current Automatics and Equipment Institute of the Kalman Kando Electric Industry Technical College since 1976. The theme plays a significant role in both instruction and research and development activity. I describe below the TPV-1 type programmable control equipment developed at the institute--on an industrial order.

Applications Possibilities

The stored program control equipment was developed with the primary goal of replacing the traditional relay controls.

The selection of output units makes possible the direct control of small and medium capacity switching devices (relays, magnetic switches) and other electromechanical intervention organs (valves). The input interface unit transforms the state of the primary switching elements into a voltage logic signal, but it is also suitable for accepting two-state voltage or current signals.

The potential isolation of the input and output signals makes the control equipment suitable for use in a "noisy" industrial environment.

The broad applicability of the TPV-1 type control equipment is made possible by the fact that in addition to combinatory control tasks the software level solution of delay, counting and comparison makes it suitable for sequential control as well. Implementing the latter does not require special hardware units in addition to the units already described.

The storage capacity of the user program is 4 K bytes. Considering that the majority of the instructions take 2 bytes it is possible to realize with this equipment tasks which can be described with a program of about 2.5-3 K bytes length--depending on the character of the task. The program capacity and the maximum of 256 input channels and 256 output channels ensure the broad applicability of the equipment.

The units of the control equipment are made in the 2x Europa card size. The equipment can be assembled unit by unit in a rack or in a cased version. In photographs 1 and 2 one can see the cased version which was exhibited at the 1983 Budapest International Fair. At the exhibit the equipment was demonstrated with a program to protect against surges at a power distribution substation.

Peter Zalotay

I am a graduate electrical engineer and college lecturer. I was born in Szentes in 1938. I earned my diploma in 1963 in the communications industry section of the Electrical Engineering School of the Budapest Technical University. I began my professional work in the Fluorescent Lamp Factory Unit of United Incandescent. After that, for 5 years, I was engineer-teacher at the J. Landler Machine and Communications Industry Technical School. I have been working at the Kalman Kando Electric Industry Technical College since 1969, presently in the Heavy Current Automatics and Equipment Institute of the college. I do teaching and research in the area of hardware and programmable electronic controls. I have been dealing with development and use of programmable logic controls (PLC's) since 1976.

CONSUMER IC'S, DOMESTIC PROBLEMS

Budapest MAGYAR ELEKTRONIKA in Hungarian No 4, 1985 pp 60-68

[Article by Tibor Somlai: "Concerning the Capitalist Market for User Integrated Circuits--In the Mirror of Domestic Problems"]

[Excerpts] One of the central elements of the Electronics Central Development Program adopted in 1981 is domestic manufacture and use of equipment oriented and user oriented integrated circuits. In the time since 1981 several important phases of the investment have been concluded and products intended for commercial trade are already being made on one of the new manufacturing lines. Trade in user circuits is slowly beginning, but today we meet with a number of technical and other difficulties and the take-off is not so vigorous as we might have hoped.

Among the phenomena of the capitalist market for user circuits I will deal in the article primarily with those which can be related to the problems experienced on the domestic market. In addition, on the basis of an analysis of the capitalist markets, I would like to provide the reader with information of primarily an economic character which--we feel--has thus far received little room in the domestic professional literature.

Lessons, Critical Points From the Viewpoint of Domestic Manufacture, Use

1. An analysis of the international market for user IC's proves that in the case of this product group a following semiconductor wafer technology level is sufficient, and that only this can give hope to smaller firms or those newly entering the microelectronics branch. At the same time it must be emphasized that:

--Even a following semiconductor wafer technology must reach a minimal--and constantly rising--technical level if marketable user circuits are to be made with its aid. (Today this level is primarily the CMOS technology, in general with a geometry between 3 and 5 microns.)

--The phases outside of the wafer technology must represent the highest level, and within this the quality of the design and testing processes should receive special emphasis. A study of the capital intensity of these work processes shows that very significant assets must be expended here to make use of the intellectual work.

2. The priority of innovations linked to production processes (to technology) as opposed to product-centered innovation is characteristic of the semiconductor industry as a whole. In the design and manufacture of user circuits also special consideration must be given to technological discipline and the high level requirements made of work organization; at the same time we know that in our country the level of such activities is not too high in general. It can represent a similar or even greater problem that manufacture of and trade in user integrated circuits, because of their service character, require very intensive manufacturer-user contacts, a perfect material supply system and very well "oiled" contract contacts where the commercial and information lines necessarily cross national borders in the case of a smaller country. Trade in this product group requires a high level of services, a level which even the market mechanisms of the most developed capitalist countries could not provide for a long time. All this is a warning that really successful domestic production of user integrated circuits requires special efforts on the part of the manufacturer and changes in the general economic environment going far beyond the problems of this product group.

3. Studying the cases of developed Western European applications and the actual trade figures it appears that even there use does not always go easily; even when developed products and services are offered this new concept is slow to fit into the technical and production culture of the user enterprises. Integration to silicon requires from the user an assumption of risk and the tying down of relatively significant resources and only hard market impulses will force the spread of applications going beyond the level of technical experiments. We believe that the domestic electronics industry not only needs such environmental effects from the viewpoint of user IC applications but also that if there is to be a wider spread of the domestic user IC culture then a technical, structural and economic renewal of the equipment manufacturing industry is indispensable. In other words, only a modern industry will demand and be able to effectively use modern products.

4. In addition to recognizing the basically successful technical conception it must also be seen that manufacture and use of user integrated circuits will take place in a constant competition struggle with other product groups--in the complex environment of constantly changing semiconductor industry technologies. So it is possible that even in the future it may be more efficient and cheaper to satisfy user needs representing a following level by means of software adaptation of purchased catalog circuits--instead of a hardware solution. All this could add to the dilemma of choice among expectations, risks and commitments. Even knowing the present products the choice must be weighed especially carefully when the series sizes are very small, and thus the developmental costs for a user circuit are high.

5. In the course of an analysis of the user integrated circuit market of developed capitalist countries, however, the chief experience to be gained is still that in the near future these products will form one of the chief trends in integrated circuit technology and the market for them will constitute an ever increasing segment of the market for integrated circuits. At the beginning of the 1980's an effort to get into the microelectronics market appears at the government policy level as a principle of industrial development in every developed capitalist country with an electronics industry and in general, as the first phase of this, the goal designated has been design and manufacture of user integrated circuits--primarily because of their strategic importance.

Adopting the design and manufacture of user circuits is also important from two viewpoints. On the one hand it is essential for the larger firms or for national security strategy that the parts development most closely linked to product and system development be "in-house". On the other hand it is more advantageous, in regard to the development of general user culture, if the microelectronics manufacturing base is in the country. In addition, joining in the design activity can have a positive effect on related areas of developed technology--graphics, CAD, software and manufacture of testing equipment.

In the interest of the domestic realization of these advantages and of overcoming the obstacles it is certain that there is a need for hard and consistent work on the part of both manufacturers and users, and it is no less important that the economic regulators and the technical development possibilities should develop in such a way that the domestic electronics industry as a whole can turn in the direction of the world market trends.

SCIENCE AND TECHNOLOGY ROMANIA

NEW TECHNOLOGIES IN PRODUCTION OF METALS DISCUSSED

Bucharest METALURGIA in Romanian No 9, Sep 85 pp 459-461

[Article by Iancu Dragan, director general of the Central Institute for Metallurgical Research]

[Text] The Institute for Metallurgical Research (ICEM), established in 1950 as a departmental institute specializing in metallurgy, has developed its activities consistent with the orientation and structure of metallurgical progress, seeking to meet the needs created by the metallurgical industry. The institute has developed steadily throughout its existence, being allocated large investments for production and research equipment, machinery, and instrumentation.

This development has been particularly felt during the past 20 years, years during which the secretary general of the party, Nicolae Ceausescu, has devoted constant attention to the growing role of science and technology in the country's economic and social life, and to improved and modernized education, closely related with scientific research and the production of goods.

The continuous consolidation of ICEM's collective as a strong force for introducing technical progress in the metallurgical branch, and for encouraging the creativity of metallurgical engineers, technicians, and workers, has meant that during the 1976-1980 five-year plan, more than 89 percent of the planned investments were completed with domestic designs, a figure which has increased to more than 95 percent during the current five-year plan.

Some of the new metallurgical objectives which have been based on domestic designs and placed in operation, are: the stainless and refractory steel plate section at the Galati Steel Combine (CS); the steel alloy rolling mill for semifinished products at the Tirgoviste Steel Alloy Plant; the rolling mill for small and intermediate cross sections of steel alloys and special steels at the Tirgoviste Steel Alloy Plant; the deep drilling tubular products section at the Republica Tubing Enterprise; and the deep drilling tubular products section at the Roman Tubing Enterprise.

The introduction in production of the results obtained in research, has made it possible to fabricate new steel and non-ferrous alloy products such as: plates for boilers and pressure vessels; cold-milled sheet metal for vehicle bodies; strips for longitudinal- and helicoidal-welded pipe; hot and cold rust-resistant sheets; pipes for the power generation industry and for boilers; stainless steel pipe for the chemical industry; tubular products for very deep drilling; iron alloys (Fe-Si, Fe-Mn, Si-Mn); tool-steel milled products; resistive-alloy wires; extruded aluminum-alloy products for the aircraft industry; aluminum-alloy sheets for the naval industry; and so on.

Today, ICEM has a production base which during 1983 and the first eight months of 1984, produced more than 8000 t of materials with superior characteristics for the advanced industries. For special ongoing programs, it has provided forged blocks and bars of extra pure steels and alloys, flat and tubular products, as well as calibrated wires from among the 14 new types of steels for electrodes and welding rods in the SAOZ program, and the 15 new types of steels for electrodes in the CNE program, in collaboration with the Cimpia Turzii Metallurgical Combine, the Bucharest Heavy Machinery Enterprise, Grivita Rosie, and other users. The institute has started to manufacture a number of special extruded shapes such as high speed elevator slides, hinges for OLTCIT, special alloy tubing for diesel plugs in collaboration with the Republica Transportation Enterprise, finned tubing for the power generation industry, and so on. In addition, it produced a wide range of technical ceramic products to reduce importation, as well as composite special production sandwich materials.

In the fabrication of electrodes for the steel industry, scientific research at the institute and specialized groups at the Central Institute for Chemistry have implemented new manufacturing technologies to reduce specific and power consumption in the production of electrodes, and to improve their overall quality. The industrial results obtained have confirmed that the approach is correct: the electrodes thus obtained are of much better quality and reduce specific consumption in steel plants. It is necessary to continue to maintain the constancy of this technology in the future by assuring manufacturing compositions, an area in which the participation of specialists from the Ministry for the Chemical Industry is a determining factor. The continued supply of acicular coal from domestic production, together with strict compliance with technologic specifications, will form efficient and secure links for a qualitative leap in production at the Slatina IPC.

In steel production, while developing production capabilities in oxygen converters and reducing the proportion of Martin steel, there has also been a great concern for achieving high technical and economic indicators in all phases of technical processes. Work is thus underway to increase the ratio of scrap iron in converter loads, with specific technologies and installations being used on an industrial scale at present on the basis of these projects. Along with the conventional techniques of preheating scrap iron, of post-combustion inside the converter, or of "electrically" superheating the iron load, interest is being shown--particularly for the new perspectives it can open--in coal insuflation. A tight program in collaboration with the Galati CS and IPROMET has been formulated for this purpose.

Also notable is that during the past period, the cumulative effort of research, production, and design specialists has led to the industrialization of modern processes for formulating low-carbon stainless steel with oxygen-argon insuflation at the Galati CS, or with vacuum techniques at the Hunedoara CS. The results obtained, in terms of metallurgical process stability, production quality, and technical economic indicators, testify to the efficiency of these technologies.

In steel production diversification, exceptional results have been obtained on existing manufacturing lines for flat and shaped weldable steel products with high strength and toughness characteristics, thermally processed steels, heat resistant alloy steels, as well as stainless and refractory steels. Also produced were blocks and milled products from alloyed and highly alloyed tool steels, a wide range of products from high-strength chromium and aluminum alloy steels, as well as from nickel alloys of the Invar and Permalloy type. These projects were made possible by the support of specialists from the Galati CS, Hunedoara CS, Resita CS, COST (Tirgoviste Special Steel Combine), CMCT, Otelul Rosu Enterprise, and other Romanian units with a tradition of steel production.

Good results were similarly obtained in collaboration with COST in producing steels for high strength bolts and valves.

Special metallurgical problems are raised by the fabrication of electrical steel strips, and particularly transformer steels. Promising results were obtained together with specialists from the Galati CS and COST, which indicate that the adopted techniques are correct; it remains necessary to hasten the completion rate of established programs and measures.

As part of programs designed to assure domestic materials for the construction of power plants, as well as for aviation, electric machinery, and electronics, researchers together with specialists in metallurgical combines and plants have to solve a large number of technical problems, which require constant collaboration between producers and users. The pursuit of these programs, coordinated by the national Council for Science and Technology (CNST), will provide the optimum framework for completing the proposed objectives.

A special role will continue to be played by improvements in the production structure. Given the good results obtained through standardization, thus reducing by 50 percent the number of types, models, and dimensions of existing steel products, further action will have to be taken to reduce the consumption of steels alloyed with materials that are in short supply.

Economies of energy and fuel have been based on a program to recover usable energy resources, which was begun with analyses at each steel production site aimed at optimizing the distribution of fuel and power.

One of these actions has been to collect and make best use of the secondary combustible gases resulting from the production of cast iron in furnaces and from coal coking.

For better fuel utilization, installations have been designed to introduce furnace and coke gases during agglomeration, steel making, and milling, so as to free various amounts of methane gas or to increase the energy integration of steel enterprises.

Combustible gases and their heat were recovered and used for technical purposes by burning them in special boilers to produce steam and electric power.

These activities will have to be furthered and diversified to fulfill the priority task assigned by the party and state leadership to the metallurgical industry, which is to assure Romania's energy independence by the end of this decade.

In the area of refractory products, technologies were finalized to produce exothermal feeders for radial forging machines; to obtain dolomite and magnesium-dolomite materials for converters; magnesium spinel for making induction furnaces; special spinel products designed to be used in equipment for vacuum outgassing steels; and so on.

Research must continue to help extend the basis of raw materials for metallurgy and associated industries, thus increasing the value both of Romanian and imported raw materials. The rapid and effective implementation of research results in industry, together with the collectives in combines and metallurgical plants, will seek to raise the technical and quality level of products, reduce consumptions--especially of power and materials, and expand the utilization of reusable resources.

In microproduction, steps will have to be taken to increase production capabilities for extrapure steels for aviation, nuclear power plants, resistive alloys, and so on, and to provide the economy with products that are needed in small quantities.

The CS-DT-IPT plan objectives for the 1986-1990 period are derived from the Directives of the 13th Party Congress, from the most recent party documents and orientations given by Nicolae Ceausescu, secretary general of the party, as well as from the indications provided by academy member, doctor, engineer, Elena Ceausescu, first vice-prime minister of the government, and chairwoman of CNST.

The plan includes a number of objectives aimed at developing the basis of raw and other materials, improving the technical and quality level of products, reducing the consumption of raw materials, fuel, and power, further increasing labor productivity, achieving Romania's more efficient participation in the international division of labor, performing fundamental research to obtain the technical solutions needed for the future stages in the development of the national economy, achieving technical and scientific cooperation with other countries, and so on.

In order to develop the raw materials base, technologies are being planned to increase the production of coke, and of coals and their subproducts, to economically exploit Romanian iron and manganese deposits with a low metal content, and to increase the production of refractory materials while improving their quality.

To improve the technical and quality level of products, ICEM is fabricating converter steels with oxygen insuflation, vacuum technologies, as well as insuflation of desulfurizers and deoxidizers in liquid steel. Particular attention is also being devoted to improved extrusion and milling technologies for tubing, precision or designed shapes in steels and special alloys, wires, and strips. An impressive amount of conventional fuel is also expected to be saved throughout the nation by implementing already known technologies, thus helping to comply with national measures for reduced energy and fuel consumptions.

Several research objectives are planned for increasing labor productivity. Cast iron processing outside the furnace will be continue to be developed so as to reduce the content of phosphorus, sulfur, manganese, and silicon, with significant effects on longer lifetimes for refractory linings.

ICEM specialists are planning to apply techniques of high technologic efficiency, minimum consumption, and maximum productivity, such as expanded continuous casting, the formulation of steels by means of non-conventional processes, implementation of computer techniques in all major phases of production, and so on.

In the coming years, the metallurgical industry will place particular stress on new, highly efficient products with a large degree of processing, which will help reduce importations and expand the exportation of high performance materials and equipment. Some of the anticipated products are: new types of thick weldable construction steel plates with high pour limits; various types of tool steel or special alloy strips for the electrical and electronics industry; new kinds of steels for power generation, chemistry, drilling in corrosive environments, and high speed railway transportation; new types of boilers; bearing tubing; titanium and zirconium alloy bars and tubes; special iron alloys; new types of electrodes, chemically bound refractory products, and so on.

The program for greater technical and scientific cooperation with other countries concerns broadening the raw materials base, reducing materials and energy consumptions, long range technologies, greater possibilities for investigating new materials, automated control of steel making processes, and other problems whose solution requires cooperation with other foreign units.

The collective of the institute is determined to continue to contribute through all its activities, in the spirit of the tasks outlined by the party and state leadership and personally by Nicolae Ceausescu, to the development of all aspects of the Romanian metallurgical industry.

CZECHOSLOVAKIA

NEW GENERATION OF CZECHOSLOVAK OPPOSITION

Luxembourg LUXEMBURGER WORT in German 11 Jan 86 p 16

[Article by Wolfgang Broer, Vienna: "The Passing of the Olympic Torch in the Czechoslovak Opposition--For the First Time the Younger Generation Takes on the Obligations of the Old Opposition"]

[Text] The Czechoslovak "Charter 77" civil rights movement has shown signs of life again--as it has at the beginning of each new year--and its three new spokesmen for 1986 were nominated. They will shortly provide an accounting of the "charter" activities for 1985, as well as an outlook for the year which has just begun.

The personnel composition of the spokesman-triumvirate is once again very bright, if one considers their political background and origins. Also, a generation change is being seen for the first time. The three new spokespersons are the 61-year-old Jan Stern, the 35-year-old Martin Palous, and the 34-year-old Anna Savato Sabatowa.

The greatest surprise is likely to be the selection of Jan Stern, who was not particularly active recently in the civil rights movement and, more likely, stood somewhat aside. Stern was a journalist with the party organ RUDE PRAVO in the 1950's and defended Stalinist policies at the time. He was no committed party participant in the "Prague Spring," but "converted" at the beginning of 1969 very rapidly to the opposition and was one of the first journalists anywhere who was "purged." He was prohibited from exercising his profession and was forced to earn his living in poorly paid and unqualified jobs. He was one of the first signatories of the "Charter 77" document. In 1984, he retired and substantially withdrew from any activities of the "charter" movement. Jan Stern's first marriage was to Eva Kanturkova, who was a "charter" spokesperson in 1985.

Jan Palous represents that younger generation of the opposition in Czechoslovakia which is following in the footsteps of their parents. He is the son of Radin Palous, a former university lecturer in philosophy, who had also been a "charter" spokesperson and primarily became famous for his seminars and lectures held in private apartments. The political-ideological background of the Palous family can be designated as liberal-Catholic. Martin Palous is a doctor of natural sciences and a trained programmer. He publishes the Samisdat publication ESSAYS and is also active in the publication of INFORMATIONEN UEBER DIE CHARTA [INFORMATION ON THE CHARTER].

Also, the 34-year-old Anna Sabatowa signals a generation change and the passing of the Olympic torch in the opposition environment from the aged to the youth. Her father, Jaroslav Sabata, was once a high Communist Party official, then a prominent personage in the "Prague Spring" and, finally, a "charter" signatory and cofounder of the Committee for Protection of Unjustly Persecuted Persons (VONS). Sabatowa, mother of three children, is the wife of Petr Uhl, who established the "Revolutionary Marxists" group in 1970. In the first great political trial of the 1970's within the framework of Husak's "normalization," Uhl and 16 other defendants were sentenced for "subversive activities" in 1972. At that time, Anna Sabatowa was sentenced to 3 years, Petr Uhl to 4 years in jail.

Shaped in her political orientation by her father through the democratic left, Anna Sabatowa was primarily concerned with publishing the monthly INFORMATIONEN UEBER DIE CHARTA, which has been appearing for almost 8 years now. Her address appears in the masthead. INFORMATIONEN UEBER DIE CHARTA, which is typed and duplicated, publishes the verbatim text of the documents of the civil rights movement, but also contains letters to "charter" from abroad, perhaps from like-minded persons in other East European countries and, for example, letters from supporters of Western peace movements. The publication also runs discussion contributions pertaining to various "charter" documents, as well as hints on important new Samisdat publications.

In summary, it can be said that the appointment of Martin Palous and Anna Sabatowa signifies an important step to the extent that the continuity of the civil rights movement thus appears to be secured and its "drying up" as a result of purely biological superannuation need not be feared.

CONCERN OVER CHURCH'S INTERNAL MISSION, CONDITION

Schwerin MECKLENBURGISCHE KIRCHENZEITUNG in German Vol 41 No 5, 2 Feb 86 p 2

[Article by F.W. Rabe: "Homecoming to the Fold of a Weatherbeaten People's Church?"]

[Text] During a visit to Sweden I encountered a unit of the Salvation Army in the center of Stockholm. Uniformed and well-ordered, they sang pious songs and cheerfully distributed leaflets. "Come back to Jesus" was their invitation to the rapidly passing crowd. I felt that this missionary action was both touching and helpless. Was it the fault of the "receivers" that the message was not picked up? I rather thought that the "broadcaster" sent out a program incomprehensible to everyone. The positions were set down too rigidly. Flexibility for a dialogue did not seem part of the plan. So there were those singing, and the others rushing by; a law of nature!

Church in Decline

Whoever travels observantly through our northern regions will notice more and more village churches in poor structural condition or even given up to final decay. One sees hardly any effect of the often fruitless efforts of the pastor in charge and individual parish members to restore "their" church.

Often, all efforts to gather a community of Christians into a parish seem just as fruitless. The damaged church building becomes a reflection of the real parish situation. Whoever sees the missionary task of our church primarily one of restoring all church structures in order to regain the image of the traditionally visible people's church will--like the Salvation Army--sing songs understood by no one, and arousing hardly anyone's interest.

In my opinion, in a speech before colleagues of the "Sign of Atonement Action" in December of last year, Berlin General Superintendent Guenter Krusche rightfully asked the question if we can and want to continue as an "area-covering" church in the GDR. Evidently, it is still difficult for us to be a church in the world of real socialism. Structures and theological principles--framed by a golden past--which want to continue to form our parish image, lead or mislead us into unwanted isolation. In the last analysis, only Christians willing and capable of dialogue will be able to be effective in missionary work. And all of us have plenty of homework to do in our churches.

Church in Ascendancy

In the area of the Schwerin bishopric (it corresponds to the territory of our Land church), the Catholic Church implements more and more the restructuring of its parish work. Towns are becoming the focal point of religious life with well-equipped churches and an effective team of priests and co-workers. Although implementation is not always easy--there is a lack of priests and lacking strength of co-workers--, the opportunity for the individual to experience parish life, the capability to influence the surrounding world, are planned properly and with an eye to the future. Catholic Christians in most villages focus more and more on the parish in the nearest town. This way also promotes the willingness to engage in missionary dialogue with people who have moved to the periphery of the church and no longer belong to any church.

Even if it is hard on us, should we Evangelical Christians not also be more honest toward ourselves and others? Is an "area-covering" presence of church buildings and church colleagues, who often involuntarily have become "soloists", missionary? Does it radiate something which can sweep along others? I am afraid that it is rather the reverse and is becoming a hindrance: deterring, disappointing, incomprehensible. Especially outsiders (and they are not becoming fewer) interpret the signs of the good ship Land church in this manner.

Isolated and constricted by outdated structures, it is difficult to preach convincingly about hope and encouragement. Do we know the questions confronting us and our church, and do we take them sufficiently seriously? Do we want to approach the people or, subliminally, do we continue to expect their return to the not-so-sheltering fold of a weather-beaten people's church?

To express it with a thought of D. Bonhoeffer's (he would have turned 80 now): it is not the world that should enter the church, it is the church, rather, that must be on its way out into the world. To realize this--if we want it!--, we need partners in dialogue to whom we should listen carefully at first in order not to miss the way into the world. Old preset answers to questions by men in a society alienated from the church are worthless in this endeavor.

The Catholic theologian K. Rahner expresses it well when he says: "The church does not offer us prefabricated houses that only need to be put together and erected in order to live in them in the right manner. It does offer us strength, however, so that we wanderers find the way to God--

without prefabricated houses. It offers us strength to seek this road and to try over and over again, without fear of the future and without being discouraged by the past."

VARNAI CONTINUES, EXPANDS REASSESSMENT OF MINDSZENTY

Budapest MAGYARORSZAG in Hungarian 16 Feb 86 p 21

[Article by Ferenc Varnai: "The Mindszenty Issue, Mutual Distrust, Obstacle to Constructive Arrangement"]

[Text] Author Jeno Gergely's book "The Catholic Church in Hungary 1944-1971" (Kossuth Publishing House) alleges that in connection with the secularization of schools a segment of the episcopate was deeply distressed by the strained relations between the state and the Catholic Church. We can read that on 18 September 1948 several prelates--Archbishop Gyula Czapik of Eger among them--traveled to the immediate environs of the pope in Rome to get the Holy See to send to Hungary a visitator whose presence would set limits on Mindszenty or rather on the independence of the Hungarian hierarchy. During talks held at the Vatican, it was suggested as food for thought that the pope order Mindszenty to the Vatican as a curial cardinal. Czapik announced: "The situation is at a standstill, and compromise is impossible because neither the primate nor the episcopate is receptive to it."

Discord could be observed within the episcopate as early as the autumn of 1948. Gyula Czapik and Bishop Laszlo Banass of Veszprem publicly criticized the prince-primate and condemned his policy. They urged compromise as opposed to confrontation. "Mindful of the church's situation in the eastern section of Europe," Pope Pius XII nevertheless granted Mindszenty a portion of his sovereign rights, and thus even without Rome's previous approval the Hungarian cardinal was able to institute every ecclesiastical measure he deemed necessary.

Legal Proceedings Against the Primate

In his pastoral letter of November 1948, Mindszenty shifted all responsibility for failure to reach a compromise onto the state and promised to continue the confrontation. Deputy Prime Minister Matyas Rakosi declared on 27 November: "The policy of tolerance has come to an end...If the church does not do something about Mindszenty during the next few weeks, then we will..." The timing was probably related to the fact that the leadership of the Hungarian Workers' Party had placed the accelerated socialist transformation of agriculture on the agenda. The speedup in policy was accompanied by liquidation of the multiparty system and by restriction of democratic opportunities, but elimination of church resistance took the administrative route. On the day after Christmas 1948, the agencies of internal affairs arrested Mindszenty and several of his colleagues on suspicion of treason, espionage, trafficking in foreign currency, and organizing to overthrow the republic. On 8 February 1949, the People's Tribunal sentenced the primate to life imprisonment. Archbishop Jozsef Grosz of Kalocsa assumed the chairmanship of the episcopate assembly.

The government one-sidedly laid responsibility for the conflict at the church's door, writes the author, even though the conflict fed on mutual distrust: after all, the democratic authorities did not always exhibit proper tolerance of the church's viewpoints. Unfortunately, the reactionary force within the Catholic Church and the battle against religion intermingled more and more. The political trials conducted against the prelates indicated the emergence of a personality cult and a sectarian dogma in ecclesiastical policy at a time when the Catholic Church, led by Pius XII, had committed itself to the Cold War and an anticommunist witch-hunt and had forbidden cooperation with communists on pain of excommunication. Yet it was wrong to declare the Catholic Church the "principal enemy" and to label the battle against clerical reactionaries the principal task. In the strained atmosphere, leaders of both the state and the church made mistakes which prevented the state and the church from entering into a constructive relationship.

It can be established from published documents and affidavits that the accusations in the Mindszenty trial were basically justified. (The public prosecutor brought charges of political conspiracy to overthrow the republic and to restore the monarchy with the aid of foreign currency.)

In the overall very tense and strained domestic situation of that time, however, the danger and seriousness of the case were blown up out of proportion. The propaganda campaign in connection with the trial took aim at intimidating the extremist segment of the clergy which opposed the republic. It is a fact that Mindszenty was an enemy of the Hungarian people's democracy, and a solution was therefore impossible without his removal--a self-protective measure by provoked authorities. The lawlessness was, of course, absolutely inexcusable, as were the methods which wounded the self-esteem and religious persuasion of a significant portion of the faithful.

So talks between the state and the Catholic Church did not take place until the summer of 1950 and only after several rounds, on 30 August, did they result in the signing of an agreement.

Nor Is Imre Nagy Good

The author sums up subsequent developments. On 31 October 1956, the counterrevolutionary officers of armored troops brought Cardinal Mindszenty, who up until then had been kept under restraint, to Budapest. Mindszenty wanted to run his church and the country not from Esztergom but from the primatial palace of Budavar. First he suspended the leaders of the church peace movement from their priestly duties and ordered them to leave the capital city immediately. In a radio speech broadcast from Parliament on 3 November, he made it clear that he wanted to continue from where he had been forced to leave off on Christmas 1948. "It is not necessary for me to break off from my past. By the grace of God, I am the same person I was before my imprisonment." He pronounced the events a "national struggle for freedom" in order to stress the anti-Soviet nature of what had happened and in order to deny that they were aimed at reform of the socialist system. He warned the followers of Imre Nagy that if they persisted in describing the change as "national communist" in character, "still another piece of evidence" could crop up, i.e., the struggle to be conducted without them and against them. Indeed, he even demanded that the revisionists led by Imre Nagy be taken to task: for what had happened in the past, he labeled them "criminals," as well as those against whom they had launched the struggle. If in the meantime armed suppression of the counterrevolution does not occur, then at his urging and with his blessing the followers of Imre Nagy will be driven from power, and complete and overt restoration of the capitalist social order will begin. He made no secret of his goal to reestablish private ownership and to nullify the nationalization which had occurred since 1945. As he put it: "We intend to be a people and a country which are properly and evenhandedly restricted in social interests, which rest on private ownership, and which have an exclusively national cultural spirit."

Mindszenty's speech did not strengthen the "national unity" which he had urged. On the contrary, it contributed in large degree to elucidation of the fronts. It helped many persons undecided up until then--priests and parishioners among them--to understand the essence and actual course of events.

At daybreak on 4 November 1956, the cardinal fled from his responsibilities to the American embassy in Budapest where he was granted political asylum.

As Rejected Politician

Serious talks between the Holy See and representatives of the Hungarian government got under way in the summer of 1970. Prior to this, the Hungarian episcopate had asked the pope to rescind the 1957 decree forbidding priests from assuming their representative functions and fulfilling their political roles, to place the right to grant approval back in the hands of Hungarian bishops, and to repeal the measures taken against participants in the church peace movement. On 13 October 1971, the Vatican came to a favorable decision. However, the government announced that a request for prior approval of the Presidential Council was necessary only for filling ecclesiastical posts which depend on papal appointments, but that prior approval of the chairman of the State Office of Church Affairs was needed for filling a post which depends on the appointment by diocesan bishops and a few other ordinaries. Prior state approval for filling other ecclesiastical posts was gradually modified: mere notification is necessary for a fraction of them, but nothing is necessary for most.

At the same time, a solution was found to the Mindszenty problem. Early in May of 1971, the Holy See offered its solution: allow Cardinal Mindszenty to leave Hungary and travel to the Vatican, allow him to retain the rank of archbishop until the seat of archbishop of Esztergom is permanently filled and, finally, have the state rehabilitate him after he freely bids farewell to his parishioners. The last two conditions were unacceptable to the government. The talks got under way early in September; the Hungarian state was represented by Undersecretary of State Imre Miklos. The agreement signed on 9 September laid down the conditions for departure: the government permits the cardinal to travel to the Vatican, and the Vatican assures the government that after his departure Mindszenty will refrain from meddling in the life of the Hungarian Catholic Church in any manner and from issuing unfriendly statements about--or engaging in hostile activities against--the Hungarian People's Republic and its government. (Mindszenty did not comply with this requirement, nor did the Vatican.) The Presidential Council granted Mindszenty a pardon and discontinued the criminal proceedings instituted against him in 1962 for what he had done in 1956. The government expressed its hope that Mindszenty would retire at the age of 80 in March of 1972 and that the seat of the archbishop of Esztergom would fall vacant.

Mindszenty was in a tight corner because his person had become a nuisance to the United States. On 28 September 1971, he finally left the country. The high priest, who had not altered his earlier views during the decade and a half he spent in the American embassy, was forced to leave his homeland as a rejected politician. When he turned 80, Paul VI in a letter asked the cardinal for his resignation. Mindszenty refused. On 18 December, the pope was compelled to declare the seat of archbishop of Esztergom canonically vacant, i.e., to "retire" Mindszenty.

The final obstacle to completion of the Hungarian Catholic Church's hierarchy was removed. At the start of 1974, titular bishop Laszlo Lekai was made apostolic regent of Esztergom. Then on 10 February 1976, after the prior approval of the Presidential Council, Lekai was appointed archbishop of Esztergom by Pope Paul VI.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

AGRICULTURAL WORKERS' WAGES IN EIGHTH 5-YEAR PLAN

Prague PRACE A MZDA in Czech No 10, 1985 pp 11-17

[Article by Eng Jiri Plha, candidate for doctor of science, Central Agricultural Employee Trade Union Committee: "Compensation for Agricultural Workers in the Eighth 5-Year Plan"]

[Text] The 11th and 12th Plenary Sessions of the CPCZ Central Committee evaluated the performance of agriculture during the Seventh 5-Year Plan in some detail. This performance may be summarized by stating that socialist agriculture is meeting responsibly its obligations to society, has succeeded in eliminating the substantial differences that existed previously in the standard of living of farmers in comparison with other workers in the national economy, has vastly improved its performance in generating the resources needed to cover the justified requirements of its employees, and has developed the preconditions for the further development of the agricultural sector and the responsible fulfillment of its tasks in the Eighth 5-Year Plan.

The performance of this sector has been assisted immensely by the introduction of the improved planned management system for agriculture in 1982. This is proved by the performance of both plant and livestock production. An important factor in these improvements were better incentives for organizations and individuals not only to fulfill but to systematically increase both gross and marketable production. The implementation of the set of measures emphasized the need for a direct link between work performance and the level of compensation while at the same time assuring balanced development between increased labor productivity and the overall volume of wages paid. Also contributing to improved performance was a turnaround in the profitability of organizations in the state socialist sector of agriculture. These organizations met their targets under highly unfavorable conditions. Moreover, after years of showing not only planned losses but unplanned losses as well, since 1983 these enterprises have not only been fulfilling but overfulfilling profitability targets. This has improved not only their economic situation, but their standing in society as well.

The compensation situation in agriculture in the Seventh 5-Year Plan may be described as positive. Between 1980 and 1984 average wages and bonuses increased by almost 13 percent, 11 percent in the state socialist sector and 14 percent in the united agricultural cooperative [JZD] sector. At the same time these increased wages were matched by gains in labor productivity. This is indicated by the fact that in recent years there has been no undesirable exceeding of targets for resources designated for wages. This trend has contributed as well to eliminating the differences in wage levels between industry and agriculture (and between agriculture and the economy as a whole). Last year average wages in the state sector were for practical purposes at the level of wages in the national economy.

Offices of the Agricultural Employees Trade Union played an active role in these developments. Their efforts have been focused on the following:

-- developing individual and creative initiatives. so that enterprises and individuals can maximize their output and therefore their wages;

-- the consistent application of the principle that organizational performance and employee compensation move in tandem;

-- the implementation of systems and forms of compensation that effectively motivate individuals to deliver their best quantitative and qualitative performance;

-- the systematic improvement and upgrading of working and living conditions.

It is clear that the implementation of these principles has had a substantial impact on our agricultural performance. They have had a direct impact on every individual by creating a personal incentive for each person to actively participate in task fulfillment and in the systematic improvement of working conditions. This is, in fact, the only way that our agricultural sector can fulfill one of the basic conditions of task fulfillment--the stabilization of a highly qualified work force. Part of this stabilization policy is the relatively rapid growth in the capital asset per worker ratio and the resultant increase in productivity.

Last year the Central Committee of our trade union evaluated very critically the approach of economic and union organizations to task fulfillment during stage I of ZEUMS. Its report stated that during 1984 these tasks were only partially fulfilled. It emphasized that preparations required above all a comprehensive analysis of work management and organizations, including techniques and the maintenance of technical discipline. It therefore put on the record its disagreement with the view that ZEUMS is a task that enterprises either should or can fulfill only at the level of work and wage divisions, or by appointing enterprise standard setters. Efficiency enhancing measures must not only reduce labor and capital consumption, but at the same time upgrade the conditions of work and the working environment. The objective is for work, as provided in section 139 of the labor code, to bring people satisfaction and contribute to their well-rounded development. Furthermore, the degree to which these measures are implemented will be evident not only in immediate labor productivity but more importantly in labor productivity over the long term.

The Central Trade Union Council Presidium further noted that significant potential for improvement still exists in the time that is spent in documenting the work of individuals. Improving this documentation will make it possible both extensively and intensively to utilize work time, make the best use of the qualifications, professional experience, and abilities of every employee. Analyses have also shown that there are significant differences both by worker and by job in the fulfillment of performance standards. The capacity for fulfilling standards for repetitious activities at about 110 percent has a direct influence on the congruence between the planning of tasks and actual work in the sense that output standards provide a precise overview mainly of the extensive use of work time. This type of approach makes it possible to resolve two further pressing problems that are at the same time conditions for the implementation of stage II of ZEUMS. Specifically, these conditions are a reduction in overtime work as a percentage of total time worked and a further increase in wages for the successful fulfillment of qualitative targets, so that incentives account for about 25 percent of wages.

Criticism was also directed at the failure to act on the need for differentiating earnings in conjunction with the across the board application of the merit principle. We can no longer tolerate little or no differences in the amount of compensation between superior, average and mediocre workers. It has been demonstrated that wage levelling has a detrimental impact not only on individual output but also on worker morale and work force stability. Much can also still be accomplished by way of utilizing appropriate forms of wages. Proper forms of wages are those that offer direct incentives to workers to achieve the best possible quantitative and, to an increasing extent, qualitative performance.

Studies by offices of our trade union have also shown that tasks linked to improving the efficiency of the wage system in many organizations have not become an integral part of the daily activities of all managerial and administrative employees. This sort of attitude for practical purposes results in inadequate fulfillment of the tasks of stage I and therefore in a postponement of stage II. Considerable inertia was also discovered on the part of organizational management at the middle management level towards setting deadlines by which the conditions for implementing stage II of ZEUMS must be in place.

Our analysis indicated convincingly that the level of readiness within organizations for the implementation of stage II of ZEUMS--in the contrast to the previous modernization of the wage system--is about the same as in other economic sectors.

It is the opinion of our trade union council that this has come about because of the following:

-- close cooperation between central union agencies and sectoral ministries of agriculture and food in defining unresolved problems in the formulation and implementation of principles of the shift to and the development of stage II of ZEUMS, and the assurance of similar cooperation at the level of central, union, and enterprise levels of management;

-- the fulfillment of all tasks of stage I by those responsible;

-- the development of conditions that will make it possible to monitor stage II of ZEUMS during the current year at least one state farm and one JZD for organizations managed territorially and in each kraj, and in one enterprise per specialty for those organizations managed by specialty;

-- the assurance by the agencies and organizations of the trade union that a majority or organizations fulfilled the conditions for implementing the principles of stage II of ZEUMS by the beginning of the Eighth 5-Year Plan.

This position of the trade union agencies has been acknowledged by ministries and other managerial agencies. In addition, it has been the subject of joint discussions between the Trade Union Council Presidium and the ministries of agriculture and food of the CSSR, CSR and SSR.

This approach made it possible for the Government Wage Commission to agree to the implementation of stage II of ZEUMS at the first two state farms beginning on 1 July 1985. Depending on decisions of sectoral commissions, during the second half of 1985 stage II of ZEUMS may be implemented at other organizations to the extent provided for in the resolution of the Central Trade Union Council Presidium. One must caution, however, that wage systems here, in comparison with other sectors, have been updated generally with a 1-2 year delay. This then is further proof of the positive developments in agriculture and the gradual elimination of differences.

The issue of the compensation system for agricultural workers applies to more than 1 million employees. It covers mainly state farms, seed producing and livestock breeding state farms, large scale feedlot operations and other divisionally managed, specialized state organizations, machine and tractor stations, procurement organizations and other agricultural organizations. It also applies to cooperative organizations; JZD and joint agricultural enterprises. The structural makeup of these organizations (both their objectives and their locations) are very complex and varied. In their total of 1,800 organizations they are the most numerous of all the members of the trade union. When one includes the 1,700 JZD the total number of such organizations numbers around 3,500.

For this reason the fact that the actual implementation of stage I and, especially, stage II of ZEUMS is resulting in the further unification of basic principles may be considered a positive occurrence, because it ties together the generation of resources to be used in compensation, the system of compensating blue collar workers and blue collar positions, and the compensation system for technico-economic functions.

From the beginning of the Eighth 5-Year Plan this unification, in the area of regulations for forming resources used for compensation, will involve mainly the implementation of a system of single component regulation (in the state socialist sector regulation has to date been dual component). In addition, just as in other production sectors, there will be a shift from gross output to adjusted value added. The specific conditions of this sector (the impact of natural occurrences) requires that comprehensive insurance be arranged, and funds set aside sufficient to cover these risks. For purposes of monitoring the expenditure of wage resources (resources earmarked for compensation) it will be necessary to plan for additional wage costs for unplanned spring, harvest and autumn work necessitated by unfavorable weather as well as costs for soil reclamation. The proposed measures also provide for an expansion of the possibilities for counterplanning, up to the time when the economic plan is approved, and in full conjunction with public demand and the capacities of processing industries.

Compensation systems for blue collar workers in organizations of the state socialist sector and at joint agricultural enterprises on the one hand and for members performing blue collar tasks at JZD on the other hand that will be applicable during the Eighth 5-Year Plan are for practical purposes identical in their underlying principles for utilizing wage scales, qualification catalogs for blue collar jobs and the granting of personal categories, and in their evaluation of hazardous and health threatening working conditions for the purpose of setting compensation.

This evaluation included:

-- lists of jobs to which supplements apply in hazardous and health threatening conditions, both for agricultural production and for activities adopted from other sectors;

-- a list of physically very exhausting jobs and conditions for evaluating them;

-- the conditions for the designating of payment amounts.

Similarly, for technico-economic functions at organizations in the state socialist sector of agriculture and joint agricultural enterprises on the one hand and at JZD on the other hand unified principles will be implemented for setting wage rate scales and levels for merit bonuses, for establishing the criteria and actual use of a qualification catalog for technico-economic functions, and the principles for awarding supplementary payments for specific knowledge or knowledge of foreign languages.

For practical purposes, then, these will also be compatible principles for the use of increased wage scales, nomenclature and qualificational conditions, the definitions of technico-economic functions and the principles for classifying these functions according to wage scales. Also compatible will be the guidelines for using the qualifications catalog for technico-economic functions.

In terms of actual regulations, in the Eighth 5-Year Plan it will still be necessary to respect principles related to the position and form of incorporation of these qualifications into a specific job and the individual in a specific job. In cases of JZD members, the specific conditions of work in agriculture will be taken into account.

Differences between individuals who are in an employee relationship with a JZD and those who have a membership relation are most evident in the system of applicable wage scales. This is true of both blue collar and technico-economic jobs. Because individuals who have an employee relationship come under so-called gross rates (where a portion of the wage scale is made up of wage taxes), while members come under a so-called net rate (the compensation is not subject to wage taxes), a dual scale must be used:

a) for workers (i.e., all individuals in an employee relationship in the state socialist sector of agriculture, in joint agricultural enterprises--without regard for whether they are or are not also JZD members--and, finally, for individuals in an employee relationship with a JZD),

b) for JZD members (exclusive of JZD members who are in an employee relationship with a joint agricultural enterprise to which they were assigned by their home JZD) for whom scales derived from a) are used.

Blue Collar Activities

The rates published here relate to blue collar activities and are set as an hourly rate, assuming a 42.5 hour work week. In cases where regulations provide for a 41.25 or 40 hour work week a recalculated scale will be applied based on the above basic scales. In agriculture, plans are to continue to use a monthly wage (bonus) which will be derived from the appropriate basic scale.

Group 1 -- Scale No 1

This scale applies to associated production for jobs that come under a comparable scale in a main sector.

Class	1	2	3	4	5	6	7	8	9
a)	5.30	6.00	6.70	7.60	8.50	9.60	10.80	12.10	13.60
b)	4.50	5.10	5.70	6.40	7.10	8.00	8.90	9.80	10.90

Group II -- Scale No 2

This scale applies to the following functions and activities:

-- concierge, concierge-maintenance man, watchmen, guard, doorman, messenger, repairman for work clothes and accessories, copy clerk, canteen worker, cloakroom worker, janitor (m&f), scale operators, elevator operators;

-- heat generation for central heating buildings (boilers and exchange stations);

-- operation of dining hall and dormitory facilities, administration buildings, housing and educational facilities.

Class	1	2	3	4	5	6	7	8	9
a)	5.80	6.50	7.30	8.30	9.30	10.40	11.70	13.10	14.80
b)	5.00	5.60	6.20	6.90	7.70	8.60	9.50	10.60	11.80

Group II -- Scale No 3

-- production of artificial fodders;

-- processing, treatment and modification of agricultural products in agricultural procurement and supply organizations;

-- raising of decorative plants and mushrooms and final processing and packaging of seed and seedlings for the retail network;

-- livestock production--raising of poultry, laboratory animals and animals raised for furs;

-- personal automotive transport (including bus) and truck transportation in nonproduction organizations;

-- guarding workplaces where there are people serving time for removal of rights and warehouses for storage of explosives and Category I flammables;

-- waste water purification, sewerage network and facilities;

-- generation of heat and electricity in steam power plants and heating plants with a thermal output of up to 30 megawatts;

-- factory railway operations;

-- miscellaneous agricultural activities, including production of wine and gelatins, metalworking (machine production, including spare parts, metal pallets, assemblies, exchangers, tanks, boilers, radiators, mobile storage facilities, machine forming of metal, etc.); the production of concrete and reinforced concrete items, the collection and processing of waste metal.

Class	1	2	3	4	5	6	7	8	9
a)	6.00	6.70	7.60	8.50	9.60	10.80	12.10	13.60	15.30
b)	5.10	5.70	6.40	7.10	8.00	8.90	9.80	10.90	12.10

Group IV -- Scale No 4

-- livestock production not included in group 3, scale 3

-- plant production

When either of the previous 2 activities are engaged in by a nonagricultural organization compensation is according to a group--scale that is one level lower.

-- all types of truck transportation for agricultural, food, and other organizations involved in the mass delivery of products, deliveries to construction sites or to other large consumers and the transportation of large amounts of products, goods and components (raw materials, semi-finished goods, and products) including the specialized transportation of machines, equipment, prefabricated building panels and other sophisticated transportation tasks;

-- the large scale production of organic fertilizers (enhanced humus [vitahumus], industrial composts and fertilizer substrates);

-- the mining and processing of peat;

-- water purification utilizing mechanical, chemical and biological purification techniques for waste water that employ special techniques for the neutralization and elimination of pollutants for safety and health reasons (infection, radioactivity, etc.)

-- large construction divisions of nonconstruction organizations (construction groups for extensive capital construction);

-- other activities of agricultural organizations, including outdoor repair and assembly in agricultural and other organizations (of refrigeration or milking equipment for instance); forest husbandry activities, field work, the extraction and processing of rocks into rock based building materials (wall stone, gravel, crushed stone, etc.), the extraction and processing of other useful minerals (sand, limestone, etc.), sawmill products.

Class	1	2	3	4	5	6	7	8	9
a)	6.30	7.10	8.00	9.00	10.10	11.40	12.80	14.40	16.20
b)	5.40	6.00	6.70	7.50	8.40	9.30	10.30	11.50	12.80

Group V -- Scale No 5

-- work in veterinary disposal divisions (rendering plants [kafilerie]) and other similar work at JZD;

-- reclamation of land and construction of large drainage and irrigation systems on the agricultural soil stock;

-- the outside assembly of capital equipment, machinery and their general maintenance (such as production equipment for fodder mixtures, milking stations, and silos).

Class	1	2	3	4	5	6	7	8	9
a)	6.70	7.60	8.50	9.50	10.80	12.10	13.60	15.30	17.20
b)	5.70	6.40	7.10	8.00	8.90	9.80	10.90	12.10	13.50

Group VI -- Scale No 6

-- cleaning and maintenance of surface and subsurface sewer systems;

-- timber extraction in specialized organizational units, including cuttings made with motorized saws, the mechanical gathering of slashes after timber harvesting; the collection and transport of the raw timber from the departure point in the forest.

Class	1	2	3	4	5	6	7	8	9
a)	7.10	8.00	9.00	10.10	11.40	12.80	14.40	16.20	18.30
b)	6.00	6.70	7.50	8.40	9.30	10.30	11.50	12.80	14.30

Agricultural enterprises have the same potential for applying higher wage scales for blue collar employees as other sectors.

Technico-economic Functions

Similarly it is necessary to differentiate the rates used for technico-economic functions. The following monthly wage rates will be used:

Basic wage rate scale I will apply generally, scale Ia only for employees and members directly involved in production management, and scale Ib only on the basis of a decision issued by the pertinent ministry of agriculture.

Wage Rate Scales and Merit Bonus Levels

Rate Class	Monthly wage rates in korunas						Upper limit on merit bonuses in Kcs	
	Basic Level I		Level Ia		Level Ib			
	Member	Employee	Member	Employee	Member	Employee	Member	Employee
1	900	1000					200	300
2	950	1100					250	300
3	1000	1200					300	350
4	1100	1300					350	400
5	1250	1450					350	450
6	1350	1600	1450	1750			400	500
7	1450	1750	1600	1950			450	550
8	1600	1950	1750	2150			450	600
9	1750	2150	1900	2350	1900	2350	500	650
10	1900	2350	2100	2600	2100	2600	550	700
11	2100	2600	2300	2850	2300	2850	600	800
12	2400	3000	2600	3300	2500	3150	700	900
13	2600	3300	2850	3600	2850	3600	800	1000
14	2850	3600	3100	3950	3100	3950	850	1100
15	3100	3950			3400	4300	950	1200
16	3400	4300					1000	1300
17	3700	4700					1100	1400
18	4000	5100					1200	1550
19	4400	5600					1350	1700

The conditions specific to agricultural work are incorporated directly in the implementational guidelines. These serve to specify the following:

-- risk payments for work with animals including special regulations related to breeding and race horses;

-- time payment amounts for the feeding and caring of horses;

-- payments to employees and members of JZD employed in plant production who commit themselves to working for at least 4 weeks in livestock production when their work load slackens and to workers in livestock production who commit themselves to helping out during the peak seasons for plant production;

-- payments for workers and members who, based on a contractual obligation, perform work during periods of increased work load over and above any commitments entered into for the calendar year in question,

-- payments for work in livestock production operations,

-- principle of incentives for work on Saturday and Sunday;

-- principles of incentives for split shift work,

-- principles of wages and compensation and replacements for them under unfavorable weather conditions;

-- bonuses for preparedness for work in agriculture.

From the foregoing it is obvious that particularly during stage I of ZEUMS the agricultural sector generated, in close cooperation between its economic and union agencies, maximum efforts to resolve the problems which were evident in the compensation system. Another goal was to develop for the Eighth 5-Year Plan the necessary opportunity for a systematic increase in the efficiency of agricultural wage systems thereby contributing the responsible fulfillment of the tasks of the sector for our society, as well as providing for the justifiable needs of our workers, especially regarding their right to just compensation for their work.

BETTER SHEEP BREEDS THROUGH ARTIFICIAL INSEMINATION REALIZED

Bucharest STIINTA SI TEHNICA in Romanian No 12, Dec 85 pp 9-10

[Article by Dr. Stela Zamfirescu, Dr. Engr. G. Liciu, Engr. Mihai Mazilu, Engr. Florentina Ionescu, ICPCOC Palas-Constanta]

[Text] The documents of the 13th Party Congress plan the realization by the end of the 1986-1990 Five-Year Plan of herds of 28 million sheep and goats, concomitantly with the obtaining of quantitative and qualitative rises in the outputs of these species of domestic animals, major objectives of animal husbandry that can be achieved only by bettering the existing breeds. Artificial insemination is the most efficient of the methods used for this purpose.

This method, utilized on a large scale during the 1960-1975 period, was largely instrumental in accelerating the rate of genetically improving the sheep herds, while renunciation of this method resulted in a drop in fecundity, natality and prolificity, caused by use in reproduction, by natural breeding, of inadequate rams. Artificial insemination is a long-range biotechnical method involving the only means of diffusion of genetic progress and application of latest means of selection of breeders. It assures scientific control of reproduction and monitoring of the fertility of herds, specifically of the selected populations. As a major instrument in improving sheep breeds artificial insemination must be viewed in the context of the outstanding discoveries of biological sciences and of the rapid technical progress made in the last decade.

Practical reintroduction of this method necessitates scientific restructuring and ensuring of the corresponding material and technical basis. Coupling in succession of artificial insemination with other biotechnical methods for intensifying sheep breeding, such as inducing and synchronizing the estrus, early determination of gestation, embryo transfer, maximizesits results. Practice has demonstrated that where artificial insemination is correctly organized and applied, regardless of species, it provides the guarantee of obtaining a high output. Moreover, intensive use in breeding of tested rams of a high zootechnical value or utilization of the stock of genes provided by varius breeds of imported rams brings about breeds of better quality. Utilization in breeding of improver tested rams with higher genetic value is the outcome of selection based on individual performance or descendance. In this context, intensified selection is obtained only by applying artificial insemination through diffusion of the sperm of improver rams in a large number of sheep (500-1000 ewes/ram).

The advantage in terms of sanitary-veterinary factors of artificial insemination in sheep consists in that it is the means of avoiding the propagation of contagious diseases (brucellosis, infectious epididymitis, chlamydiosis, vibriosis, and the like) which can cause considerable economic damages. The rams used in artificial insemination are subjected to clinical and laboratory control in accordance with the laws in force, in this way ensuring full sanitary guarantee. Further, but not lastly, this method also provides economic advantages that involve greater productions, obtained as a result of stepped-up breeding following insemination with diluted, refrigerated or frozen seminal material of a larger number of sheep. Furthermore, encouraging results have been obtained following the international exchange of genes through frozen seminal material carried on with countries that conduct advanced animal raising, that is fully accepted and eliminates the drawback of the acclimatation stress. Moreover, freezing in liquid nitrogen permits conservation of the seminal material recollected from valuable rams outside the natural breeding season and its stocking for an unlimited period. Lastly, another economic advatage involves numerical reduction of the ram herds and consequently of expenditures related to their maintenance, in favor of numerical increase in mother ewes. Further, intensive utilization of seminal material from rams of Australian Merino, Polwarth, Corriedale. Awassi, Friza breeds, for the purpose of improving our local breeds, cannot be realized without application of artificial insemination. In 1984, for instance, rams from the import nuclei, in the amount of 26,000, were not used adequately, as they naturally bred only 209,300 ewes, a situation that is not in accordance with the purpose for which they were imported. The aspects described are only a few of the ones that are designed to argue in favor of resumption of use of artificial insemination in sheep.

Organizationally the program for artificial insemination of sheep and goats is proceeding under coordination of the National Center for Animal Breeding and Selection (CRRSA), with the major operation centers being the ones for collection and diffusion of the seminal material and for artificial insemination (PIAO) proper. In order to efficiently meet the economic need it is necessary for a center for processing the seminal material to ensure the biological material for about 30,000-50,000 breeding ewes over a radius of 10-15 km, and for the artificial insemination centers to use the material on herds numbering between 1000 and 1500 ewes. The artificial insemination centers should be located on farms where the sheep herds occur on a radius of 1-2 km, that would permit the monitoring of the cycle of heats and completion of the operation at the optimal time. The socialist units with larger herds of breeding sheep may organize their own centers for collection and dilution of the seminal material.

Artificial insemination involves a complex activity that encompasses many technical and organizational facets. The program must be well conceived and prepared at least 2 months before the breeding campaign, because its duration limited to 1-2 gametogenous cycles (34 days) causes irreversible effects of any nonrealization from the stages under the improvement program. The measures that should be taken early mainly involve preparation 35-40 days before the breeding campaign of the breeding rams; determination of the herds of mother ewes for artificial insemination and of the locations where this operation will be completed; provision of these locations with the necessary equipment; organization of the sperm transport; training of personnel, and so forth. The success and results of artificial insemination depend on a number of factors and prominent among them are: the physiological condition of the breeders (male and female), correct detection of the estrus, insemination at the optimal time, the point for sperm inoculation, the quantity and quality of the doses inoculated, the skill of the operators. The success of artificial insemination can be ensured only in the context of strict following of techniques for production of the various types of seminal material (crude, diluted-refrigerated and frozen), and of the insemination techniques. A synthetic presentation of the conditions for use of the seminal material preserved in different forms and also of the results obtained are provided in table No 1. [table not included]

As a result of the special anatomical characteristics of the cervix in ewes, the seminal material is deposited at the entrance to the cervix or, depending on its opening degree, as far as at most 1.5-2.5 cm. The methods that provides the best results is profound intracervical insemination by means of the vaginal speculum with individual light (vaginoscope). Moreover, there is the semiautomatic insemination syringe which permits inoculation of the dose of 0.1 ml of seminal material, replacing the traditional suction pipette. For the purpose of obtaining good results artificial insemination should be performed directly by personnel with higher and medium-grade training, while prohibiting performing by personnel without basic zootechnical or veterinary training. Failure in artificial insemination may be due to insufficient preparation of rams and mother ewes, operation performed on still nursing ewes or immediately after weaning or to stress factors (shearing, bath against scabies, vaccination, frequent and rough handling, excessive heat, storms, noises).

In the case of artificial insemination in sheep, organization of breeding and strict following of instructions on monitoring reproduction are constant tasks that confront technical personnel on sheep farms and at the centers for production and distribution of seminal material. The sheep farms at the top of the improvement pyramid (choice females and daughter females) must primarily apply the method of artificial insemination and highly intensively use valuable rams. Intensive utilization of breeders acutely poses the problem of testing these rams based upon individual performance and descendance, specifically for estimation of descendance and removal of breeders that produce offspring with weak productive qualities.

In recent years, the sheep breeding indices have quite unjustifiably declined, resulting in a stagnation of wool productions. In addition to some known causes, related to deficiencies and shortcomings that existed in the feeding and upkeep of breeding sheep, there was much too easy renunciation of artificial insemination and almost exclusive use of natural breeding, that constituted the principal limitative factor in sheep breed improvement and implicitly in increasing production. The key motive of easy renunciation of artificial inseminations involved the consequence of inadequate expansion of the material base and of the organizational framework ensured in their development. Therefore, in order to correct this situation, as early as this year artificial insemination in sheep breeding should be reconsidered in terms of reintroducing it as an advanced biotechnical method in all agricultural sectors. In light of the importance of this program, it must be performed under the best possible conditions, in the context of competent supervision of the development of every link in the technological chain of breeding, of all operations for preparation and completion.

FRG DAILY COMMENTS ON ECONOMIC DEVELOPMENT, PRICES

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 10 Feb 86 p 12

[Article by Lothar Julitz, datelined Sofia, in February: "Bulgaria Produces Electronics Now--the Federal Republic is the Most Important Western Trade Partner"]

[Text] "Everyshop window in Sofia is a temptation. The selection is big--all you have to do is choose." With these words the Bulgarian Association for Tourism and Recreation Matters promotes a stroll in the capital of the country. These days, whoever experiences the rush of the Bulgarians to the "department store" at Lenin Square or to the kiosks of the "Tsum" set up outside (the building of the biggest department store in the capital is now being renovated), notes not only an obviously wide selection of foodstuffs and semiluxury foods and tobacco, of textiles and clothing, but he also hears the cash registers "ring" in the truest sense of the word.

There are grounds for the assumption that the range of goods for sale and the rush of customers are connected with the preparations for the 13th BCP Congress that will take place in April. The parallel to Eastern cities holding a trade fair is obvious. The snapshot of the chance observer in the Bulgarian capital shows a measure of plentiful supplies in various groups of goods.

The Bulgarians have acquired a modest prosperity in recent years in comparison with other Bloc countries by relatively high growth rates in the economy and by a partially pragmatic economic policy (more freedom of choice and more responsibility of their own for the enterprises; a little more leeway for the private sector). Then came 1985: a severe winter, a growing energy shortage, planning failures, drought, a bad harvest. At the end of the chain, finally a series of price increases: the prices of consumer goods are said to have risen by an average of 10 to 15 percent in the fall of 1985. As a consequence of the drastically reduced energy deliveries from the Soviet Union, the price of gasoline increased 35 percent, that of electric current for households, 41 percent.

"The main task of the socioeconomic development in socialist Bulgaria consists in the increasingly better satisfaction of the constantly growing material and intellectual needs of the people," it is stated in the "1985 Economic Survey" published by the Bulgarian Chamber of Commerce and Industry. This publication shows that the Bulgarians had an annual 1984 income in wages and salaries averaging 2,488 leva (according to the official rate of exchange 100 DM correspond to roughly 110 leva with an "exchange bonus of 80 percent") or 207 leva per month. During the past year this average rate could have increased to 210 to 220 leva.

Undoubtedly it is to be taken into consideration that in Bulgaria school, training and medical care are free of charge, that the rents and the cost of travel on public transportation (in Sofia 0.07 leva regardless of the means of transportation and distance of travel) are low. On the other hand, the visitor can easily ascertain by the prices for important cost of living items in the stores that the level of prosperity is modest. Thus, e.g., a men's overcoat costs between 100 and 200 leva, a ladies dress between 30 and 135 leva, a men's suit between 70 and 150 leva, a pullover, 30 to 70 leva. A color TV set of Soviet manufacture already requires an investment of 850 leva, in other words four times an average monthly income. In a shoe store on ulitsa Positano at the corner of Tsar Kaloyan, "addidas" gym shoes had just arrived with a price tag of 48 leva. Positively prohibitive were the prices for high-grade goods: for a bottle of Scotch whiskey the citizens of Sofia have to spend 38.55 leva. In one of the Corecom (foreign exchange) stores, the price tag for "Chivas Regal" whiskey reads 15 dollars, that for 24 cans of Coca Cola (0.33 liters), 12 dollars; half a kilogram of Vienna coffee costs 4 dollars.

Nevertheless some--though not all--of the Bloc countries envy the Bulgarians for their standard of living. An agricultural country has become an industrial country since the war and the 1944 coup. Thus according to official data, the GNP on the average for the years from 1960 to 1980 has grown by more than 7 percent, industrial production by over 9 percent, foreign trade by over 11 percent. For the 1981-1985 plan period, which was burdened by the difficult development during the past year, the average increase of the national product is stated to be about 5 percent. The per capita national product has increased in real terms by nearly 3 percent a year, whatever that may mean in concrete terms. This development was based--it can be heard in conversations in Sofia not without pride--especially on the economic principle of "promoting industry without neglecting agriculture."

Prior to 1944 more than four-fifths of the gainfully employed were in agriculture. Now one fifth of the gainfully employed work in agriculture but produce several times the production of 1944. In the meantime industry employs 37 percent of the gainfully employed who produce almost 60 percent of the national product. Pronounced growth fields have been in past years especially machine building, electronics, the energy industry and chemistry. For the 1986-1990 five-year plan period, machine building and electronics are supposed to be again the two decisive branches of the economy, according to Deputy Minister for Machine Building Stamenov in Sofia. Considerable increases have again been planned for all important fields.

In the development of the electronics industry Bulgaria is regarded by some observiers as a "Silicon Valley of the Bloc": More than 80 percent of the electronic memory equipment is now produced in Bulgaria; more than half of the Bulgarian exports consists of electronically controlled machines. A further consequence of the division of labor decided on by the CEMA member countries is the concentration of the production of electrically operated means of hoisting and transportation in Bulgaria. Thus, e.g., the "Balcancar" enterprise regards itself as internationally one of the biggest manufacturers of electric forklifts: about 45,000 persons are employed in over 35 enterprises.

"The economic relations with the Federal Republic are good; but they could be even better." This is how Deputy Foreign Trade Minister Kusmov summarized the assessment by the Bulgarian government in Sofia. German industry is one of the most important suppliers of technical know-how; the Federal Republic at the same time is the most important trade partner among the Western industrial countries. Starting points of the criticism of the Bulgarians are the trade restrictions in the Federal Republic which exist in their opinion, especially in the agricultural field as well as for textile products. As regards Bulgarian imports, import prohibitions based on the COCOM list (strategically important goods) are pointed out.

Measured by the total foreign trade transactions (exports and imports) Bulgaria is the smallest trade partner of the FRG among the Bloc countries; its share in the total FRG foreign trade transactions is less than one percent. The development over the past ten years is also not very impressive--an increase from 1.3 to 2.1 billion DM. Since 1980, the German export has increased from nearly 0.9 to 1.7 billion DM (1985), the import from 0.3 to 0.4 billion DM. Exports to Bulgaria include especially machines, chemical products, electrical engineering products as well as textiles and clothing. The Bulgarians deliver especially agricultural products, foodstuffs and semiluxury foods, textiles and clothing, petroleum products as well as iron and steel.

GROWTH OF TRADE WITH BULGARIA VIEWED

Prague SVET HOSPODARSTVI in Czech No 150, 1985 p 2

[Article by Miroslav Marek of PZO Strojexport]

[Text] The broad base of domestic manufacturing, delivery and consumer organizations is the basis for the extensive relationships with the companies of the wide variety of branches of the industrial sector of Bulgaria, and this is true of exports as well as imports. In its 32 years of commercial activity, Strojexport cooperated with a whole series of Bulgarian organizations, of which some of the most prominent are Balkancar, Balkancarpodem, Technoexport, Izotimpex, Masinoexport, Bioinvest, Transimpex, Intransmas, Technoimport and others.

In the 1960s certain profound changes took place, especially in the structure of the Bulgarian exports to the CSSR. Industrial products gained an important position in these exports, particularly the battery driven vehicles and electrically powered cable and chain hoisting equipment. On the basis of a recommendation by CEMA, specialization in the battery powered vehicles and hoisting equipment took place, much to the advantage of Bulgaria.

In the framework of the exemplary cooperation of Strojexport and Balkancar and Balkancarpodem such a growth of imports of the electric vehicles and hoisting equipment occured, that today CSSR is one of the largest buyers of these machines.

Gradually the imports by Strojexport from Bulgaria not only grew in total revenues but also diversified. Through Masinoexport it imports hydraulic and penumatic elements and radiators, electrical installation materials and high tension electricity technology through Elektroimpex, pumps through Technoexport and Agromasinaimpex, warehousing technology through Intransmas, scales through Izoimpex etc. Imports by Strojexport from Bulgaria reached such a pace that in the last few years they exceeded its exports to the Bulgarian market.

As far as our exports are concerned, in the 1960s and 1970s Strojexport supplied locomotives, railroad cars, heavy equipment and some technological equipment for critical construction in Bulgaria. The most important of these was the equipment for the copper ore handling plant located at the copper mines at Medet. During the next few years our exports consisted chiefly of construction and road building machinery. Through Technoexport and Transimpex our Bulgarian partners receive particularly the universal loaders UN 50 and UN 053.1, the shovel excavator E 302 and 303, front loader UNC 151 and UNC 200, loader UNK 320, the universal finishing machine UDS 110, excavators DH 101 and DH 113, pneumatic roller GRW 101, rollers type VV 100, VW 3402 and VSH 100, vane type cement mixers VD 6 and AP 174, dump vehicles, automatic cement mixers etc. Beside the construction equipment, the primary exports of Strojexport to Bulgaria are mining equipment, window climate control units, injectors etc.

In this year Strojexport will export to Bulgaria chiefly construction equipment and road building machinery with the appropriate accessory equipment and spare parts valued at R17 million. Some of these are the auto mixer AM 369, dump vehicle T 200, loaders, excavators, rollers of various types, and additional spare parts for the ore handling facility at Medet and for the heavy equipment and mining machinery, injectors, window climate control units, etc. We will import battery and motor powered vechiles, add on equipment for the AKU vehicles and trailers, hoisting equipment, switching equipment STOBET, scales, containers, etc.

Since 1981, there has been cooperation in the manufacturing of individual window climate control units of up to 4000W, in which the CSSR manufacturer supplies the heating unit, the evaporator, and the air exchange window unit and the Bulgarian side supplies the cooling condenser and compressor aggregate for air cooling, manufactured under a license from the Japanese company Sanyo. The objective cooperation shows a great promise in its development and has a realistic perspective. The volume of this mutual exchange of goods is somewhere around R one million per year for each side.

Even through the present results of the mutual exchange of goods are unquestionably positive, the domestic markets of both countries will be more demanding in the future, particularly in modernization, innovation and manufacturing of new and more effective and economical types of equipment: and the producers of both countries are reacting positively to these demands.

KUBAT VIEWS ELECTRONICS INDUSTRY BETWEEN 5-YEAR PLANS

Prague HOSPODARSKE NOVINY in Czech No 46, 1985 pp 1, 6

[Article by Prof Eng Milan Kubat, DrSc, minister of CSSR electrical engineering industry: "At the Turn of the New 5-Year Plan"]

[Text] The interest of the public and experts in electrical engineering and electronics is closely linked to their importance for the further development of all sectors of the national economy. The 16th CPCZ Congress ruled that the production volume of electrical engineering industry was to increase 40-50 percent during the Seventh 5-Year Plan. In 1981, however, the targets of the 5-year plan were revised because of the deterioration of the international situation, shrinking fuel, energy, material and raw materials resources. As a result the dynamism was reduced and pressure for intensification increased.

Growth Rates Are Higher

This affected also the plan of the electrical engineering industry. Our sector, however, did not passively accept the planned reduction of dynamism, but on the contrary, despite the reduced resources, offered higher growth rates than those considered in the revision of the 5-year plan.

On the basis of the higher targets accepted in the counterplans, the 10th plenary session of the CPCZ Central Committee set for our sector the goal to come as close as possible to the upper limit of production increase specified by the 16th CPCZ Congress. Instead of the 138-142 percent rate set for the electrical engineering industry by the law on the Seventh 5-Year Plan, we want to achieve a 149 percent growth.

In contrast to the directive for the Seventh 5-Year Plan, we plan to increase the commodity production by almost Kcs 8 billion by the end of this year. We met the 5-year plan target in the adjusted net output as of 30 October 1985, and we want to exceed this indicator Kcs 3 billion by the end of the year.

As to production, the Seventh 5-Year Plan target will be substantially surpassed--by Kcs 2.4 billion--in the deliveries for the investment projects. We will contribute to the implementation of capital investment plans and to better supplying of the national economy with the computers.

The Seventh 5-Year Plan target for the deliveries to the consumer goods inventories was surpassed by Kcs 1.5 billion both in the wholesale and retail prices. During the 5-year plan the increase in the consumer goods inventories at retail prices will represent Kcs 3 billion, the increase in wages paid in our sector Kcs 1.5 billion.

With regard to export to the socialist countries the annual plans which are in conformity with the annual protocols on commodity exchange are fulfilled. Exports to the nonsocialist countries, however, are not completely met either in terms of the 5-year plan targets or annual plans which were reduced in view of the international situation. This was affected by the lower fulfillment during the 1981-1982 period. In the subsequent year the annual plans were fulfilled.

This 5-year plan's targets will be substantially surpassed in the area of component parts, computers, measuring and control devices. The conditions were thus created for an eccelerated electronization of the national economy.

The sector of microelectronic components in particular has achieved high dynamism. In comparison with the year 1980 the production of progressive integrated circuits increased more than 3.5 fold. Conditions were created for the introduction of micro-processor production, including auxiliary circuits of 8000 series, RAM, RUM and EPROM memories and other circuits indispensable for the construction of computer systems. Furthermore, manufacture started of integrated circuits of CMDS technologies noted by the low electric energy consumption which is expressed in microwatts. One-chip microcomputers are also being produced.

In the course of the Seventh 5-Year Plan we started with production of a large assortment of computers of the SMEP series which made possible the application of computers in additional areas of the national economy. Microcomputers SM 50/40 and SM 50/50 for example are used for control of robots and manipulators, while microcomputers SM 4-20 and SM 52/00 constitute the basis of specialized complexes for health care, agriculture and are employed also in control of the power sector and automated control systems for technological processes and production.

New Products

As the first among the CEMA countries we are preparing for production a 32-bit microcomputer SM 52/12. It will make it possible for us to create efficient interaction systems for computerized design and construction.

In the category of medium-size computers we began with the manufacture of EC 1025, 1026 and 1027 systems. EC 1027 became available this year.
Its output is 400,000 operations per second has the 1-2 megabytes capacity of semiconductor operational memory on 16 kilobit memory elements MHB 4116 of Czechoslovak manufacture. EC 1024 computers represent a good basis for designing computerized control systems in the nonproduction area.

The new microelectronic components based on 8080 microprocessor and microcomputers 8048 constituted also a good start for the manufacture of Czechoslovak personal computers of the SMEP series--PP 01, 02, 03 and 04 as well as of other types developed on our initiative. Among the latter are personal microcomputers IQ 151 for schools, personal microcomputers PMD 85 for consumer good inventories and further self-improvement, composite microcomputers for schools PMI 80 and industrial control units SAPI 1 and SAPI 80.

In the category of peripheral equipment we started production of mosaic printers, alphabetically digital and graphic displays, efficient chain printers and recently also electrostatic impactles (bezuderovy) printers. Despite the rapidly expanding manufacture of peripheral equipment there are precisely in this area the biggest capacity problems which limit the final complementation of the computer systems.

In investment electronics we started to manufacture in the course of the Seventh 5-Year Plan fully electronic branch telephone exchanges and telephones with push button dialing. Likewise the TV and radio transmitters as well as studio and transmission equipment were modernized. A completely new area which we entered during this 5-year plan is the manufacture of sets receiving the television and radio programs directly from the satellites.

Development has started on the new generation of completely electronic telephone exchanges for municipal calls and branch telephone exchanges of big capacities. In telecommunications both these projects will be of key importance also during the priod of the Eighth 5-Year Plan, when their results will be gradually applied in production. I could mention also other sectors such as measuring and laboratory equipment where we succeeded in cooperation with CSAV [Czechoslovak Academy of Sciences] in manufacturing the first Czechoslovak electronic lithograph, in medical equipment it is a number of new instruments increasingly using electronics, including equipment for cryosurgery and the like.

The control systems for production machinery represent a separate chapter of automation application. In the course of this 5-year plan new CNC control systems have been developed and used for rectangular and continuous control of lathes, cutters, boring machines and their centers. These systems are likewise being prepared for the forming machines. The control systems operate on the basis of microprocessors and have a progressive modular composite design which makes possible their employment also in the control of integrated robots and manipulators. Programmable automatons proved themselves both in this country and abroad. The modern electronic base largely contributes also to the modernization of efficient action elements, automation of linear and jogging [krokovy] power drives [servopohony] for shifting and spindles of machine tools.

We have paid attention also to the expansion of production and innovations of consumer electronics. The biggest progress has been achieved in color TV sets. The basic model of the color TV Czechoslovak-made set with a diagonal 67 cm long has been supplemented with a model with a diagonal 58 cm long and two portable color TV sets with 42 cm and 30 cm diagonals respectively. The useful value of TV table model sets has been enhanced by remote control.

The innovation of coil tape recorders emphasizes the hi-fi quality and semiprofessional design. There appeared recently on the market a minicasette player KM 340 [walkman] as well as the first VCRs. Their assortment will increase next year by the types manufactured in production cooperation with the USSR and PHILIPS firm with which we cooperate also on the development of the digital CD recorder.

Despite the high production growth rates which have been achieved during the Seventh 5-Year Plan we were not able to meet the requirements of the national economy completely. This is particularly true of the sectors of the component parts, computer equipment, measuring and regulatory equipment and cables.

What Is Required of Us?

All this demonstrates that, in comparison with this 5-year plan, we shall have to substantially increase in the forthcoming 5-year period the annual growth rates of both production and innovation. The negotiations on supplier-customer relations for the Eighth 5-Year Plan have confirmed that the doubts about the national economy not being able to absorb the planned production volumes are absolutely unjustified. At the same time it became clear that the customers are still not able to express their needs reliably ahead of time.

In drawing up the Eighth 5-Year Plan we proceeded from the Conception of the Growth of Electrical Engineering Industry up to 1995 which was apporoved by the CSSR Government presidium as the documentary material for the preparation of the Eighth 5-Year Plan guidelines. The second important document was the Long-Term Comprehensive Program of Electronization of the National Economy adopted by the CSSR Government in September 1984. This document contains the tentative plans for the electronics application in the selected key sectors of the national economy and for the expansion of key sectors. Among them are the component parts basis, technological facilities, technical means for control and automation, in other words sectors securing the material-technical basis of electronization.

One of the highest production increases in the national economy ever is being planned in the electrical engineering industry for the Eighth 5-Year Plan--approximately 160-165 percent. This head start on expansion of electrical engineering industry is to create the fundamental condition for the implementation of the long-term comprehensive program of electronization. The production increase in our sector aims particularly at the production of material resources for this program and is contained in the state target program 07--The Expansion of Material--Technical Basis. Program 07 concerns especially the production of semiconductor and microelectronic elements, computer and automation systems and special purpose technological equipment for electronics production. Within the framework of our sector, we are proposing varied growth rates from 180 to 300 percent for individual branches.

In the next 5-year plan we assign priority to the investments for the increased production of component parts, special purpose machinery, robots and manipulators, while reducing at the same time the growth rate of high-voltage (silnoproudovy) electrical engineering requiring a great deal of materials. Investment funds which will be at our disposal will be twice as large as in the Seventh 5-Year Plan. Three quarters of them are designed to effect the modernization of the technological basis of our sector with the emphasis on the replacement of obsolete and worn-out machinery. The increase in the capacity of our production of special-purpose technological equipment will significantly contribute to the technological modernization of our sector.

We expect the investments in technology to contribute to a substantial increase in labor productivity which in comparison with the Seventh 5-Year Plan is almost to triple. One of the consequences of this labor productivity increase will be further price reduction primarily of electronic components and thus also of end products. In the final analysis this should contribute to the more rapid application of electronics in the national economy.

Where Cooperation Helps

The most important precondition of structural changes is the more intensive participation of our sector in the international division of labor. The Soviet Union was, is and will remain also in the future our principal partner. The problems solved in our scientific-technical cooperation with the USSR cover a large area of topics from microelectronic components to communications, computers, automation and medical instruments, consumer electronics to high-voltage electrical equipment.

As an example of successful division of labor we can mention the development of facilities for electron litography BS 600 including comprehensively equipping the entire technological process of manufacture of VLSI (very high integration) integrated circuits with an additional complex equipment for control of surface properties of solid substances. In view of the complexity and demanding production requirements this equipment is manufactured only by a few top firms in the world.

The development of integrated circuits LSI (high integration) of the K 580 series has also been successfully concluded. Its advantage is the comprehensive approach including quality, reliability, programming and testing equipment. Together with our Soviet partner we are preparing additional projects for scientific-technical cooperation among which are:

--innovation of color picture tubes;

--computerized design of VLSI integrated circuits on the basis of a 32-bit minicomputer;

--integrated circuits for cardiostimulators;

--metal x-ray converters of large diameter;

--development of modern vacuum exchanges;

--TV transmitters;

--studio equipment.

A new perspective area of cooperation is the complex of equipmetn for the data transmission by light conductors [svetlovody] in regard to which a program of scientific-technical cooperation has been formulated for the 1986-1990 period.

Consumer electronics is a separate area of scientific-technical cooperation. Here a successful start was made for joint work on video tape recorder, a portable color TV set. Cooperation is expected to be expanded to include casette automatic recorder (kazetove prehravace), advanced phonograph equipment, lithium batteries for pocket calculators and electronic wrist watches.

Cooperation of both countries in science and technology is reflected also in other areas. On the basis of consultations of CSSR and USSR planning agencies it is anticipated that in comparison with the Seventh 5-Year Plan the exports to the USSR will increase 75 percent and imports form the USSR 98 percent during the Eighth 5-Year Plan.

Our second biggest partner is the GDR where cooperation is focused on electronic components, high-voltage electrical engineering, medical appliances, measuring and regulatory equipment. A total of 25 contracts have already been signed with the GDR on production specialization in the above areas and additional contracts are being worked out. On the governmental level an agreement was signed with the GDR in 1983 on cooperation in the manufacture of color television tubes. The subject of this agreement is the specialization and cooperation in development, production and mutual deliveries of a number of materials, semi-finished products and subassemblies in glass and chemical industry, metallurgy and electrical engineering.

Likewise, thought on a smaller scale, cooperation develops with other partners among the socialist countries including Vietnam, Cuba, the Mongolian People's Republic, Korean People's Republic and Yugoslavia. A total of 36 multilateral and 55 bilateral contracts have been signed by our sector on cooperation with the socialist countries. These contracts will be extended for the period of the Eighth 5-Year Plan. By the end of the Eighth 5-Year Plan already 65 percent of the total export volume will be secured by contracts.

Electronics has become an indispensable condition of further production increase, intensification of the national economy and Czechoslovakia's successes on the foreign markets. Its share in engineering production will further increase from the present 17 percent to approximately 22 percent by 1990. We are entering the Eighth 5-Year Plan with determined resolution to work better, to achieve higher labor productivity and high technical standard. To promote the program of electronization which the Czechoslovak economy has set for itself.

INTERNATIONAL R&D ASSOCIATION 'ROBOT' DISCUSSED

Prague PODNIKOVA ORGANIZACE in Czech No 9, 1985 pp 379-382

[Article by Eng Vratislav Valek, candidate for doctor of science, Federal Ministry of Finance: "The Association 'ROBOT'; an Example of Direct Khozraschot Relations Within the CEMA"]

[Text] The senior level economic conference of the CEMA member countries emphasized the need for the broad development of direct relations among the agencies and khozraschot organizations of the interested countries, in the form of production cooperation and specialization, international R&D associations, joint ventures, etc. One of the specific examples in this area has become the establishment of the international R&D association "ROBOT" in March 1985 between participating organizations of the CSSR and the SSSR. It is significant that the area of cooperation chosen for this association is in advanced engineering--namely the research, development, engineering and production of industrial robots and manipulators the outputs of which contribute to improved productivity and efficiency in other economic sectors.

Basic Considerations

The 23d Plenum of the CEMA approved a "General Agreement on Multilateral Cooperation in the Development and Organization of Specialized and Cooperative Production of Industrial Robots," with a time frame for fulfillment that extends to the end of 1995. The areas of cooperation between the CEMA member countries will be as follows:

--Analysis of the existing designs of automated manipulators with programmed controls (industrial robots) used in various branches of the national economy of the socialist countries and in world robotization activities;

--Preparation of proposed agreements (protocols) and the upgrading of existing contracts regarding R&D cooperation in the development and production of industrial robots;

--Preparation of contract proposals to intensify and expand cooperation and production specialization of industrial robots, unified parts, and their components;

--When necessary the preparation of proposals to expand existing and build new facilities through the joint efforts by participating CEMA countries to produce automated manipulators with programmable controls, unified junctions, and their components.

The above description of program cooperation shows that this is a broadly used program that focuses on all parts of the development-production-use cycle, including potential joint investment activities. In the CSSR a state priority program for robotization was formulated for the Seventh 5-Year Plan that provided for the introduction by the end of 1985 into the production process of 3,000 industrial robots, a number that is projected to increase to 13,000 by 1990. These installations are projected to eliminate 5,000 employees in 1985, with labor savings by 1990 to run to the order of 30,000 employees. In addition, users of these robots will realize further savings and improvements including increased labor productivity, reduced energy intensiveness of production, the elimination of heavy and risky work, etc.

In our economy the largest producers of industrial robots and manipulators are Presov Industrial Automation factories [ZPA], Snina Vihorlat, Kolin Tesla, Plzen Skoda, the Bratislava Automotive Factories [BAZ], the Detva Heavy Engineering Works [ZTS], Prague ZEZ, the Kosice Heavy Engineering Works [ZTS], and others. Industrial robots have already been installed successfully at the Mlada Boleslav Automotive Plants [AZNP], national enterprise, the Dubnica Heavy Engineering Works [ZTS], the Strakonice Czechoslovak Motorcycle plant [CZM], the Nove Mesto Kysucke Ball Bearing Plant [ZVL], the Kosice East Slovak Machine Works [VSS], and others. The principal coordinator of research and development is the Research Institute for the Metals Industry [VUKOV] in Presov, a facility that has already had a number of successes in international cooperation within the context of the CEMA. The main partners in these cooperative efforts have been the USSR, GDR and Bulgaria.

The importance attached to the rapid development of robotization in the CSSR and the USSR has led both sides to formulate the Agreement Between Both Governments Concerning Cooperation in the Development of Robotics Technology Complexes and Flexible Production Systems and on the Establishment of the International Association "ROBOT." In a relatively short time we have succeeded in reaching fundamental agreement on an overall approach to the specific objectives of cooperation, the organizational forms for their resolution, and to resolve the related basic technical, economic, organizational and other issues.

Cooperation between the CSSR and the USSR in the area of industrial robots and manipulators has already developed a history. Its first products were demonstrated at the "Robot" 1982 exhibition in Brno, where a simulated worksite was constructed for the operation of equipment with the universal UM160 manipulator of joint Czechoslovak-Soviet development, an automated forming work station, etc. In this 5-year plan one objective of cooperation is the development of prototype series for machining and interoperational handling of workpieces and plates up to 160 kilograms in weight, along with a joint special purpose manipulator for pressure castings, a new type of industrial robot for flat forming at high work speeds, and an alternative control technology based on microelectronics and fluidics for explosive environments.

Joint Czechoslovak-Soviet cooperation in this field has also been implemented through joint design, engineering and technological office, "ROBOT." All experiences to date have been evaluated during the formulation of ensuing cooperative programs. These later programs involve the recruitment of specific khozraschot entities of both countries for R&D and economic cooperation through the international R&D association "ROBOT." From this viewpoint specifying the content of the activities of this association and resolving the organizational and institutional links between the participating entities is of great importance. Another important component of the management mechanism is the system for allocating and selling the products that are produced.

Objective of Activities and Organizational (Management) Structure

Cooperative activities are expressly defined within the context of the International R&D Association "ROBOT" in the Program of Research, Development, Design-Technical and Experimental Work, the Production of Prototypes and Test Series of Robotics Equipment Complexes and Flexible Production Systems for 1985-1990, which represents an inseparable component of the intergovernmental Czechoslovak-Soviet agreement. Specifically, this cooperation will be implemented in the form of agreements concluded in line with the legal codes of the CSSR and the USSR. The adopted program has three basic parts:

--R&D and engineering-development work,

--Design-engineering and technical activities,

--Production, complete deliveries of systems and the necessary service.

The first part above includes concepts for the development of robotized complexes, flexible production systems and their controls, including unification and standardization, the development of a system of R&D information and for resolving patent rights issues. A second aspect of cooperation focuses on the development of prototype designs for flexible automated systems for machining and forming applications, including some equipment for workpiece manipulation and the development of flexible production systems for welding, surface treatment and automated assembly. The production itself of prototypes and test runs of machines, equipment and production systems developed in the association constitutes the third phase of the program, and encompasses also delivery and service issues.

In the intergovernmental agreement that has been signed the CSSR and the USSR commit themselves to developing all the necessary material, financial and other conditions as specified in detail in special sections of the relevant annual and 5-year plans of both countries. The association "ROBOT" occupies an important position in this regard because its framework can be used to bring together all of the most important components of the capital replacement process in this progressive field.

The fulfillment of the program, the operative resolution of basic questions of cooperation in definite fields, and other related issues are under the authority of the Council of Delegates, which is composed of representatives of the pertinent agencies of both contracting parties. For the CSSR the head of this agency is the representative of the State Commission for R&D and Investment Development, while the Soviet side is headed by the representative of the State Committee of the USSR for R&D. Each representative has a single vote on the Council of Delegates. The main tasks of this agency include the following:

--The discussion and resolution of economic, technical, organizational, legal and other issues related to the implementation of the agreement and the program and which require decisions by the relevant agencies in the CSSR and the USSR;

--Specifying the program in necessary instances that do not concern the basic objectives of cooperation;

--The evaluation of information from representatives of agencies and organizations responsible for program fulfillment and the commitments contained in the agreement;

--The preparation of recommendations regarding the establishment of direct relations among enterprises and organizations of the contracting parties within the context of the agreed upon program;

--The discussion of other important issues related to the fulfillment of the program.

The Council of Delegates meets as necessary, but at least once a year, with meetings alternating on the territory of each of the contracting countries. Council resolutions are binding upon ratification by the agencies of the CSSR and the USSR and take effect upon the signing of a protocol of a plenum of the Council, as long as the resolution does not specify otherwise. During the time between plenums the Council of Delegates may resolve individual problems in working sessions upon agreement of the representatives of both countries.

The individual members of the association are appointed by the proper agencies of the CSSR and the USSR. The Czech side is represented by organizations from the Federal Ministry of General Engineering [FMVS] (Presov Research Institute of the Metals Industry [VUKOV], the Prague Factories for Engineering Machinery [TST] economic production unit, the Martin Heavy Engineering Plants [ZTS] economic production unit, and the Bratislava Strojsmalt economic production unit), the Federal Ministry of Metallurgy and Heavy Engineering [FMHTS] (the Brno CHEPOS economic production unit, the Ostrava Vitkovice VHJ) and the Federal Ministry of the Electrotechnical Industry [FMEP] (the Prague Automation and Computer Technology Plants [ZAVT] VHJ, the Prague High-Voltage Electrical Engineering Plants [ZSE] VHJ, the Prague Tesla--Investment Electronics VHJ, and the Nove Mesto nad Vahom Research Institute of Mechanization and Automation). These members of the "ROBOT" association contribute to its activities in agreed upon facilities. The participation is also assumed of facilities of the Czechoslovak Academy of Sciences [CSAV] and the Slovak Academy of Sciences [SAV] and of the Ministries of Education of the CSR and SSR in the R&D work for specific systems. The State Commission for R&D and

Investment Development oversees the running of the committee of the association, and the link between the association and the Czechoslovak national economic plan is handled by the State Planning Commission.

This year 120 employees will be active in the international R&D association "ROBOT" approximately one-third of which will be from the USSR. The association can set up branch offices and staffs in the CSSR and the USSR after agreements with the appropriate agencies in each country. The possibility also exists of setting up such branches on the territory of third countries in accordance with the legal requirements of the host countries, with association branches being legal entities of the countries where they are located, with the exception of the CSSR, where representative offices are not accorded such legal status. "ROBOT" has offices in Moscow and in Prague. Details of the organizational structure and chain of command are provided in Figure 1.

Management System

Khozraschot is the basic principle of management of the international R&D association "ROBOT." When it was founded this association was granted a statutory fund in the amount of 10 million convertible rubles. If necessary this fund may be increased by 50 percent of this amount by a decision of the Council of Delegates. The CSSR and USSR contribute equally to this fund. If the revenues from the economic activities of "ROBOT" do not cover its expenditures the members of the association will replace the resources that are lacking in the form of supplementary contributions in accordance with the principles for the formation of the statutory fund. The amount of these contributions will be fixed by the appropriate financial plans.

The output of "ROBOT" is determined in accordance with the annual plans for its major tasks. At the beginning administrative, R&D and design activities should predominate, which means that production will gather speed only in later years. In the area of R&D the contributions of cooperation will be evident mainly in savings on engineering work on the basis of greater unification and an overlap of about 30 percent in the stages of R&D. Another important contribution is the concentration of problem solving expertise for the jointly developed modules of industrial robots and manipulators, which allows a shortening of the research-development cycle by 18-24 months. Also important are the planned savings once production gets under way. These should be very evident in the pertinent financial indicators (output, profits). Another potentially positive factor in this regard is a higher differential indicator achieved on the basis of comprehensive deliveries of robotized equipment complexes. According to plan projections by the end of the Eighth 5-Year Plan the association should be generating about Kcs 400 million of revenues.

The unification and standardization of parts, components and modules at the same time makes possible the aggregation of production along with the utilization of advanced production technologies, increased labor productivity, cost reductions on the order of 20-40 percent, and an increase in technico-economic sophistication, all of which will be evident in higher quality and reliability of the pertinent systems. In terms of users, costs on engineering and design preparations should be reduced by about 75 percent, which in the near future will amount to savings of about Kcs 150 million.

41. Production
42. Delivery
43. Service
44. CAD/CAM
45. User

An optimized and more efficient structure for robotics complexes is being achieved by standardizing the equipment used for operational manipulation and its modules. This should result in a reduction of one-time costs at the design stage that will carry over to implementation as well. The standardization of designs and equipment for operational manipulation should allow a reduction of one-time costs of 10-30 percent, and thereby to a corresponding increase in efficiency and increased sales to end users. The installation of robotized equipment results in relative savings of 1.5 to 3 employees per installation of industrial robot and manipulator and in other cost savings. It is anticipated that total savings from the work of "ROBOT" should amount to more than Kcs 800 million between 1985-1990.

It must also be expected that the direct activities of the association will have a positive impact on the development of cooperative production and specialization in related sectors and thereby contribute to an increase in the volume of foreign trade. The specific consequences in this area will become evident after clarifying pricing issues and the levels of the pertinent deliveries. "ROBOT" has been empowered to engage in foreign trade related to the work specified in the program. Foreign trade relationships with Soviet organizations are implemented through the foreign trade organization "Vneshtekhnika," and those with other countries in accordance with the legal codes of those countries.

Accounting for materials, raw materials, other items and services performed for the actual production-managerial functioning of the association and its branches by organizations in the CSSR or in other countries where the branches are located is made in korunas or in the national currency of the location of the branch in question. Accounting for deliveries of goods from the USSR is made in convertible rubles and in prices established in accordance with the principles of price formation applicable to trade among CEMA member countries.

Amounts in convertible rubles and hard currencies obtained by the association from the sale of the output from its R&D, design-engineering and other activities are fully attributable to the foreign currency accounts of "ROBOT" and its branches. A portion of these revenues, in an amount set by the council of the association, may be used to purchase equipment, materials, technical documentation, licenses, know-how, and to cover other expenditures. These foreign currency accounts are to be opened in the country where the branch is located.

Material property imported by members of the association as contributory shipments to the territory of any of the partner countries are free of duty payments, taxes, and transfers. In the CSSR and the USSR the association and its branches are:

--Exempt from duty payments and other limitations on importing or exporting goods designated for "ROBOT" operations;

--Authorized to take advantage of all discounts and advantages offered by pertinent state economic organizations and enterprises.

Until such time as "ROBOT" and its branches in the CSSR and the USSR become profitable, such branches are exempt in the countries of their location from all direct taxes and transfers from profits and payments to both national and local entities, with the exception of payments for public and other services. After it has become profitable, payment of taxes, including taxes on profits of the association, will be clarified by supplementary agreements between the pertinent agencies of the CSSR and the USSR.

Participation in the distribution of profits among the member organizations in "ROBOT" will be proportional to shares in the formation of the initial statutory fund. Profits distributed among the member agencies in the association may be used to procure goods in the CSSR or may be transferred to the USSR. Hard currency revenues remaining in bank accounts at the end of the year will be distributed among "ROBOT" members in equal shares against comparable compensation in transferrable rubles. Profits will be used to subsidize association funds, including in particular the fund for social and cultural requirements, the bonus fund, and the contingency fund.

All conversions related to the administration and economic activities of "ROBOT," its branches and representative offices, from the respective national currencies to convertible rubles and the other way around, will be made on the basis of individual negotiations between the authorized agencies of the countries concerned. The conversion of hard currencies to convertible rubles will be according to exchange rates as regularly set by the International Bank for Economic Cooperation in Moscow.

Conclusion

The establishment of the international R&D association "ROBOT" is one of the first specific cases of the implementation of the resolutions of the executive level economic conference of the CEMA member countries in June 1984. Its experience has shown that the development of direct relationships between interested agencies and organizations of the member countries requires the creation of the necessary preconditions in the national systems of planning and management. In the same vein the task of resolving gradually the complex questions of the merging of all these systems, especially in the area of cooperation in foreign trade, has become correspondingly more important.

In developing the preconditions for the establishment of this association considerable use was made of the experiences already gained in the establishment of previous international economic organizations. Current findings related to recent R&D work in the field of robotics were also analyzed very closely, including the activities of the joint Czechoslovak-Soviet design, engineering and technical office Robot, which is being merged into the newly created association. The example of "ROBOT" confirms that given substantial mutual interest and a concentration of the efforts of all participating countries and entities, it is possible gradually to develop specific forms of direct relations within the framework of the CEMA, with the objective of contributing to the introduction of intensive factors in the economic growth of the participating socialist economies.

PROBLEMS OF DEVELOPING PERSONNEL FOR ROBOTIZATION PROGRAM VIEWED

Prague PODNIKOVA ORGANIZACE in Czech No 9, 1985 pp 389-395

[Article by Docent Eng Zdenek Drab, candidate for doctor of science, Eng Vladimir Pernica, and Docent Eng Zbynek Pitra, candidate for doctor of science: "Training Personnel for Development of Robotization"]

[Text] 1. Introduction

The robotization program for our national economy is an exceptionally complex, extensive, materially and organizationally time-consuming and, above all, politically demanding task in that it gradually--directly and indirectly--has an impact on the lives of all of our citizens. Moreover, it is without precedent in the entire history of automation in this country. So far the actual introduction of robots in specific sectors of the economy (mainly in our key sector--engineering) has been haphazard and unsystematic; this has resulted in slower than projected progress in robotization, low efficiency of those installations that have been made, and in low levels of employee acceptance for this equipment. Experiences from the introduction of robots in other industrially advanced countries show clearly that professional training plays a critical role in the successful introduction of robots.

As part of the long-term program for robotizing our economy the Ministry of Education has been developing, in conjunction with other sectors, a model for the training of skilled blue collar workers, middle rank professional, and field engineering personnel. The objective of this article is to help to clarify this complex issue because of its highly systemic character. One of the main criteria for establishing the numbers and qualifications of personnel (as well as the scope and nature of retraining programs) is the classifications of worksites outfitted with industrial robots and manipulators [PRaM]. These classifications must be systematic. The engineering sector, which is the focal point of the application potential for PRaM, is treated in detail in another part of this article.

A third section is devoted to the design of a model for personnel training to meet the requirements of the robotization of our economy. One of the considerations in the development of this model is to evaluate the current means of training experts for robotization in specific school-based and in-service training programs, as well as evaluating existing conceptions for courses of study and programs that will provide a framework for training in the future. Also important is the question of coordinating personnel preparation in the CSR and SSR among different training institutions (ministries, VHJ and enterprises, the Czechoslovak Science and Technological Society [CSVTS], as well as other public organizations).

Mainly thanks to the mass media robotization is viewed in this country in various contexts and ways. The greatest lack is of an emphasis on close cooperation between robotics and so-called flexible automation, which makes it possible to automate both piece and small run production. That is why a special article has been devoted to this topic.

2. Classification of Worksites Outfitted With PRaM

Current utilization of industrial robots and manipulators [PRaM] is still largely on an experimental basis in the CSSR, despite some successes and a relatively large number of automated equipment workstations [ATP]. When developing the classification of robotized workstations it was necessary to make use of existing information concerning the robotization process that was available in both foreign and domestic literature. There is also the issue of reaching a unified concept of an ATP. For instance, data of the former Federal Ministry of Technical and Investment Development showed that certain sectors reported far more PRaM than ATP, while other sectors reported the same numbers of PRaM and ATP.

The foundation for classifying robotized workstations is the technical classification of PRaM in conjunction with the classification of the given production operation. Technically, it is possible to classify PRaM according to characteristics that differentiate their construction and, therefore, the number of potential uses. The basic modification in the potential uses of a given robot depend mainly on the characteristics of its control system--in this area we have available both relatively rigid, mechanically programmed equipment and relatively flexible, software programmable equipment. When one speaks of robot generations, the main differentiating feature is the sophistication of the control system. The first generation was controlled mainly by mechanical programs, the second generation by digitally programmable equipment or a computer program, while third and higher generation machines are controlled by computer programs as well as being outfitted with sensors for detecting environmental conditions and possessing the ability to adapt to external conditions (and the ability to teach itself).

By their designated use, PRaM represent a higher degree of automation of the capital replacement process leading to further replacement of the more complex and logical functions of humans. Robotization links automated information processing with automated material processing procedures. The link between a production technology and the jobs filled by people are the work operations. The characteristics of these production operations are, in turn, reflected in requirements for specific types of PRaM with specific control systems. The production process consists of material transformations implemented by production operations of the following types:

--Machining and forming which include chip machining, forging, stamping and casting;

--Surface treatments and heat processing, including painting, plating, coating, and heat treatment;

--Assembly, which includes welding, riveting, gluing, press-fitting, hooking up electrical conductors, winding, mechanical assembly;

--Packaging, which includes picking, packing, storing, and crating.

Robotized worksites utilize PRaM to 1) perform production operations automatically and 2) to automate service activities, most frequently the automation of the flow of materials and subassemblies.

2.1. ATP Classification

The classification of ATP types is based on a link between the classification of production activities and the most commonly utilized types of machines at industrial plants. These include chip machine tools (traditional, numerically controlled, computer numerically controlled and direct numerically controlled), presses of all types and designations, forges and casting machinery, atmospheric, pressure, and centrifugal equipment, both point and arc welders, riveting equipment, etc. Also to be included here were the known results of current trends in the development of automated production. Finally, it is necessary to take into consideration socially desirable changes in the content and nature of work that would support the development of the personalities of individual workers. In conjunction with this it is possible to divide ATP into the six basic types described in Table 1.

Table 1. Classification of Robotized Work Stations

ATP-1	A work station with a single machine tool (forming and other types of tools as well) functionally linked with 1-2 PRaM, with the unit controlled by digitally programmed equipment (CPZ) or a computer (program);
ATP-1a	A work station with a single piece of equipment for assembling (welding, wiring, etc.), surface treatment (coating, hardening, etc.), or for packing, with automated material or component handling by 1-2 PRaM. The unit is controlled by a CPZ or computer;
ATP-2	A work station with 2-3 machine (forming) tools and 3-6 servicing robots in a consolidated and flexible production division with automated delivery and movement of material, automated delivery and exchange of tools, and automated control of the resultant product. The unit is controlled by a computer, and possibly by other, local CPZ;
ATP-2a	An automated assembly line (or line for surface treatments, wiring, hardening, packing, etc.) with 3 or more PRaM in either universal or special purpose configuration;

ATP-3	A flexible production division comprised of a set of differing operations performed on materials (machining, forming, welding, riveting, surface treatments, etc.), and in some cases multiple transformations with more than 3 machines for basic functions and five PRaM, with automated delivery and internal movement of materials, tools and the automated control of the final product. The unit is controlled by one or more computers;
ATP-4	An automated production division for operating on materials with more basic function machines and PRaM, with automated material placement, semifinished goods, and component placement, automated assembly of final products, product inspection and testing, and automated packing. The unit is controlled by one or more computers.

2.2. The Work and the Workers at ATP

Automated production demands, in contrast to traditional production operations, the expenditure of labor in a modified form and in different amounts. Studies to date make it possible to state that the following tasks must be performed at robotized work stations equipped with ATP:

1) The setting up, feeding and monitoring of machine operation (machine activities);

2) Tool preparation and preparations for machine operations;

3) Delivery and removal of material (in addition to machine movements);

4) Setting up and monitoring the operations of PRaM and transporting equipment;

5) Writing programs for the machine and PRaM control systems (including program media);

6) Maintenance and debugging of programs;

7) Monitoring electronic control and computing equipment;

8) Monitoring the results of the production process (measuring and testing) and the setting up and programming of automated control equipment;

9) Maintenance and repair of basic machinery (e.g., machine tools);

10) Maintenance and repair of PRaM;

11) Field maintenance and repair of control systems.

Of this set of work activities the final three are only indirectly connected with ATP operation and may be designated as relatively independent; the first eight activities represent servicing work on ATP and are therefore the basis for their specialization. In terms of job qualifications the following suggest themselves:

a) A specialization for each of the above eight activities. This solution is not effective because it would require an unacceptably high number of service workers, complicated professional training, and is in conflict with the objective trends and the long-range social objective of developing the personalities of the workers;

b) A universal employee who would be responsible for all eight activities. This solution, to be sure, appears quite forward looking, but is as a practical matter not implementable on a wide scale within the production base; it should be feasible, on the other hand, in exceptional laboratory or experimental conditions;

c) A broadly trained professional capable of performing a certain number of related tasks (both professional and auxiliary) at ATP. This would require selecting a number of appropriate combinations of tasks from the above set of eight. For example: an operator of NC machines and PRaM could be trained to perform tasks 1, 2, 4, and 8, and a programmer for NC machines and PRaM could be trained to perform tasks 5, 6, and 7.

In the entire set of work activities there remains the auxiliary activity No 3, which may be performed as a supplementary activity by an operator.

2.3. A Model for Classifying Workers for Robotized Work Stations

Experiences to date with the introduction and utilization of PRaM indicate that the setting up of individual work stations with PRaM does not as a rule lead to a substantial increase in the quality of the production process or to more favorable economic results. For the same reason, ATP with a single PRaM and a single machine tool (ATP-1 in our classification) do not represent a typical work site, but rather an exceptional work site, more frequently an experimental or testing station. For this type of work site it is necessary to set up organizational and qualificational guidelines as well as wage scales on a case by case basis, with a tendency toward approximating the conditions of research facilities.

We will instead consider ATP-2 type facilities to be typical and have set up a list of job descriptions for one, shown in Table 2. This job list assumes that there are two basic (e.g., machine) tools. In Table 3 the list for ATP-3 has an additional operator for each additional basic machine; as an example of a more complex ATP, take 6 basic machines and 10 PRaM. This will require a minimum of 7 + 4 + 12 = 27 employees, 8 of whom will need a college and 19 of whom will need a secondary professional education, as in Table 4.

This proposed model is based on existing mechanisms for an economic evaluation of work. Such an approach is essential at the current level of robotization, which may be characterized as a traditional phase. The model for the staffing of ATP and the economic relationships expressed in the job descriptions and wage scales take into account both the statistically determined average blue collar wage in Czechoslovakia as well as the current economic situation.

Table 2. Job Categories for ATP-2 and ATP-2a

Job No.	Description and No.		Education	Experience	Wage category/ Wage scale
1	Machine operator	2	Secondary professional with diploma	2 years or more	D 5-9/.-8
1	Tool operator	1	Same	Same	Same
3	Control operator	1	Same	Same	Same
4	Transport operator	1	Same	Same	Same
5	Operator of insertion/extraction equipment	1	Same	Same	Same
6	Programmer	1	Same	Same	Same
7	Assistant foreman	1	College	Entry	T 10/IIa
8	Foreman	1	College	4 years or more	T 12/IIIc

Total 9 employees, 2 with college degrees, 7 with secondary professional school training and diplomas

Table 3. Job Categories for ATP-3

Job No.	Description and No.		Education	Experience	Wage category/ Wage scale
1	Controller	1	Secondary professional with diploma	4 or more years	D 5-9/6-8
2	Basic machine and PRaM technician	1	5-year diploma	4 years	Same
3	Computer system technician	1	Same	Same	Same
4	Systems programmer	1	College	4 or more years	T 12/IIIc
5	Assistant foreman	1	College	None	T 10/IIa
6	Foreman	1	College	5 or more years	T 13/IIIc

Total for 4 basic machines: 15 employees, 3 with college, 12 with secondary professional with diploma

Table 4. Job Categories for ATP-4

Job No.	Description and No.		Education	Experience	Wage category/ Wage scale
1	Technology manager	1	College	4 or more years	T 12/IV
2	Technologist (as needed and based on number of technologies)	1 or more	Secondary professional	4 or more years	D 6-9/7-9
3	Assembly foreman	1	College	Same	T 12/IV
4	Assembly technologist	1 or more	Secondary professional	Same	D -9/7-9
5	Chief controller	1	College	Same	T 12/IV
6	Machine technician	1	Secondary professional	Same	D 6-9/7-9
7	PRaM technician	1	Same	Same	D 6-9/7-9
8	Computer technician	1	College	Same	T 12/IV
9	Planner	1	Secondary professional	Same	T 10/IV
10	System programmer	1	College	Same	T 14/IV
11	Assistant foreman	1	Same	None	T 10/IIa
12	Co-foreman	1 or more	Same	4 or more years	T 13/IV
13	Foreman	1	Same	6 or more years	T 15/IV

In the immediate future we will not have available enough individuals with a secondary professional or college education to fill the positions of foremen. For this reason considerable latitude exists for the choice of wage scales. We can get through this transitional phase with the resources available at each workplace while at the same time creating the opportunity for fairly evaluating the experiences and abilities of those blue collar workers who have been working for a long time at these facilities and who will in the future be staffing ATP.

The model is currently plagued by a number of shortcomings in the current wage system. It may be expected that the automation of consolidated production divisions needed to facilitate robotization will bring with it some new problems. These problems will be evident in worker relations and it is almost impossible to reflect them in wage regulations. Furthermore the impact on the system of individual workers is immediate and has a more profound effect on the performance and duties of a given production division. The economic relationships between the workers in a given ATP as expressed by their wage rates is a very approximate model, the adjustment of which is most feasible within each given ATP.

The ATP is charged with developing an appropriate technical base for implementing team forms of work organization and compensation. The ATP staff, particularly the foremen grouped as a team, can resolve many of the problems involved in the uninterrupted operation of ATP and assist in the correct evaluation of the contribution of each and every worker to overall performance. The relatively high educational level for ATP staff that is presupposed in this model holds the promise for further democratizing management, for facilitating work-related and other worker initiatives, and for the participation of everyone in management. We consider the model to be appropriate for our current situation at the level of the production base. After we have achieved the level of robotization projected by the Eighth 5-Year Plan and our long-range program, and when we will also have available more graduates from training schools with diplomas, it will be necessary to rethink the model for the period after 1995.

3. Staff Training Model for Robotization

In developing a program for the training of staff for the robotization of our national economy we have followed these principles:

--Staff training for robotization will be conceived of in the broader context of staff training for the automation of our entire economy;

--This training strategy must be directly derived from the strategy for the installation of PRaM and the quantitative and qualitative needs of the completion of comprehensive automation;

--The training program will not be confined strictly to technical subjects but will also incorporate necessary economic and social aspects of automation related to the installation of robots and the presentation of this program to the general public;

--This model will be formed on the basis of the existing structure for school-based and in-service training, meaning that the balance of the training for automation will consist of modifying the content of existing courses at colleges and secondary schools;

--A part of the model will define the peripheral conditions for its realization, especially staffing and material needs (i.e., teacher qualifications for specific aspects of the training, the necessary equipment for laboratories and workshops, coordinating the printing of textbooks, etc.), as well as the clarification of the reasons for introducing robots in specific instances in given sectors of the economy.

3.1. Approach to Model Development

To assure that the necessary staff will be produced to carry out the robotization program we must put the finishing touches to and make fully operational a training system for blue collar, technical, and engineering professions--the objective of this program is to prepare a model for training staff for robotization and propose measures that will facilitate its gradual implementation. This is a complicated set of issues of a systemic character, the resolution of which requires the work of teams. It was therefore necessary to set up a problem solving team composed of the pertinent specialists, establish work methods and set up a schedule for the completion of this work. Attention was devoted mainly to gaining a consensus of views on an outline of the model which, based on the documentary evidence to be obtained from cooperating institutes, will have to be gradually filled out and made more precise.

3.2. Main Considerations for Establishing Training Model

The main considerations for establishing this model were:

--Time: Stage 1, a transitional period from 1984-1986; stage 2, model implementation between 1986-1990; stage 3, projection for the year 1990;

--Quality: 1) The classification of ATP and automated production systems [AVS] outfitted with PRaM based on their technological objective, their sophistication, size and complexity and the requisite job descriptions for their operation and maintenance. The study, Classification of Worksites Outfitted with PRaM, cited in section 2 was made for this purpose; 2) the means for the selection, training and placement of workers for a) the maintenance and operation of robotized worksites; b) for the organizations involved in the design of robotized workplaces; c) for the research, development, design, preproduction preparations, production, assembly and installation of PRaM and their components; and d) for other workplaces that are involved in robotization (managerial offices, consulting firms, training centers, etc.), including the economic and social aspects of robotization;

--Quantity: This is mainly a matter of the data gained both from the program of installing PRaM in specific sectors and branches of the national economy and from the qualificational requirements set for employees in robotization, as these are set forth in the preceding section (in three areas: ASV and ATP operations; the design of robotized workplaces; the research, development and production of PRaM and their components). Based on these needs for skilled blue collar, technical and engineering employees it is possible, based on an appropriate program of training and education, to establish the requirements for their training based on the time requirements for implementing the PRaM program in our economy. An important part of these requirements is the support and retraining of workers displaced under this program;

--Resources: 1) Qualitative: Lists of graduates of existing or anticipated training programs at secondary professional training centers, secondary professional schools, post-diploma programs, colleges, postgraduate study and scientific training courses given by specific sectoral and enterprise institutes, Czechoslovak Society for Science and Technology courses, and other forms of study (study trips abroad, etc.). 2) Quantitative: This mainly involves counting the trainable professionals by specialization, required level of sophistication and years in existing or projected training facilities, both school and non-school related;

--Comparison of Data and Requirements: A comparison of the quantitative and qualitative aspects of requirements and their attainability makes it possible to propose the necessary measures for implementing the model of a training program for personnel to meet the needs of our economy;

--Economic: This involves the obtaining of at least an approximation of the costs to be incurred in implementing the model and the expected economic and social efficiency of its operation.

3.3. Proposed Model for Training Skilled Blue Collar Workers, Middle Professional and Engineering-Technical Staff To Assure the Robotization Program

The proposed model is based on current conceptions of the incorporation of the CSSR, as an industrially advanced country, in the process of robotization of production techniques. In this regard, the training of specialists for robotization will call upon the expertise of various organizations:

--The training of researchers is best performed at selected CSAV facilities and colleges;

--The training of engineers specializing in robot development, the design of robotized worksites and integrated, computer controlled production (CAD, CAP, CAM, CAT) is best undertaken by the faculties of engineering colleges, and especially by those involved in the training of mechanical and electrotechnical engineers both at the undergraduate and the postgraduate level;

--Employees involved in the design and especially the operation of automated workstations equipped with PRaM are best trained by the end users;

--General training for the introduction of PRaM is the responsibility of the Czechoslovak Scientific and Technical Society, the courses of which offer rapid and effective information for the managerial and engineering-technical employees of those organizations where the building of robotized workstations is planned for the near future;

--For employees involved in service and operations it is expected that most of the training will take place as part of comprehensive deliveries (as is the case with computers) by the suppliers of the PRaM.

3.4. Model for Training Professionals at Professional and Secondary Schools

Current analyses of the system of study programs for the training of youth for blue collar jobs indicates that in the future it will not be necessary to make any basic changes in the nomenclature of these programs. It will be necessary, however, to update the subject matter taught in these programs. It is becoming increasingly important to improve training in the area of automation, robotization, electronics, and computer technology. It has been shown that it is essential that students, especially those from fields in engineering, the electrotechnical, chemical and petrochemical industries, as well as those from most areas of processing industries, master the basic information and findings, as well as obtain practical experience in the application of PRaM, to production processes.

A listing of the measures intended to facilitate the introduction of training in microelectronics, computer technology, and robotics for the training of young people for blue collar occupations is not possible given the constraints on this article. Changes necessitated by R&D in education have all for the most part already been included in curriculums. Background requirements and required courses have been arrived at in close cooperation with those sectors for whom the students are receiving training. In conjunction with the introduction of the subject of robotics into secondary school curricula teachers must be trained as well. Such training can be best provided within the context of the professional-innovational part of the training, the focus of which should be the use of PRaM in production processes.

3.5. Model of Training at Colleges

The pressure to increase productivity and the quality of production is the motivation for the growing attention being paid to the use of automated production equipment, a classification within which industrial manipulators and robots are an increasingly important part. Automation is making continual inroads where there is monotonous work or where work takes place in a hazardous environment. The process of training experts in this newly developing field known as robotics has been undertaken mainly by the engineering department of the Czechoslovak Technical Institute [CVUT] in Prague within the context of the multidisciplinary study, Industrial Manipulators and Robots. This program has already become a part of the curriculum for years 4 and 5--this curriculum is listed in Table 5. The objective of the program is to train engineer-specialists in the area of PRaM with the emphasis on design and operation. The study emphasizes primarily the comprehensiveness of automation, links between individual automated resources, and an optimizing approach to the whole issue. Graduates find jobs in all areas of engineering and non-engineering production, where they work as designers, design engineers and developmental employees for automated production units outfitted with PRaM. At the electrotechnical department of the CVUT in Prague a concentration called Robotics has been introduced within the curriculum Technical Cybernetics. There is a similar major at the electrotechnical department of the VUT in Brno. At the engineering department of the Technical College in Kosice there is an interdisciplinary program called Robotics Technology that concentrates mainly on the design of automated production systems with PRaM.

A further step is providing for training in automation in the remaining and related fields. Automating production in turn has an impact on the preproduction phase, which must also have at its disposal properly qualified personnel. The structure and workings of produced parts and entire systems must also be subordinated to production automation. With this in mind it is necessary to augment curricula in basic programs, and in some specialized ones as well, with the following courses: 1) the automation and robotization of technical procedures; 2) design techniques related to automated production; 3) engineering techniques related to automated production; 4) techniques for automated production; 5) organization and economics of automated production.

Table 5. Interdisciplinary College Curriculum for PRaM

	Winter semester	Summer semester
Year 4		
Scientific communism	1+2 z	1+2 z, zk
Construction of production machines	4+1 z, zk	4+0 zk
Mechanizing and automating production machines	4+0 zk	2+0 zk
Pneumatic and hydraulic mechanisms	3+1 z, zk	--
Electric measurement of nonelectric magnitudes	1+2 zk	--
Construction techniques and hands-on construction training	2+6 kz	0+6 kz
Special techniques	2+1 z, zk	--
Mechanical manipulating equipment	--	3+2 z, zk
Theory of automated machines	--	3+1 z, zk
Laboratory work with mechanisms	--	0+4 z
Fundamentals of computer technology	--	1+1 z
Field trip	--	1 week
Total number of hours weekly	17+13	14+16
Number of exams	4	5
Military training	6 hours	6 hours
Year 5		
Servomechanisms	2+1 z, zk	--
Automated management systems	3+0 z, zk	--
Production systems for large-scale production and assembly	4+1 z, zk	--
Electrotechnical production equipment	3+2 z, zk	--
Design training	0+4 kz	--
Lab work with control systems	0+4 z	--
Industrial handlers and robots	4+0 zk	2+0 zk
Computer managed engineering output	2+0 z	2+5 z, zk
Mathematical-logical modelling	--	2+1 z, zk
Electronics	--	3+2 z, zk
Design and installation of automated system with robot	--	2+1 z, zk
Final design	--	0+10 kz
Total hours per week	18+12	11+19
Number of examinations	5	5

Subjects of final state examinations:

1. Marxism-Leninism
2. Mechanics
3. Mechanization and automation of production machinery
4. Fundamentals of construction of production machinery

No less important is the role of the colleges in increasing the qualifications of current employees or retraining people from other fields. To further this objective a postgraduate curriculum has been introduced entitled "Industrial Manipulators and Robots," the courses for which are listed in Table 6. At the same time it is essential to pay increased attention to the coordination of individual offerings of postgraduate courses with the latest findings of R&D and practical experience. In conjunction with this hands-on approach to postgraduate training it is essential to provide all necessary preconditions so that enough such courses may be organized to fill planned requirements for experts in these areas. The program is completed with an independent project related both to problem solving for PRaM, but also entire robotized worksites.

Table 6. Curriculum for Postgraduate Course in PRaM

	Lecture	Concentration
Social science subject	10	
Mechanization and automation of production processes	16	
Engineering fundamentals of production machines at automated worksites (production and assembly lines, etc.)	16	
Automated production techniques	16	
Engineering of manipulators and industrial robots	24	
Operation of manipulators and industrial robots	16	
Hydraulic and pneumatic mechanisms	12	
Servomechanisms	12	4
Electrotechnical fundamentals for handling equipment	12	
Theory of automated machinery	10	4
Mathematical-logical modelling	10	4
Fundamentals of automated control	16	
Design methodology for automated production equipment using manipulators and robots	8	5
Laboratory work and concentration	60	5
Final project	160	

Total classroom hours: 275
Final project: 160

3.6. Other Forms of Personnel Training

In addition to both types of college programs--undergraduate and postgraduate--it is also necessary to support those college teachers who handle the training of groups of workers within the context of the Czechoslovak Scientific and Technical Society and at enterprise or sectoral institutions. This is normally a matter of specialized courses and seminars designed for technical employees with a secondary level or college education and who are dealing with the issues of production automation within their own enterprises. The objective of these programs is the upgrading of knowledge in the field of robotics, primarily from the viewpoint of the operation of handling equipment and the engineering of single purpose manipulators and auxiliary manipulating equipment adapted to a given application. Such courses are usually organized to cover two semesters with a required final project. Training in Slovakia for engineers and technicians and the upgrading of their skills proceeds in the same manner as in the Czech lands. Basic information about robotics, its objectives, potential and limitations is provided in varying, usually 5-day courses offered at training centers of the Technology Houses of the Czechoslovak Scientific and Technical Society.

3.7. Potential for Applying "Module Approach" to Training of Experts for the Robotization of Our Economy

The application of a "module principle" is based on the utilization of a systemic approach and takes account both of the comprehensive nature of robotization and its rapid pace of innovation. It also takes account of the actual conditions and potential for staffing and material preparedness of our colleges to train personnel in the field of robotics (the author of this module approach is Prof Eng J. Buda, doctor of science, dean of the engineering department at the Kosice Technical College). The field of robotization, under this approach, is divided into about 80 study modules, with each module taking about 10-20 hours to complete (lectures, exercises, laboratory exercises, and semester projects). In addition these modules are classified as 1) basic (general definitions, classifications, origins, developmental trends, etc.), 2) universal (possibility for use in curricula for teaching innovation), and 3) special (designated for specific specialities depending on the position of the graduate). An overview of the proposed organization of the modules is presented in Table 7. Based on this module approach it is possible to develop a highly flexible and efficient system for training experts in robotization at different levels, as shown in Table 8.

Table 7. Proposed Grouping of Thematic Units for Module Teaching of Robotics (Z--basic; U--universal; S--special)

1. Theoretical Basis

1.	Discrete mathematics	Z
2.	Mathematical programming	U
3.	Algorithm and resolution theory	U
4.	Heuristic methods	U
5.	Systemology	Z
6.	Theory of hierarchic systems	U
7.	Information theory	U
8.	Information structures	U
9.	Modelling theory	U
10.	Character models and formal languages	U
11.	Regulation theory	U
12.	Automated control theory	U

24.	Robot and manipulator design	S
25.	Peripheral equipment design	S

4. Programming

1.	Program typology for robotics	Z
2.	Machine languages, assemblers and macroassemblers	U
3.	Universal programming languages	U
4.	Languages for production machines and measurement equipment	U
5.	Simulation languages and systems	U
6.	CAD system programming	S
7.	Languages for industrial robots	U
8.	Artificial intelligence languages	U
9.	Databases	U
10.	Control unit operating systems and processors	S
11.	Operating systems for robotics complexes	S
12.	Diagnostic programs	S
13.	Designing programs for engineering activities	S
14.	Designing programs for control	S
15.	Program testing	S

5. Design and Operation of Robotics Systems

1.	Typology of robotics technology	Z
2.	Design methodology	S
3.	Design documentation	S
4.	Analysis of workpieces and production conditions	U, S
5.	Technology for robotics systems	U, S
6.	Selecting production resources for robotics systems	U, S
7.	Robotics modules	U, S
8.	Robotics cells	U, S
9.	Robotics systems and lines	U, S
10.	Integrated production and fully automated plants	U
11.	CAD, CAM, CAE synthesis	U
12.	Human factor in robotics	U
13.	Work safety	U
14.	Reliability of robotics systems	U
15.	Electronics for robotics systems	U
16.	Testing robotics systems	S
17.	Operations management and organization	S
18.	Maintenance and upgrading	U
19.	Automated engineering	S
20.	Automated design	S

Table 8. Model of Modular Structure for Training Experts in Robotization
Z = basic modules; U = universal modules; S = special modules

Level	Fields of study	Subject classification	Innovative subjects	Robotics modules
1.	For all engineering fields	Basics of robotics - 5 modules (Z)	1-5 modules (Z, U)	5-10
2.	Fields of study in main applications of robotics (such as nonspecialized engineering techniques), Economics and management	Basics of robotics 5 modules (Z)	5-15 modules (U)	10-20
3.	Developing new disciplines, such as: operating robotics systems-automated management systems in robotics	Approx. 4 new subjects from basic, universal and special modules 15-25 (Z, U, S)	5-15 modules (U)	20-40
4.	Development of new fields of study 1. Robotics technology and integrated production 2. Robotics equipment 3. Control of robotics systems	Selection and grouping of about 80 modules: 60 of type Z and U, 20 of type S		about 80

4. Conclusion

The Eighth CPCZ Central Committee Plenum, held on 15 and 16 June 1983, set forth the main objectives of R&D for our national economy and, among other things, provided for a concentration of effort as well on the "development and utilization of industrial robots and manipulators and their broad application in the interest of reducing work, especially physically exhausting work and work in unhealthy environments." The fulfillment of these tasks is closely connected with the further development of comprehensive automation in all branches of the national economy. The necessary material and technical preconditions for this development are gradually being put in place, not only within the context of our economy, but also in terms of coordinated efforts by all the CEMA countries. In this regard it is appropriate to point out that the leaders of the CEMA in this regard are the USSR and GDR, with the development of comprehensive automation in the CSSR lagging somewhat behind. Among other reasons this state of affairs has resulted from a lack of trained personnel, who are essential for the successful implementation of this process.

Development trends of comprehensive automation and robotization of production processes involve demands on people that take the specific forms of the tasks of designer of an automated production system with PRaM, as well as in the task of the operators and users of this system. The fulfillment of both above-mentioned tasks requires from these individuals completely new knowledge and skills, different from those involved in the design and operation of other systems.

For this reason personnel must be specially trained to fulfill these objectives in a targeted, newly created system of personnel training which must include not only the training of new experts within the school system, but also a system for upgrading qualifications (and retraining) workers already in the field.

BANKERS, ENTERPRISE OFFICIALS DISCUSS CREDIT POLICY

Warsaw ZYCIE GOSPODARCZE in Polish No 1, 5 Jan 86 p 5

[Article by Marzena Kowalska: "Policy of Available Credit"]

[Text] The invitation to a discussion on the draft plans of documents that regulate the functioning of banks; i.e., on the main directions of credit policy and instructions for 1986, organized by Prof W. Baka, the recently appointed president of NBP, may be interpreted as having a specific relevance to the tradition of meetings between the government plenipotentiary for economic reform and consulting enterprise representatives. The group of enterprises is, to be sure, not as large since it is made up of 50 units and not 100. A part of these 50 enterprises are making their debut in the consultative meetings held by Prof Baka. However, "the discussion," stated its initiator in his conclusion, "turned out to be productive."

The bank-enterprise relationship is not, as we all know, the best. We hear talk about the excessive interference of banks in the internal affairs of the financial management of enterprises. Opinions on the functioning of the principle of "difficult money" are also varied.

On quite a few occasions, someone from among the consultants engaged in discussion in the columned hall of the URM [Office of the Council of Ministers] would complain about the shortcomings in the functioning of the bank apparatus and gaps in the substantive preparation. Similar, although somewhat weaker reservations were also voiced at the inaugural session of consultative enterprise representatives at which the NBP president presided. The bankers did not remain silent. In their opinion, excessive paternalism and the meanders associated with this in the financial management of enterprises relieve their clients of the burden of concern for self-financing which often expresses itself in an indifferent attitude toward bank recommendations. However, the discussion was not dominated by mutual complaints but attention was concentrated on seeking out the kinds of solutions that would facilitate the shaping of a partnership-like model of bank-enterprise relations.

The bank, which up to now has willingly and most frequently been treated as a savings institution, must finally become "the executor of efficiency," stated Prof Baka who opened the discussion. According to the NBP president this motto should entail the following principles: support for efficient enterprises, assistance in overcoming difficulties offered to active enterprises and the consistent elimination of inefficient units. The team for financially threatened enterprises, which has been active for only a short period of time and which controls the current state of candidates for bankruptcy, is to further this end.

However, such an institutional solution cannot replace a smoothly running bank apparatus, the coordination of sources of enterprise funding or properly formed relations between banks and state administration agencies. Particularly, this latter sphere, which has been ensnared in a web of informal relationships strengthened over the years, hinders, in the opinion of bankers, the establishment of partnership-like cooperation between operational departments and enterprises whereas the relationships which come into play here preclude the efficiency of the entire bank system.

The basic assumptions of both documents were presented by the NBP vice-president, L. Urbanowicz, who stressed that the most important direction of credit policy of the upcoming period will be the principle "credit--yes; tax relief--no", which in his opinion is the road to improved efficiency. The translation of this principle into a language of practice is supposed to signify easier access to developmental credit, credit for investments, interim and payment credit, and greater freedom in the enterprise management of funds. Among other things, a more flexible attitude toward the matter of so-called financial loose spots, whose appearance until recently automatically meant the reduction of credit allotted to an enterprise, is being envisaged. The new regulations are to eliminate this volatile point from bank-enterprise relations.

The requirements presented by banks with regard to an enterprise's own participation in financing operations are also proposed to be lower or rather more flexible. However, it was stressed frequently and emphatically that this does not signify the liberalization of credit policy. The credit plan does not foresee an abundance of funds--quite the contrary. A deficit of approximately 140 billion zlotys is assumed, "which," declared Prof Baka, "will not mean running away from crediting totally but should compel the channeling of funds there where their use may bring the greatest economic and efficiency results."

In general, the presented draft plans were met with a favorable assessment by both the enterprises and the bankers from regional departments. Praise was given to those solutions which would give preferential treatment to efficient enterprises. In the "Guidelines" draft plan, the promotion of developmental undertakings, which would enable production growth, especially export production growth, and the ushering in of technical progress and economizing measures is advocated. Increased credit amounts for enterprise investments, above all, for renewal and modernizing investments were also projected. More developmental credit and the extension of its repayment to 5 years is envisaged. These types of credit are to play a larger role than had been the case until now in promoting efficient undertakings. The credit amount will be connected to the growth of reserve funds arising from the expansion of enterprise activity and from price increases, and also to an enterprise's own funds.

A great deal of emphasis was placed on the prompt repayment of converted credit with the greater involvement of an enterprise's own funds. It is also assumed that credit for continuing needs should be systematically reduced depending on an enterprise's wealth in the developmental fund. Greater flexibility in approving credit for debts was projected. The possibility of granting this credit for periods longer than has been the case until now--even for as long as 1 year--is not being ruled out. This received the approval of both bankers and bank clients. It was not concealed that, in effect, this is the most sensitive instrument of exerting influence on an enterprise.

The "Guidelines" also envisage the granting of temporary credit assistance to efficiently run enterprises for the financing of needs arising from the necessity of accumulating short-term and economically substantiated reserves which cannot be financed with the already granted credit.

In sum, eight types of credit are to be accorded for operational activity. This number was accepted without any particular approval but rather as a necessary evil, rightly fearing greater work intensiveness both in NBP departments and in the enterprises themselves.

The formula, that bank credit in the field of investments should be used as an instrument of actively exerting influence on the structure and modernity of production and services while upholding as the main principle that credit can be granted up to 80 percent of the cost estimate value of an investment while the crediting period should not exceed 10 years, did not raise reservations. The credit amount, credit periods and also--according to some--the credit cost in the form of the interest rate should be differentiated depending on an enterprise's specific situation, the nature of the investment and its purpose.

Vice-president Urbanowicz stressed emphatically and frequently that in granting long-range credit assistance to enterprises that have credit ability and work to improve efficiency, operational departments should tighten the criteria for granting credit to inefficient enterprises. Units that have poor credit ability may receive credit on condition, and this should be reflected in the credit agreement, that they assume concrete activity that would bring about improved efficiency.

Approval was expressed for the entry which stated that a condition for the granting by banks of credit assistance to an enterprise threatened with bankruptcy should be, among other things, the maintaining by that enterprise of wage increases within limits which would not produce additional burdens in the form of a tax on above average wage payments as well as forgoing the paying out of rewards and bonuses from profits during the period of implementing the program of placing the enterprise on its feet again.

The comments and doubts that arose on the basis of the presented draft plans were varied in nature. Bank clients looked at things differently than those who will review credit recommendations, although, neither the former nor the latter voiced any substantial reservations.

The consultants, among whom were representatives of industry, small manufacturing businesses, and agricultural trade and services, praised both the greater clarity of the instructions and the guidelines as well as the simplifications in credit availability and, particularly, the possibility of obtaining credit for urgent payments. However, things did not go off without any "buts". This pertains to the reliability and accuracy of the assessment of the financial situation of an enterprise.

It was argued that the lame system of prices causes certain objectively justified undertakings presented in figures to appear inefficient. Profitability, treated by bankers as a symptom of current and prospective credit ability, takes on a deceptive appearance, especially there where rigid prices are binding. It was also not held back that despite simplifications in the availability of credit, the necessity of repayment from the developmental fund will continue to deter prospective clients. The state of the developmental fund under conditions of the instability of economic and financial solutions and the huge greediness of the budget is a big unknown. It was frankly stated that the taking on of credit to be repaid from profits is an act of courage. It is no wonder, therefore, that there are and will not be many of those willing to take such a risk--at least not until fiscal policy will be coordinated with credit policy into a single financial policy.

The term "prospective credit ability" gives rise to a lot of uncertainty. The question remains, "How does one measure it?" This was not the only question of a methodological nature. Many concepts and methods require more precise elaboration and improvement. Prof W. Baka called attention to this in summing up the discussion. This is particularly important at the threshold of the new year which the NBP president called the year of "strengthening the banking system."

The mode and procedure of conduct of banks toward the existing and arising organizational giants was referred as if to a blank spot in bank instructions. There are a lot of conflicts and misunderstandings in this sphere. It could be seen during the discussion that the banker's soul is rebelling in the face of a situation where the credit ability of a unit which is part of a partnership, business concern or some other giant is precluded by the fact that an enterprise as a whole possesses this credit capacity, although, if we take a closer look at the finances of subordinate units, this entire matter is not so unequivocal. These comments convinced the president who in his summation of the discussion announced that this vital issue would be included in the bank instructions. This would clear up the situation of bank departments which currently, in fact, fulfill an ornamental function.

The bankers also came out with the proposal, which was backed by the consultants, that investment credit within the framework of a pool controlled by an overseeing unit be granted to operational departments. In any case, this was one of many postulates of shifting a part of authority from higher rungs to a lower level; i.e., there where cooperation between the bank and the enterprise takes on a realistic shape and the awareness of needs is most complete.

Besides quite specific comments that cannot be considered secondary and which, for example, concern the manner and methods of the clearing of accounts, interest rates and repayment dead-lines, a proposal was voiced most frequently by bankers that greater significance be accorded to the cost of credit (variable interest rate) and to the conditions of repayment. Credit should become a parameter which as a result would better fulfill the motivational function. Credit cost and not its flow should influence the allocation of funds. The NBP president agreed with this viewpoint stating at the same time that under the current financial situation of many enterprises, this is more a proposal for the future than for implementation today.

'POLONIA' FIRMS EXPLAIN HARD CURRENCY EXPORT DROP

Warsaw ZYCIE GOSPODARCZE in Polish No 2, 12 Jan 86 p 14

[Article by E.M.: "'Polonia' Firms Want to Export"]

[Text] On 14 December of last year, a meeting was held at the Polania Society headquarters in Warsaw between a group of businessmen of Polish descent, who run enterprises in Poland, and journalists interested in the economic problem. Obviously, the topic of discussion was the activity and growth of "Polonia" firms. In the first phase of the discussion, it would appear that the owners of these firms have no other concerns than what is being written about them in the press. And in their opinion, they are negatively and unfairly presented to the point that it would appear that there is an outright campaign being waged against them. The journalists argued that the criticism was not unsubstantiated and pointed out the generally high prices on goods from "Polonia" firms which do not always reflect equally high quality, the not very ambitious production program, etc. The "Polania" businessmen did not deny that such cases do exist. However, they would not allow themselves to be convinced of the objectivity of the criticism, citing classic examples of the mistaking of the victim of an offense for the perpetrator or thief whereby in this case, the "Polonia" firm was to be of course, the presumed thief. In this atmosphere, a formula presented by the meeting chairman in accordance with the saying, "What was and is not is best forgot"["co bylo, a nie jest--nie pisze sie w rejestr"], turned out to be successful in ending the controversy. This made it possible to move on to discussing more important problems involved in the activity of foreign small business enterprises. Unfortunately, not a very comforting image was formed from the remarks made by the owners of these enterprises.

The export business of 'Polonia' firms, which grew until 1984, began to fall rather drastically. According to information given by Stanislaw Szumski, the assistant secretary general of the Polonia Society, this drop may turn out to be over 50 percent smaller than last year, at which time it amounted to $23 million rising in comparison with 1983 by $7.2 million; i.e., more than 45 percent. The owners of the "Polonia" firms gave as the reason for the decline in their interest in free foreign exchange exports (at the same time, they are implementing increasingly larger deliveries to CEMA countries), the unfavorable changes in the financial conditions of their operations and, in particular, the introduction on 28 July 1983 of the obligation to sell half of their foreign exchange revenues to the state at the official rate of exchange for the zloty. "We do not want a return to the state when exports would balance out imports," they assured. "We want to export and we understand that the state must benefit from this also." However, at the same time they also declared in no uncertain terms that they, too, must make a profit from exports and in no case can they lose on them. Meanwhile, Stanislaw Lewandowski from Sweden, the owner of a furniture manufacturing enterprise and the most eloquent spokesman for the interests of the "Polonia" firms, explained demonstratively that with the currently overly high official rate of exchange for the Zloty, the sale of half of the export revenues at that rate, radically raises the cost of obtaining one dollar. This requires that exports be implemented at $2. If in this case, the cost of one dollar amounts to, for example, 300 zlotys (and that of $2--600 zlotys), then during the sale of one dollar at the official rate, the other dollar costs the exporting firm approximately 450 zlotys. Business becomes all the more problematic if, in addition to this, the firm pays a high commission (10 to 12 percent) to the foreign trade enterprise whereas production requires an import "input" also in free foreign exchange. Therefore, the calculation is fundamentally simple.

Thus, both exporters and potential exporters feel that, first of all, a half is too much (at the most 30 to 35 percent, although, it seems that not everyone would be willing to agree even to this). Secondly, they cannot lose on the exchange rate. The best thing, explained Mr Lewandowski, would be for the rate to be realistic and binding for everyone. However, since this is not the case and since the "Polonia" exporter cannot take advantage of the countervailing account as is the case with socialized enterprises, the exchange rate losses should be somehow compensated, for example, with tax breaks.

The drop in free foreign exchange exports of private enterprises should not come as a shock to anyone, stated their owners. They had already anticipated this at the time of the introduction of the amended rules and regulations and they gave signals of this to the authorities. During the meeting, they also made it very clear that keeping these regulations in force in their current form will lead to the further decline of exports and, consequently, to the decline of incoming foreign exchange into the state treasury by virtue of the compulsory sale. According to the discussion participants, it is possible to find solutions that would generate appropriately large, systematic export growth and an absolute increase in the foreign exchange income of the state with a reduced rate of compulsory sales. In any case, the "Polonia" businessmen feel--as is only fitting for true business people--that only mutually advantageous rules and regulations can be the foundation for any kind of sensible economic activity.

It was also pointed out in the discussion that the legislator did not look into creating any kind of investment incentives without which there can be no talk of expanding production and the export of products of the highest technical caliber. The "Polonia" businessmen are not allowed to finance the purchase of equipment from current export yields; there are no foreign exchange depreciation allowances whatsoever whereas the 10 percent zloty rate is too small. This means that the depreciation of equipment occurs during a period of 10 years whereas modern production requires that this period be reduced to 2 to 3 years. Furthermore, investment incentive rates have also not been incorporated into the tax rules and regulations, treating the profits of an enterprise owner on an equal basis with the part that is set aside for the development of an enterprise. The tax policy of the Ministry of Finance has been accused of excessive fiscal stringency with no room for the creation of conditions for the stable growth of "Polonia" firms. At times, there was an outright tone of a kind of suspicion whether there is not a hidden intent to restrict this growth. In any case, in the eyes of the interested enterprises the situation matured to a serious discussion about state policy toward foreign small business enterprises.

MISUSE OF ENTERPRISE MOTOR POOL VEHICLES DEPLORED

Bucharest REVISTA ECONOMICA in Romanian No 48, 29 Nov 85 pp 7-8

[Article by Dr Nicolae Antoniu]

[Text] Transportation is a vitally important branch for the national economy, comparable to the "circulatory system" of a living organ, with any defect and imbalance in this mechanism producing shortcomings in all areas of production and consumption and in the development of public life. Taking into account their special importance in society, our party and state have given and are giving great importance to the development and modernization of transportation and to the growth in the economic efficiency of activity in this basic sector of the national economy.

The current stage of intensive development of Romania's entire national economy urgently requires as an objective need the growth in economic efficiency in the branch of transportation, also. At the RCP CC Political Executive Committee meeting in October 1985 it was felt that, although the share of transportation expenses in total material production expenses and in social product has fallen year after year, the Ministry of Transportation and Telecommunications as well as other ministries and economic units with means of transportation have not taken all the measures necessary for this purpose and, for that reason, transportation expenses continue to be high. Proceeding from this fact and from the requirements for firm application of the economic-financial mechanism, the motor vehicle transportation sector also has special tasks with great responsibility, where decisive measures have been established to have substantial reduction in transportation expenses, also taking into account that costs in this subbranch of transportation are much higher than in the other transportation sectors.

The current system for organization and operation of the motor pool was set up years ago (1960), when concentration of the motor pool took place in the big specialized transportation units, marking the limits of the area of action of the general-purpose pool (public) under the Ministry of Transportation and Telecommunications from the internal one, under the administration of ministries and other central institutions , enterprises and so forth, which have at their disposal a limited number of motor vehicles and the purpose of which is to provide their own transportation in the sphere of production. At the present time, besides the pools belonging to the Automotive Transportation Enterprise, which holds the greatest share, and the Enterprise for Specialized Agricultural Transportation), a large number of motor vehicles are concentrated at other holders of motor pools, either for general transportation or for specialized transportation by areas--oil, chemistry, mining, geology and so forth.

It is clear and statistical data express that year after year the technical-economic indicators for operation of means of transportation (coefficient of use of the pool and coefficient of use of the capacity, daily average route) have recorded considerable improvements and that, due to permanent concern, the public motor vehicle pool enterprises have fulfilled and even overfulfilled the plan tasks and have recorded savings in the production costs and have fulfilled the profits plan and so forth. At the same time, one should not lose sight of the fact that, analyzing the indicators of efficiency--productivity, production costs and so forth--one may determine the high output of the general purpose pool over the level achieved by the internal pool. In some ministries and central organizations, the indicators of usage of motor vehicles in the supply generally represent 60-70 percent compared with the enterprises of the Ministry of Transportation and Telecommunications, although the results obtained here cannot be considered maximum, either.

Analyzing the indicators which caused the growth in productivity in the current five-year plan, one thus may note, along with the fact that the quality indicators of the enterprises with a public pool still have large reserves for improvements, that those achieved by the internal pool are at a much lower level. As pointed out at the meeting of the Political Executive Committee, the unjustifiably high cost recorded by the units with their own pools negatively affects the level of production expenses, seriously burdens the enterprises' budgets and conflicts with the requirements for economic-financial self-management.

Currently, some ministries and central institutes have formed their own pool of oversized motor vehicles. The major interests of the national economy require that the means of transportation in the supply of all holders of motor pools should be used with maximum efficiency and that the leadership factors in each economic unit should consider in certain situations whether it would not be more economical and advantageous to use means of transportation from the general-purpose pool or, even better, to resort to railway transportation. And this is because many times a lot of standing time is recorded by the motor vehicles in their own pool or they are being used way below their capacity for uneconomical distances and they are not maintained and operated appropriately, which causes high gas consumption, repairs and other transportation expenses.

Under conditions where the indicators of efficiency, particularly the level of transportation costs with their own motor vehicles, are not at a level lower than the general level of costs established for transportation with vehicles from the general-purpose pool, from an economic viewpoint it is justifiable for the holders of the pool in question not to be entitled to have their own motor vehicles in use. For that reason, in our opinion, the main direction for rationalization and rise in efficiency is to continue the process of concentrating the pool in large, specialized units, which would allow fulfillment and even overfulfillment of the current indicators of operation achieved by the units of the Ministry of Transportation and Telecommunications.

At the same time, we think it is reasonable for some ministries and central units to be able to have at their disposal their own pool, of a reasonable size, one which would be used exclusively for carrying out specialized transports and at the level of efficiency reached by the enterprises with a public pool for general service. We think it timely and efficient to establish and improve the activity of some single transport organizations by centrals, groups of enterprises and by cities, for the units situated within a city or certain azone,by concentrating the vehicles belonging to the particular units and using them reasonably.

The requirements for more efficient use of the motor vehicle pool require a stricter definition of the area of activity, both within the current organization of the country's motor vehicle pool as well as between the various subbranches of transportation--motor vehicle, railroad, river and sea. So we feel that the following should fall within the task of the pool of the Ministry of Transportation and Telecommunications: transportation of goods within the counties, the transportation of bricks and cement, sand and other mass products from factories and pits, except for internal transportation of the construction sites; transportation and expediting of goods by a combination of motor vehicle-railroad, motor vehicle-ship and motor vehicle-airplane; intercity transportation of people by bus. In this case the internal pool would have the following categories of transportation: the job site and plant transportation, transportation of intervention needed to eliminate defects occurring on the railroad lines, in the pipes for transporting of oil and gas products, in the water supply and distribution lines, roads and bridges as well as electric, telegraph and telephone lines.

By branches of the economy we feel that the motor vehicle pool for internal transportation should have the task of carrying out most transportation from industry and construction, occasional transportation from the branch of goods circulation, as well as transportation from agriculture (except for the harvest campaigns for fruits and vegetables, stalky crops and corn, when a portion of the volume transported should also be carried out with the public motor vehicle pool of the Ministry of Transportation and Telecommunications).

The demand for reasonable and highly efficient use also is required with regard to motor transportation made by the units of the Ministry of Transportation and Telecommunications, where rather high costs are being recorded. It is significant for us to specify that motor vehicle transportation is the most expensive kind (10 times greater than railroad transportation). Under these conditions it is necessary that, by analyzing the way in which the requirements for transportation of the national economy are provided, there be a reduction in the volume of goods transported with motor vehicles which involve the highest gas consumption and the highest costs. For this purpose it has been forecast that by the end of this year a 30-percent reduction is to be obtained in transportation of goods among the counties and more than 80 percent in transportation of passengers --which leads to the savings of appreciable quantities of fuel. What is more, studies made by specialists show the possibility for passing on to the railroads around 20 percent of the current volume of goods and passengers transported by motor vehicle.

Greater attention should be given in each transportation unit to rational use of the motor vehicles, on economical routes and at maximum capacity, extending the actions taken to increase the capacities of transportation by making the bodies much higher and by increasing the number of trucks to 3-5, compared with the 1-2 currently pulling the big-capacity motor vehicles. Although there are some achievements from this viewpoint, goods transportation in containers and by palletization does not hold a percentage which corresponds to existing conditions and the clear advantages they offer. Extending this efficient form of organizing the expediting of goods can contribute to reducing standing time for loading and unloading by 20 percent, reducing the labor force involved in handling the goods by 50 percent, the direct effect of which would be to have available around 3,000 motor vehicles, together with significantly reducing transportation costs.

ECONOMIST SAVIN ON IMPACT OF DECLINING OIL PRICES

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 14 Feb 86 p 8

[Article by "zrn": "Lower Interest Rates the Greatest Gain"]

[Text]

Yugoslavia has long-term contracts for the purchase of petroleum, which places it in a position of not taking advantage of the impact of falling petroleum prices. We should not expect the prices of petroleum and petroleum products to fall in Yugoslavia, says Dr. Davor Savin, economic adviser to the president of the SFRY Assembly. We pay for petroleum with the dollar, which is mostly rising, while the dinar is falling. On that basis, then, it is certain that the drop in the price of petroleum will not have an impact on the Yugoslav economy.

"Yet it ought to be emphasized," Dr. Savin said, "that if the negotiations with the countries from which we purchase petroleum turn out successfully, these purchases may be less expensive in the future. Even in that case, however, Yugoslavia ought not to lower the price of petroleum. There are two strong reasons for this: the real price of petroleum and gasoline is at the 1977 level, and the gasoline tax is also one of the important sources of revenues for the federal budget. The additional income might be used in the budget to reduce the turnover tax on indispensable articles such as food. The government might also use that surplus to stimulate the economy and development programs."

Although logic argues that the drop in prices of petroleum on the world market ought to work towards a drop of prices in our country, Dr. Savin feels that it should on the contrary be burdened with additional taxes. But they should at the same time be accompanied by an opening up of other channels for conversion from petroleum and gasoline to other sources of energy.

Lower petroleum prices, accompanied by a drop in the dollar, will bring about a certain restructuring of currencies in the European monetary system. Dr. Savin estimates in this connection that there will be a pressure for revaluation of the German mark and devaluation of the Italian lira. If the mark is revalued, in practical terms this means that Yugoslav exporters will obtain a greater value for the same quantity of goods, but they will also lose if the Italian lira is devalued. In that case of course everything depends on the composition of our economy's exports.

"A drop of about 10 percent in the price of petroleum reduces world inflation by about 0.5 percent. The larger the drop in petroleum prices, and such assessments have been made by authoritative international institutions, this would reduce world inflation still more. But, and this is very important, it would lower interest rates on the international market for capital by the same percentage. This at least is very favorable for us. The reason is that every percentage point the interest rate drops on the world market means a benefit of one-third of a billion dollars for us."

SAVIN ON INFLATION, POSSIBILITIES FOR INCREASED OUTPUT

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 15-17 Feb 86 pp 1,5

[Interview with Dr. Davor Savin, economic advisor to the president of the SFRY Assembly, by Zoran Nikodijevic, date and place not specified]

[Text]

The beginning of the year does not promise any very essential change in the economic situation. Wishes, and indeed even announcements of possible changes, were quite different, but even in the first month inflation reached a fantastic 7.5 percent. The explosion of price rises is still not dropping off, and one gets the impression more and more that the economy is simply unable to prevent it. Why? Where are the mistakes, and who made them? Is it possible that there are no instruments that would have an effect on the worst sources of inflation, or are we unable to precisely determine the true causes, from which appropriate measures would follow with great certainty.

We attempted to obtain answers to these dilemmas from Dr. Davor Savin, professor and economic advisor to the president of the SFRY Assembly and a well known expert in monetary theory and international economics.

"The most unpleasant economic phenomenon at the beginning of the year is certainly the higher rate of inflation. The 7.5 percent rate of inflation in January is a warning signal that the annual rate might be somewhat less than eighty percent. Judging by the trends which have taken shape and the strength of the factors that have a bearing on the setting of prices, it is not very likely that economic policy will be able to reduce inflation very appreciably below the present level during this year. I even feel that it will be a success if it keeps it from rising higher. Above all because all the factors of inflation are still operating with full force, Dr. Savin said.

"Yugoslavia confronts a steady rise in the costs of business operation, since costs are increasing. That is why we cannot expect any particular change on the cost side, however many new things there might be in the area of demand. That is, over the last several months demand has been growing more rapidly, appreciably greater than anything that was anticipated. Personal incomes have even increased in real terms, which from the standpoint of the standard of living of the employed labor force is of course a good thing, but their rise has come at a time when production is virtually stagnant and when we confront all the problems that bring about disequilibrium in the economy. So, demand has now been added as a special pressure to this factor of costs as a consequence of the rise in real personal incomes. It will be difficult in economic policy to keep this under control in coming months.

[Question]: Does this mean that the programmed inflation, and the drop in interest rates on that basis, is not in economic terms the basic thing during this year?

[Answer]: Not just this year, but in any year! The very concept of programmed inflation makes no sense in economic terms. I feel that this will be yet another experiment that will join the ranks of the other failures of economic policy. There is no programmed inflation nor programmed aggregates that can solve the problem of Yugoslav inflation! The essence of bringing down inflation is that we have to have productive and efficient production, that is, we have to create productive and efficient jobs. We need a rise in the productivity of labor, efficient conduct of economic activity, and at the same time a growth of output, which reduces business costs and creates room for reducing inflation.

[Question]: Is that also the answer to how to reduce inflation?

[Answer]: It is the briefest and simplest answer to all the questions which economic reality is posing today: What is to be done, and how? Yugoslavia has to increase production. Increase production no matter where. That is better than for our productive potential to go unused. We have factors available to us, including skilled manpower, but we are not increasing production. The number of unemployed is holding at a figure of about one million.

The attempt which economic policy might make in an effort to reduce prices on the basis of programmed inflation, a programmed rise of the exchange rate and interest rates, which is one of the models which has been talked about more and more recently - is condemned to failure in advance. And I mean absolute failure. In psychological terms the message offered by that model is attractive, since it argues that one of the most painful problems of the Yugoslav economy can be solved in a single stroke, a relatively painless stroke. If that were really possible, then every country would solve all its problems without difficulty, since it would simply program something, which by nature it is unable to do. We have to speed up production, but in those sectors where we have all the comparative advantages and capabilities, which are agriculture, housing construction, the tourist industry and small business.

The Worst Alternative

[Question]: Why do you insist on precisely those sectors?

[Answer]: I insist on them precisely because it is in these sectors that we possess all the necessary potential: productive potential and labor, skilled manpower. In agriculture we also have specific advantages - available land, genetic engineering. The worst alternative is to try to freeze prices with various financial manipulations and moves of the "salto mortale" type; the programming of inflation is no solution. We may resort to what I have called an experiment. No matter, it is not the first, nor will it be the last, but the outcome is known in advance.

[Question]: Does this mean that this year will also pass by while we are trying to find our way?

[Answer]: Yes, that is exactly what it means unless we solve fundamental problems in a fundamental way. Whose mistake is it? We cannot look for it in the orientation of economic policy, since every economic policy promises something. If someone is told that programmed inflation will lower interest rates, slow down the slide of the dinar, that is so attractive that few people can tear themselves away from the idea of pursuing such a policy. But economic science does exist, and we have both our own lessons and experiences and those of other countries, and taking them into account we can know what the result of a particular measure will be.

[Question]: Who, then, is shaping such a policy, the politicians or economists?

[Answer]: We should not pose such a dilemma, since that will not get us far. Every politician wants the best for his country. However, in our economic and political development science has been much less present than it ought to have been. That incidentally is nothing new. Or, the answer I would give would be comical: With more knowledge we would have solved the rise of inflation. I repeat, it is really funny. At the same time I do not deny that a greater presence of knowledge and economic thought would have helped to find more optimum solutions. But what I am trying to say is this: the basic orientation which economic policy must follow is an aggressive orientation not towards bringing down inflation, but towards increasing production.

A "Miserable" Three Percent Growth

Consequently, for me inflation is not the priority goal of economic policy in 1986, but rather the organization of economic life that will lead toward a growth of production wherever possible. And my thesis is that it is possible to augment production. We are highly dependent upon imports. At the present moment we cannot increase industrial output by one hundred dinars without imports rising by approximately some twenty dinars. Yet there is nothing with which to pay for those imports in view of the financial restrictions: new credits cannot be obtained, and there is the obligation of repaying the old ones. Accordingly, the growth of industrial output is impossible without additional imports, but then again we face those restrictions.

Why is it that the growth rate of industrial output in Yugoslavia sticks at about three percent? Because in the financial environment as it now stands, given the strength of Yugoslav exports, with the present restrictions imposed by the balance of payments, the maximum growth of industrial output is precisely those "miserable" three percent. And there are no combinations whatsoever with which it would be possible to increase industrial production more than three percent, and that in turn is insufficient.

[Question]: Are there solutions to this?

[Answer]: With an orientation towards economic activities whose dependence on imports is low or nonexistent (agriculture's dependence upon imports is five percent, housing construction between six and seven, and it is negligible in small business and the tourist industry), we could bring that growth of production up to a much higher percentage with a relatively low content of imports, and then with that production we could pull everything else forward by the value of the multiplier (it is somewhere around 1.5, which means that for every 100 dinars of primary production, there is an increase of 150 in secondary production). A well-thought-out orientation towards that production could make it possible for a sizable portion of it to be exported.

An orientation which advocates a drop of prices instead of encouraging production is condemned to failure in the short run, precisely because of the restrictions imposed by the balance of payments. The primary goal must be to increase production, and that must be done precisely in agriculture, the tourist industry, construction and small business because of all the comparative advantages, and there also is the key to solving inflation.

SLOVAK JUSTICE MINISTER VIEWS ROLE OF JUDICIARY

Bratislava PRAVDA in Slovak 5 Feb 86 p 1

[Article by Jan Pjescak, Slovak minister of justice: "Revolutionary Role of the Judiciary"]

[Excerpts] Full participation of the working people in state administration and management is the most important feature of socialist democracy and the most effective instrument of strengthening and perfecting our socialist society. It embodies the fundamental principle of socialism which states that the people are the sole source of power in our society, as it is anchored in our May 1948 Constitution which was ratified following the February 1948 victory. The legislative enactment of the revolutionary Leninist principle of the broad participation of the masses in the judiciary resulted in our country in the practical application of one of the most important revolutionary tenets, namely, that in a society which is building socialism the people not only formulate but also execute laws through the intermediary of their representatives.

Popular participation in judicial proceeedings has profound political significance. It mirrors the process of intensified socialist democracy in the life of our society, and acts as prerequisite for higher quality and effectiveness in the work of our courts, with strict observance of socialist legality and in the development of citizens' socialist legal awareness. The fact that the court system today represents an important element in the building of a socialist society is largely due to the participation of people's judges, workers, cooperative farmers and members of the intelligentsia, who greatly enrich this system through their experiences, revolutionary thought and activist dedication to a consistent application of the juridical policy of the party and the socialist state.

In addition, the people's judges in their places of residence and employment provided valuable educational activity by sharing their court experiences with their neighbors and coworkers, thus promoting the benefits of socialist legality.

The basic and most important task of the people's judges is their active participation in judicial debates and decisions in both criminal and civil proceedings. Their performance is, naturally, predicated on proper preparation for participation in these decisions. It is an important substantive and political task of the professional judges to thoroughly familiarize the people's judges with the matters they are dealing with. For in our judicial system the people's judges are guarantors of the close linkage of the courts with the life of our society.

It is, therefore, essential that all presiding judges make sure that their people's colleagues are fully conversant with the substantive and legal aspects of each individual case. As early as in the selection process, the presiding judges must carefully consider the people's judges experience, education and professional specialty, as well as other requirements for this important task. For example, in cases dealing with juvenile delinquency or breaches of child-support laws, presiding judges should select people's judges with extensive theoretical and practical experience in the upbringing of the young generation. In cases of economic crime, the selection should include economomists, engineers and other experienced specialists. Such criteria-motivated selection ensures direct and professional participation in each individual case by the people's judges. Through their own experiences and political maturity they can help the court to delve into the very essence of each case, the real causes of labor disputes, divorces, traffic accidents, economic crimes and other punishable acts. Moreover, through such activist participation the people's judges can help to make sure not only that the guilty be punished but also that the causes of illegal activity be eliminated.

The tenure of people's judges elected in 1982 expires this year and new ones will be elected for a 4-year term under Law No. 36/1964 on court administration in the selection of people's judges. While the tenure of professional judges is 10 years to enhance responsibility and continuity, the term for people's judges is shorter, since they hold public office in addition to their normal employment.

Broad experience of the courts clearly confirms that about 10,000 people's judges in the Slovak judiciary play an important role in our system of jurisprudence. They have become truly a revolutionary factor, notably in the judiciary's cooperation with the National Committees, social organizations and labor collectives in the handling and resolution of criminal and civil cases, while enhancing socialist legality in our country. The Slovak Ministry of Justice has issued new directives which clearly delineate the role of the people's judges in both judicial decisions and in preventive education in their places of residence and employment. These directives also regulate the people's judges' collectives. Based on their experiences, the people's judges will alert state and other organs, especially the National Committees, economic and social organizations, to concrete cases of infractions and shortcomings in the conditions and causes of criminal activity in state-protected civil, family and labor relations, in order that criminality and other negative manifestations might be prevented.

The people's judges will also assist the National Committee and Trade Union commissions in out-of-court disputes in civil, family and labor relations, and in the protection of children and juveniles from harmful influences.

In places of their residence and employment they will promote voluntary compliance with court decisions and agreements on educational measures for minors.

As part of their judicial and educational duties, the people's judges will help organize and actively participate at their places of residence in lectures and seminars on current problems in the maintenance of socialist legality.

PUBLIC TRANSPORTATION IN NEED OF IMPROVEMENT

Prague RUDE PRAVO in Czech 17 Dec 85 p 3

[Article by Zdena Stepankova: "Can Public Transportation be Improved"?]

[Text] I have travelled recently by an express bus from Prague to Brno; upon arrival at the Brno bus terminal, the passenger sitting next to me looked at his watch, then turned to me and said appreciatively: "Some transportation, isn't it? Fast and precise!"

He was right. Travellers can have full confidence in express buses. It does not even occur to anybody that, due to delayed arrival, a connection could be missed. Unfortunately, such confidence does not apply everywhere.

What are the characteristics of civilized and quality conscious public transportation? Primarily, speed and precision, but also easily accessible stops, frequent connection, comfortable and clean means of transportation, friendly behaviour of personnel; other services connected with travelling such as seat reservation or timely and good information.

As a matter of fact, passengers have many comments on the quality of transportation which are certainly legitimate. Let us talk about precision for instance. There are hardly any complaints about bus transportation; buses leave on time, delays are rather an exception, justified maybe by bad weather or bus brake-down. Railroad traffic delays, however, have to be taken into account already beforehand. Allegedly, an average delay is not more than 10 minutes, but such an average can be deceptive. Sometimes 10 minutes are sufficient to make the traveller miss his connecting train and make him wait maybe 3 hours for the next one.

The Ministry of Transportation has already made some provisions for improvement, but, so far, with only negligible results. The traveller realizes that a train cannot arrive on time in Olomouc, when it left Prague already with a delay. The railways have many problems with smooth running and through passage of trains; it can refer to certain objective difficulties, but as long as conclusions other than traffic reports will not be drawn from delays, the keeping up of schedules will not become a matter of honor to everybody who participates, in whatever way, in the passage of that particular train.

The passenger requires comfort. Buses and trains with seat reservations assure him such comfort. We could cite the already mentioned fast trains from Prague and Bratislava, as well as other long distance lines. The railroads introduced obligatory seat reservations on the trains Kosican, Tatran and Ostravan and on night sleeping cars and sleepers Devin and Hornad. People appreciate them; it must not happen though, that the car attendant forgets to wake up the passenger before the earlier designated station and does so 100 kilometers farther.

Bus transportation is cleaner than railroads. It is understandable. The distances covered are usually shorter and should it be longer, refreshment and rest room facilities are offered outside of the bus. The railways have to furnish such services and they hardly could be called satisfactory. The report prepared for the People's Chamber in October dealt with transportation problems; it informs us that for sanitary facilities in trains, about 95 tons of toilet paper, 103 tons of paper towels and 10 tons of soap are used per year. The expenses amount to almost 3.5 million crowns. Without wanting to be suspicious, one asks what happends to all these items? Are they really serving the passengers? Or, more precisely, only the passengers?

The damages caused every year by travellers in trains amount to approximately 15 million crowns. It is almost unbelievable, how people can ruin things around them. And it is not only vandals who cut up the seat upholstery for their pleasure; the real cause of all the damages is mostly alcohol. As most of the train attendants are women, they do not even dare to enter a wagon with alcoholics. Drunks can be aggressive and dangerous and it happened already that they threw the attendant out of the train. At the upper-mentioned session of the Chamber of People, an example related to a train attendants refuse to step into. It runs from Galanta to Ostrava carrying employees of the Ground Construction Kosice; after each trip it is regularly so devastated that the damage costs reach 30 thousand crowns. Complaints to the employer lead nowhere, the enterprise rather pays for it. Another special case are trains with new conscripts. Here again, the main cause is alcohol.

One of our readers shared with us her experience. She was going from car to car looking for a seat. She did not find any due to the fact that some passengers simply used the seats as beds and did not let anybody enter the compartments. When she asked the attendant for help, he only shrugged his shoulders which meant to say that nothing can be done.

Many appeals, admonitions and exhortations have already been made. Drunks or vandals should be sometimes expelled from the train. But women attendants should not be asked to do it, it should be the duty of the Armed Railroad Patrol which should intervene more often.

The cleanliness in the trains is a chronic disease of our railroads. It is alleged that mechanized services are inadequate and that there are not enough people with buckets and brooms to clean the wagons. But certain railroad stations are not much better. While some of them are clean and inviting, touching anything elsewhere has to be avoided in order not to get dirty. Approaches to larger cities are, as a rule, littered with soft drink containers and paper lunch bags, as many passengers have a strange habit of disposing of their refuse by throwing it out of the window prior to arrival at their destination. When the surroundings of the stations become unbearably littered, railroad employees organize from time to time cleaning brigades. Nobody intends to excuse the undisciplined travellers, but aren't they often induced to it by the generally unkempt environs? Nobody would throw anything out of the window at a well kept railroad station.

The public bus, railroad and city transportation is and always will remain under a strict control of the passengers. People going to and from work or for recreation want to arrive on time and if possible also comfortably. Everybody wishes to get a seat for a longer journey and this is provided for by a seat reservation; on shorter distances, especially in city transportation, people do not mind to remain standing; but even this has its limits. When indicated in the bus that the standing passengers must hold on to a strap, the straps should be provided.

Drawbacks may occur everywhere, even in transportation. Particularly on principal railroad lines, little is needed to disrupt the traffic and to cause delay. However, the passenger deserves to be told why the train was late and is owed an apology.

Let us return to the question how and if the passenger service can be improved. Objective difficulties, such as obsolete rolling stock, unfinished railroad stations, lack of personnel in some branches will not be solved from one day to another. But improved conditions are being created. The average daily number of bus connections on working days reach approximately 170,000. Over 91 percent of the population have a CSAD (Czech Bus Transportation) stop not farther than 2 kilometers from home. Based on inquiry and comments of travellers, new train connections were introduced from Bratislava and Kosice to Liberec, from Kosice to Ceske Budejovice and Decin, from Prague to Luhacovice, Zvolen and Kosice via Bratislava; others are under preparation. In Prague, an additional section of Metro was put into operation. But to increase a civilized standard of travelling and to improve passenger traffic requires not only considerable investments and changes, but daily attention as well. That applies to all bus and railroad traffic. For example in Prague, with newly rebuilt city traffic and new bus and street car lines introduced, it should become a general practice to announce the names of the stops. This, too, belongs to the quality of passenger transportation.

TRADE UNION COUNCIL REPORT TO 25TH TU CONGRESS

AU260601 Budapest NEPSZAVA in Hungarian 14 Feb 86 pp 3-8

[Report of the National Council of Trade Unions submitted by Chairman Sandor Gaspar to the 25th Congress of the Hungarian Trade Unions on 14 February 1986: "Oral Report of the National Council of Trade Unions--To Be Submitted by Sandor Gaspar"]

[Text] The rich traditions of the Hungarian trade unions, their 4 decades of hard and successful activity for the construction of socialism, and their devotion to the cause of the working people, and a response to the demands of their members, obliges the 25th Congress to:

--Report, on the basis of the members' opinions, on the implementation of the decisions of the 24th Congress held in 1980, on the movement's development, and to outline the most important tasks of the coming years;

--Carefully analyze the situation of the trade union movement;

--To find the way in which the movement, adjusting to the current circumstances and tasks, can fulfill even better its mission, which is to help construct socialism.

The report of the National Council of Trade Unions SZOT to the congress wishes to fulfill these requirements in its written report, in the oral report, and in the draft resolution.

The membership as a whole thoroughly evaluated the movement's achievements since the last congress. Through lively exchanges of views in trade union groups and basic organizations, at county delegate meetings and branch congresses, the members debated and adopted the reports on the activity carried out, on the problems and tasks. Reviewing the economic and social situation of narrow and broader surroundings, the work place and the country as a whole, the members evaluated the trade unions' activity as positive. The members pointed out, however, shortcomings and mistakes everywhere. They expressed their desire for more courageous stands of initiative and made numerous proposals for the improvement of our activity.

Recognition of the fact that the vital source of the Hungarian trade unions' strength and activity is their identification with the cause of socialism and committed representation of the interests of organized workers--a representation based on the rich experience of several decades--is reflected in the value judgement of the membership. The members expect of the trade unions that they display greater sensitivity and attention to living and working conditions and to personal problems, that they strengthen their relations with the masses and strata which they represent, and further increase and assert their influence in public life more precisely and more efficiently.

There Can Be No Construction of a Socialist Society Without a Strong Trade Union Movement

Under radically new conditions and amidst increasing tasks and different conditions, the trade union movement has considerably advanced ever since the liberation. However, the path of development and the practical implementation of the trade unions' social and political role is a long process, a road full of bumps and twists in some sections, also under socialist conditions. The people's democratic revolution between 1945-48, the period of the struggle for power, represented also for the trade union movement a "change in course," fresh ideals, and new methods of approach compared to the period prior to the liberation. The workshop committees took a firm and successful position of initiatives in representing general local interests. They often had to take upon themselves tasks that exceeded their original functions: They started production, organized the supply of workers with goods, and distributed the scanty goods. It was primarily this activity that increased or recreated the tradition-rooted prestige of the trade union movement in the eyes of the workers, and at the same time, this had a perceptible effect also on other strata living on wages and salaries, among whom several new trade unions also emerged. The working class became a partner in power and the capital could operate only under the strict supervision of the state and the workers. The old and new elements of trade union activity developed and took shape accordingly. The trade union movement was also able to have a considerable say in all the important issues affecting the workers. The movement's organizational activity embarked on a dynamic development; the movement increased its influence in the so-called "blank spots," among women, youth, and employees, and supported the cause of education, culture, and sports.

In working out the political system of socialism, the party, which was gradually abandoning the path of Marxism-Leninism, did not apply the Leninist principles in dealing with the trade unions, either, and did not make use of the advantages deriving from the change in power. It curbed the activity of the trade union movement, thus causing great damage. The enterprise committees were eliminated, the stewards' role was reduced, and so was the influence of the trade union movement. The system of directions carried out by the party guidance threatened the independence of the trade union movement. The decision of the Political Committee of the Hungarian Workers' Party of 1950 accused the trade unions of "syndicalism," of being the enemy's hiding place.

The TUNC-decisions following the party decision of June 1953 promised changes in the interpretation and practice of trade union functions. But the changes, the attempts to correct the mistakes, and the vacillating and often precipitate and inconsistent steps proved to be insufficient. They were not accompanied by a comprehensive analysis of the mistakes and practice of previous years and by the drawing of necessary conclusions. It is unfortunately true that, although the trade unions occasionally expressed their dissatisfaction with these mistakes, they were unable to take a stand against these mistakes.

In spite of these distortions, the post-1945 period brought fundamental changes in the trade unions' activity compared to the capitalist period. The increased membership of the trade unions, their weight in public life, and the development of industrial branch trade unions represented indisputable advantage, influence, and power. Following the liberation, the Hungarian trade union movement started on a new road.

Taking into consideration the lessons of the past, the trade union policy of the MSZMP developed on the basis of Leninist ideas. The leaders of the reorganized party and the communists working in the SZOT set out immediately--already at the 10th SZOT Plenum in January 1957--to search for methods aimed at developing the trade union movement under socialist conditions. Following on this path, we regard it necessary to point out now too the importance of certain experiences.

The MSZMP recognized and asserted the truth in practice that a socialist society cannot be constructed without a strong trade union movement. We made repeated efforts to increase the trade unions' independence, political weight, and social prestige. We must create guarantees to avoid past mistakes from being repeated. The sphere of authority of the trade unions increased steadily, from step to step. We have strengthened the movement's influence on society in two ways: on the one hand, by increasing the possibilities provided by the law and rights as well as the forums of enterprise democracy and, on the other, by improving the content of the existing forms of activity. The MSZMP is also aware of the fact that politics is a human activity and therefore, it must be institutionally guaranteed that the danger of mistakes in the course of decision-making should be as minimal as possible. This, however, can be achieved only if the decisions are made and are implemented with the collaboration of the people affected by them.

Independently and Committed to the Cause of Socialism

We attribute great importance to the fact that the MSZMP Central Committee summed up the essence and experiences of its trade union policy in its position of 12 October 1983. Following Lenin's principles, this document characterizes and determines the trade unions "as the most comprehensive organization of the working class in power, of the workers living on wages and salaries." The document declares that the trade unions act independently; contribute to the acceptance of the goals of socialism and mobilize their members for the implementation of these goals; based on their extensive rights guaranteed by law, they represent and protect the workers' collective and individual, daily and long-term interests; take part in working out the regulations connected with living and working conditions and in supervising the implementation of these regulations; in representing collectives, they can make use of their right of objection and can veto possible violations of law and mistaken measures.

The position of the Central Committee confirms that "...the trade unions' role in our society continues to increase." Our system of economic management--continues the position--creates the independence of the local bodies, increases their responsibility, and this also provides the trade unions with greater possibilities and presents them with new tasks. The trade unions received an outstanding role in institutionalizing socialist democracy, including the work-place democracy: "in practicing work-place democracy, the trade unions must continue to represent the working collectives."

The trade unions gather together the workers living on wages and salaries. They contribute with their own irreplaceable means to the assertion of the leading role of the working class in our society, not only in a historical perspective but also in our everyday life and in the series of daily decisions.

The trade unions are present in every political, state, and economic forum where decisions are made concerning the workers' future and possibilities, and they unequivocally represent the interests of the employees.

In the spirit of the policy of alliance, the trade union movement itself connects the workers, intellectuals working as employees, and the different strata of employees. One of the characteristics of the development of the trade union movement is that, at the same time as its unity was strengthened and cemented its activity became more differentiated and open. Today's working class policy is therefore not a narrow-minded class policy but a wider policy adjusting to the realities, and this way it can really assert itself. Common interest and goals are the basis of solidarity and unity. Today we must know how to implement this under new conditions, a new interpretation, and in a new way. We endeavor to achieve a national consensus in the main goals of socialist construction. The essence of this consensus is that the other working strata of society take upon themselves to support the goals of the working class and the working class takes it upon itself to support the efforts of the other working strata in all questions that do not interfere with the fundamental goals.

On the basis of principles expressed also by the position of the MSZMP Central Committee, the trade unions carry out their activity independently while at the same time being committed to the cause of socialism. They recognize the party's guiding role in asserting the leading role of the working class. The trade unions participate in the shaping and implementation of the party's policy. They cooperate with the state bodies, public organizations and movements in implementing the great goals facing country and in solving everyday problems. The trade unions strive for the assertion of their own trade union and employee viewpoint in the above-mentioned relations.

It is today almost natural for the overwhelming majority of the present generation to enter the trade union movement at the same time as they start working. They almost take it for granted that their interests are protected, the forums of enterprise democracy are operating, they can join the trade union's cultural life, they can spend their vacations in holiday resorts, and they can get assistance if they need it. It is a great achievement of our life that the extensive activity of the trade unions is now taken so much for granted.

The position of the MSZMP Central Committee outlines the main trend of the society's development--including the trade union activity. Of course, it does not wish to provide a formula for solving the specific everyday tasks of trade union activity. It is the trade unions' job to consistently implement the tasks deriving from the position and this is a process that requires longer time. There are no readymade solutions for the development of trade union activity.

The trade unions have an active share of the power in Hungary. Therefore, they cannot restrict themselves to only representing the demands of the workers but they must also participate in the creation of conditions aimed at fulfilling these demands. The trade unions can fulfill their role in society well if they accept all the tasks meant for them: they are taking an increasingly independent part in guiding society, and they are endeavoring to develop the economy and to maintain and constantly strengthen social security, stability, and general consensus. The decisive element of all these is their participation in shaping policy. The trade unions, however, can genuinely fulfill their tasks if they strengthen their functions of representing and protecting interests. There has been a change in the content and possibilities in the way trade unions have represented and protected interests in past years: this activity has become more comprehensive and more flexible but conflict situations have at times brought the movement into a difficult situation. The trade union members agree to a socialist society--but they demand from the trade unions that they deal with their interests, the acceptable assertion of social justice, and with the affairs of individuals more efficiently, more quickly, and with greater consistency also in everyday work.

The requirements of efficiency and quality must be asserted in all areas of life, and thus in trade union activity too. Almost everyone demands the introduction of a more open working style, a more courageous attitude on the part of the trade unions, and their discernable and perceptible presence in the everyday life of millions of workers.

It is, however, difficult to change the accustomed rhythm of our work. Sometimes bureaucracy hinders the movement from getting close to the people, at other times--in the case of numerous new tasks--today we are still helpless and timid in action. There has been an increase, of course, in the number of critical and often cynical remarks in proportion to the number of unsolved tasks. It is obvious that we are not making use of all the possibilities and that we possess unused resources. However, it is also a fact that the trade unions' sphere of action is always determined by the development needs and possibilities of the entire society. The working-style of the trade unions--although undoubtedly in need of further essential improvement--cannot disregard the guiding system of society as a whole, its character, level, and consequences. It is only in the development of society that the new elements in the life and work of the trade unions will be asserted.

The assertion of rights, the development of work, and the strengthening of prestige have not been carried out without speculations, debates, and searching for the right way, because the role of the trade unions is only seemingly simple. Their mission, on the one hand, is to help the construction of the society and the consolidation of power and, on the other, to represent and protect the interests of the workers. It is difficult and contradictory to fulfill this dual responsibility. We must therefore be careful not to allow the "balance" of our thinking and activity to be upset in any direction, and to make sure that it stands in balance.

The general goals of the trade unions do not change. The conditions, circumstances, and possibilities, however, under which these goals can be organized in a program are constantly changing. This means a determined activity and struggle as a social-political force and requires independence. The achievement of these goals demands endowments and sills that the trade unions basically possess. We must give a positive answer to the question whether we are able to create the conditions for a more dynamic trade union activity which has a greater influence on the common cause. It is also true that this task demands a considerable improvement and further development of our entire activity.

The principle of the party's leading role is of universal validity but the mechanism of implementation of this role always depends on a concrete historical-political situation and on its changes. An important determining factor of the development of trade union activity and of the development of the entire society, too--on the basis of the principles of scientific socialism, a realistic and good policy--is the type of division of labor the party creates and the type of methods with which the party asserts its leading role in its cooperation with the trade unions.

On the Basis of Reality and Aware of the Workers' Views

One of the MSZMP's basic guiding principles is that, under its leadership, the fundamental interests of the working class--which include the interests of the entire working people--are represented, expressed, and asserted not by a single organization but by a system of institutions made up of several organizations and which reflects different interests. The party expresses the interests of the working class connected with the political struggle, power, the social-political system, and with the historical goals. The trade union, which identifies with all these and helps all these, represents in its particular area on activity and among its multifaceted tasks the economic and social interests primarily--but not exclusively--of the people living on wages and salaries in the system of production and distribution. Just as the party is doing, the trade union also places in the center of its activity the tasks which--deriving from their different but complementing role--they must represent and also solve.

The party can carry out the guidance, supervision, and orientation of society more efficiently if it can also rely on the trade unions' comprehensive activity in revealing and harmonizing interests. The principles must be asserted in practice. This, however, is not easy here, either. The 13th MSZMP Congress reaffirmed that, in asserting its leading role, the party is constantly searching for more developed methods to ensure the principled guidance and the necessary political influence and at the same time to avoid giving instructions, patronizing, and over-particular interference. The party is striving to make sure that the trade union bodies have even more opportunities for initiatives deriving from consultation with their members. The party facilitates the creative debates held with the economic and state bodies which are intended to bring about better implementation of tasks because only in this way can the trade unions' particular activity, their responsibility as a movement, and their high-level readiness for initiatives develop.

The assertion of independence and responsibility is an important condition for improving trade union activity. This is, at the same time, one of the important parts and complex problems of the efficient operation of our political system. It is important for the trade unions to have a clear-cut opinion and independent position on the major issues of the society's life, the economy and politics. With this, the trade unions can fulfill a responsible and creative role not only in working out and implementing the policy of socialist construction, but also in creating and maintaining national consent, which is indispensable for socialism. It is clear to us that it would lead to serious mistakes if the trade unions, by holding back their initiative and interest-asserting activity, were automatically to adopt the positions of their partners.

The trade unions should have their own position at all levels and on all issues, a position reflecting their particular role and mission. This, however, does not exclude--on the contrary, it explicitly requires--previous harmonization of positions which are important not only from the viewpoint of the creation of the coordination and harmony necessary in the socialist society but also in order to increase the trade unions' prestige and to support their activity. Implementing the political practice and carrying out instructions can be hindered equally by objective difficulties and subjective human errors. Of course, the trade unions cannot agree with mistakes and shortcomings, or with measures that adversely affect the values of socialism, the implementation of the policy of the working class, the interest of the workers, and their living conditions. In this respect, we must be "in the opposition," namely in opposition to mistakes and shortcomings.

The trade unions are committed to the cause of socialism. While they express this in their position and activities they do not identify with all the details of the implementation. When they think the latter needs corrections and changes and when they take a stand in some issues or details for a better solution, they do so precisely for the cause of socialism and as proof of their responsible attitude.

While we can report a general consensus as regards goals, there might be different opinions in judging certain tasks and in choosing the methods of implementing them. It is in the nature of things that, in these cases, we should honestly tell each other what we consider right and what we propose. The most natural right and responsibility for us is to express our opinion on the basis of reality and in the awareness of the workers' views. The interest of socialism requires the widest possible surfacing of views and interests, their formulation and assertion. The trade unions provide an important framework for this.

If we do not precisely understand our independence and responsibility, disturbances can emerge as a result. This can derive from the fact that we wish to assert our independence irrespective of space and time and do not take into consideration the realities, for instance, the tasks facing the country and the country's possibilities. We must always evaluate the real situation. We must express the trade unions' endeavors by judging the possibilities of the social and political organs with which we are thoroughly familiar and we must never disregard these possibilities. It can also be a source of danger if we do not genuinely deal with a justified demand because we consider that there is no chance of solving it in the given period of time. The trade union members do not accept this without explanation or justification--and they are right in doing so.

Trade union independence is still not sufficiently asserted. It is often not asserted to the extent the possibilities permit. Its social roots are still not strong and deep enough and thus this independence is asserted at very different levels and consistencies in different organizations and bodies. The trade union members, however, naturally judge the trade unions primarily on what these can do to improve their situation.

Interest Protection and Representation Adequate to Today's Requirements

The majority of the problems burdening the trade unions do not arise from their own internal life. Their activity develops together with the development of our society; the tasks facing the country, the changes in the economic and social situation and the subsequent possibilities and limitations are reflected in this activity. The situation of the trade unions is at present more difficult all over the world: circumstances have become more complex, the emotions surrounding their activity have increased, and without the necessary economic conditions, it is not easy to fulfill the justified requirements of the workers and of the trade union members. This is the situation in Hungary, too.

The goal is to create and operate relations and mechanism in which interests can openly appear, "can size up" their own sphere of influence, can connect with other interests to have a joint influence in the most varied forms of agreement and conflicts. This can present short-term difficulties; it requires greater attention and more work as well as an increased understanding of society's interests; in the long run, however, this is the only correct method. Although we accept diversity of interests in principle, many quarters still have difficulty in tolerating the concrete appearance of this diversity. It is thus understandable that the question of to what extent one should take into consideration the differences of interests in socialist construction becomes increasingly important. Interests are always searching for a way of expressing themselves. If mechanism exist, then this happens at the institutional forums of social-political publicity. If there is no such mechanism, then this easily slips through the possibilities of supervision and direct influence.

The trade unions play a part in many points in shaping and developing the final goal and the strategy. Their role is particularly great in everyday life, and in the details of implementation. Here, there is a direct need for them to have freedom of decision and action but this can only be interpreted under the circumstances and conditions of commitment and identification with the strategy and the historical goal. The trade unions' independence in shaping long-term goals and in the details of their implementation, as well as in everyday issues, is important because this is an essential means of maintaining and strengthening contacts with the masses and acquiring feedback that is useful in politics. It is not by means of declarations but only by fulfilling their functions at the most efficient and complete level that the trade unions can fulfill their vocation. There is also another thing involved here. This independence in daily matters and matters of detail is able to create firm trade unions whose contact with the masses is adequate and which possess social influence. The trade unions play a particular role in strengthening relations between the party and the masses. This outstandingly important role of the trade unions derives from the fact that they convey the interests that must be definitely taken into consideration in preparing decisions.

Cooperation between the trade unions and the state economic bodies is a natural phenomenon of our socialist society. Most workers support the fact that the trade unions share the views of the state and economic leaderships on fundamental issues when the trade unions have participated in the activity by having their members included and their interests expressed and represented. It is true that this cooperation, which is not easy, requires a sense of vocation, responsibility, and the consistent representation of views and opinions on both sides. It requires the formulation and discussion of proposals, remarks, and criticism in a way that allows the expression of mutual respect toward one's negotiating partners. This cooperation must be constantly developed on the basis of social and economic development, particularly in working out the tasks and measures, and later the details.

Another important condition for a higher level of trade union activity is the requirement for greater emphasis on interest representation and protection than hitherto. We can and must expect that the activity of representing interests will become more complex and far-reaching because interest relations are now more complex. More attention will be paid to harmonizing interests and uncovering and solving conflicts. The circle of possible partners will expand and become more differentiated. We must, however, fight by means of work and management first of all to strengthen the protection and representation of interests.

We must look for the cause and the reason for the creation of the trade unions above all in the sphere of the protection of interests. The working class created the trade unions in order to protect and represent its interests. This has been, and still is, one of the central tasks of the trade union movement. The traje unions will be able to acquire an adequate mobilization, organization, and education influence only if they fulfill this particular task. This can also lay the foundations for their influence on the masses, their social prestige, and their international weight. Based on this and in the possession of this, they can endeavor, with chances of success, to win their members over and mobilize them for the implementation of social-political goals and economic tasks. Our lessons are unequivocal: there is no substantial trade union activity without solid work in representing interests.

Today, not only the experts but also public opinion is involved in shaping the fundamental issues of economic policy. The trade unions must bear this in mind in dealing with economic policy issues. It is clear to almost everyone that only the development of economic efficiency provides a chance for closing the gap and solving the contradictions of socialist construction. Accepting the main goal does not necessarily mean agreement in details. In carrying out their activity of information among the workers, the trade unions do not support views and goals that maintain antiquated relations and concepts. If they did that, they would harm precisely the fundamental interests of the workers and of society. The trade unions do not give a helping hand to factors that block movements that advance society. They cannot be indifferent to the interests and demands of the workers either. Thus, we can expect the activity of the masses to become the driving force behind socialist management and development. This, however, requires interests to be represented and protected in a way that is adequate to current needs. There are people who openly claim that only in helping economic activity can the trade unions be useful and not in the above way. This position is fundamentally false because interests energe on the surface in society anyway. One who does not take note of this is deceiving himself because "there are some who exaggerate and others who hide the problems." It is possible that this is not an adequate scientific argument but it is good enough to render the political essence perceptible.

The fact that the system of management will provide the production collectives with more rights in enterprise management than previously and that they will have a greater interest in the enterprise assets leads to considerable new tasks in many respects in the coming years. The increase in the rights of workplace communities will raise anew the question of relations between the roles of owners and employees and at another level. It is possible and necessary to strengthen the ownership and employee positions only one along with the other and not one against the other. The enterprises' economic leaders and bodies do not represent the employee rights of the workers as a whole or of a determined group of workers; they are not meant to. Therefore, the development of enterprise independence must go hand in hand with the increase in the trade unions' political and social weight. Any concept or measure that does not take into account a realistic employee attitude and the workers' reactions expressed in their work and political position can hardly be effective. Therefore, while we strengthen the transformation into a driving force of the binding element and activity of ownership, we must also strengthen the position of employees, too.

The existence of employee status justifies the maintenance of the particular role of the trade unions. The trade union continues to maintain its right to be the representative of workers living on wages and salaries. Its role and the area and form of its operation accords with the stipulations of the Central Committee Position of 12 October 1983, and the trade union exercises all those rights it possesses today too.

The increasingly emphasized direct method of central state guidance also provides the trade unions with greater possibilities. It represents new tasks and calls for an improvement in the trade unions' activity, particularly in the enterprises, at the workplaces. Because of the importance of the subject, it is worth mentioning separately the relations and cooperation between the enterprise management made up of elected members and the trade unions. Today it is too early yet to see precisely what new features and methods can be assumed by the activity of an enterprise management made up of elected members compared to the traditional one. The elected leaderships make employer-manager decisions and so the employer decisions of the enterprises they manage cannot do without trade union assistance and social supervision, either. Today, we still have little practical experience of the new elements in the cooperation between individual leaders and the bodies made up partially or completely of elected members. The system of cooperation between these bodies and the trade union bodies is now in the process of development. For this, we must provide a direction for the necessary activity in the near future.

The Improvement of the Economic Situation Is a Nationwide Task

As a result of the state of development, structure, and openness of the Hungarian economy and the weaknesses of our own work, Hungary is among the countries hard hit by the more difficult external economic conditions. Most of our products are of medium technological level and have become devalued on the world market while there has been a sudden increase in the price of raw materials and energy products. The deterioration of international political relations also affected Hungary and we must continue to take into account the discriminatory measures that are directed also against us. The burdens facing us as a result of the country's debts have brought tensions to the surface.

In the past years we have succeeded in developing and implementing an economic policy by means of which we were able to maintain full employment and avoid the drastic limitations that would have made the workers' life more difficult. The general consensus of society did not break, either, although the necessary economic measures severely taxed the population's tolerance. Like every achievement, this has also had a high cost. We had to allocate a considerable part of our national income to strengthening the foreign economic balance and as a result--as it is well-known--the investment possibilities were limited and the real value of wages and pensions decreased. Discipline slackened and the activity expressed in deeds became weaker in many places.

In the economic emergency situation of the past few years real wages decreased and the increase in consumer prices caused social tensions. The gap between justified demands and the ability to fulfill these demands widened. The problems increased and became more serious among the people living on small pensions and low incomes, families with many children, young couples, some strata of the intelligentsia, and people starting on their careers. The trade unions accepted the inevitable measures that had an unfavorable impact on the standard of living because this was the only way to maintain the balance of the people's economy. Economic changes have a profound impact on the people's attitude, on the activity in production and public life, and on the development of the system of values. The workers are striving to maintain the standard of living they have achieved in spite of the more difficult conditions. Many people feel that they are unable to create the income they need at their main working place and in their regular working hours. Therefore, they supplement the income they earn during 8 hours of work with extra working hours and often with activities that are far removed from their profession and training. This hinders both the better utilization of the human factor and the intensive economic development.

Thoroughly aware of the situation and the problems, the 13th MSZP Congress designated the acceleration of economic development in the coming years and then a gradual increase in the standard of living as being among the most important tasks. Since we cannot continue to reduce domestic consumption or prevent it from increasing, the material base for the further stabilization of the country's international and domestic financial balance must be created through the improvement of production efficiency and the acceleration of economic growth. Therefore, the main task to be implemented in the Seventh 5-Year Plan is to lay the foundations--while maintaining and strengthening the economic balance--for the increase in national income, technological advance, a tangible increase in the population's standard of living, and for the improvement of living conditions. In the coming years we must achieve a turn as regards quality and efficiency in the areas of industry and the building industry, transportation, and agriculture. According to the decision of the party congress, a program is being prepared for slowing down the rate of price increases; this is a very timely and necessary step. We must be careful, however, that these measures are not guided by the interests of distribution. Inflation causes materialized disturbances in production, construction, the supply of the population, in the lack of organization of procurement, and in shortcomings in services. An increasing number of people attain higher than average incomes only because society has failed to organize certain basic activities at all, or it organizes them very badly.

In the view of the Hungarian trade unions the decision of the 13th MSZMP Congress is right because it urges the development of a strategy for economic development that can ensure progress in the current situation. It follows from this that we represent and support with good conviction the goals formulated in the documents of the party congress.

We have well-thought out plans for changing the economic situation. A slower rate of increase in consumer prices can be achieved and so can continuation of a certain degree of price subsidization. By increasing the rate of economic growth, it is possible to increase the number of apartments under construction, mainly of state-owned apartments. We regard it as important to make sure that there is the necessary flow of manpower by maintaining full employment and that better efficiency leads to an increase in the security of existence.

To extricate ourselves from the current complex and difficult economic situation is a nationwide task and the most important cause of the working class. The trade unions also judge their own role on the basis of this task: they help and support the implementation of the tasks ahead. We must be clearly aware of the fact that we can attain the goals we have set out only if we succeed in creating order and discipline and increasing the level of our work in the way planned.

To Equally Accept the Rights and the Obligations

In the socialist society protecting interests and a siting production are indivisible functions, which are conditional upon each other and mutually strengthen each other. Jointly they express the trade unions' commitment to the construction of the socialist society and, through their joint implementation, they can fulfill their mission. Assisting production and promoting economic development is at the same time a protection of interest of decisive importance, just as the protection of interests is an essential driving force of production and economic development. This interaction does not reduce but rather increases the trade unions' role of protecting interests.

A trade union activity independent of our economic possibilities cannot lead to real success and cannot lead to an improvement in the standard of living. The framework of wages can be basically increased only by expanding economic possibilities. Forced increases lacking the above mentioned possibilities can lead to inflationary price increases or to increasing shortages. There is no point in fighting for agreements that do not have the necessary economic cover. Our honest aim should be to get more actively involved in the shaping and implementation of economic policy than hitherto.

An outstandingly important requirement for the trade unions is to help create the firm and constantly strengthening basis for the development of the security of existence, and in order to achieve this, to carry out their production-assisting activity in a renewed form and at a higher level. In urging the implementation of the current economic tasks, much attention must be paid to the new elements that are appearing along with the traditional helping activities. Such new elements are assisting in the changes of the product structure and the flow of manpower, urging the increase in professionalism, and making better use of competence. This means a necessary transfer of the main point; the trade unions have to support the inevitable changes in the economic activity and the successful utilization of new elements.

It is in the interest of every worker to help to improve the country's economic performance capacity, the technical-technological renewal, the structural transformations necessary in the economy, and the development of economic management. So far the enterprises have been unable to reveal thoroughly enough the resources inherent in the workers' activity. There are considerable unused resources as regards the modernization of the product structure, manpower management, and retraining and further training manpower. Our most important tasks are in work organization, work discipline, technology, the accelerated development of technological levels, its improvement, the use of three shifts, and in the uninterrupted operation of the machines. There are things to be done in every workplace. If we encourage and appreciate work well done and creative work and if we can attain the workers' collaboration in improving quality and organization, then we can place considerable development resources at the disposal of the economy.

As a result of distortions in the price system, relations of the "wage competition" among the state enterprises with efficiency are not close enough. There have always been and will always be wage competition. But they should not be extreme, that is, it should not simulate inflation. The development of manpower and income policy and the regulation of incomes and sources of income deriving from outside the basic workplace have become urgent tasks.

The trade unions attribute a considerable role to economic regulators in increasing the efficiency of the economy. A more readily calculable system of regulators that is valid longer is needed, a system of regulators that creates, through the central influence on enterprise investments, conditions for steady economic growth that does not threaten the domestic and foreign economic balance and which thus facilitates a better assertion of the requirements of planned development. Today, the enterprises' "eyes" are still often directed at financial management instead of the market. It is in our elementary interest to develop an enterprise activity in which enterprises can increase exports, imports, and last but not least, also the workers' income from the deserved surplus. The budget methods of economic management must promote this adequately.

The increase in the forms of operation listed in the category of supplementary and ancillary economy fulfills the demands of society; we must accept that the halt in the increase of the standard of living brought similar endeavors to the surface all over the world. We must learn to live together with these economic forms, we must make use of the advantages inherent in them, but we must also take into account the conflicts deriving from their operation. We regard it, of course, as our attainable goal to make sure that workers earn adequate incomes that ensure a good living in their main workplace. This, however, can be the result of a longer process--one that can be accelerated, though--and can be based only on a considerable improvement in work efficiency.

The majority of the enterprise workers' business partnerships carry out useful activity although one can also find among them phenomena violating our socialist concepts and system of values and our society reacts sensitively to these phenomena. Continuation of the enterprise workers' business partnerships is practical in every place where they fulfill real needs economically and at an adequate level; the distortions, however, must be trimmed. Their work must be made more visible for the workers and their activity must be analyzed, and the good experiences must be introduced everywhere. In solving tasks that are useful work for the enterprise, we must rely more on the socialist brigades.

We continue to need the socialist work competition as a particular form of the workers' activity, and we must not give it up for anything. Neither should we give up the concrete form of organizational activity represented by the socialist brigades. We have the opportunity of eliminating weaknesses, correcting mistakes, and reviving the movement. There is really a demand for this. It continues to be the main task of the work and competition movements to be the internal driving force of construction work, of the shaping of the socialist man, and of the higher-level activity of the workers living on wages and salaries. The participants in these movements should provide an example of how one can and must work according to today's demands and be concerned about each other and the interests of the community. For this, they must have independence and responsibility, both in the evaluation of performances, material and moral appreciation, and in choosing the forms and methods of the work competition. The small groups organized for independent manual and intellectual work have become a considerable factor of production all over the world, and collectives urging an improvement in quality are being organized at a more accelerated rate too. One must be aware of and use their experiences everywhere in production organization and in shaping a really encouraging local wage policy. We cannot forget for a moment that we can expect future services from the majority of people only if they feel steadily and tangibly that the value of their work is recognized.

Only a direct interest in the efficient utilization of the means of production can develop the sense of responsibility that society expects from the workers or finds lacking among them. The correct interpretation of enterprise democracy and the equal acceptance of rights and obligations are based on this responsible attitude. We must achieve a situation in which workers find "it is worth it" to accept responsibility and intellectual effort. This requires more independence, adequate scope for maneuvering, and opportunities for action. These things can mainly be assured by a well-functioning workplace democracy.

We must also create conditions for eliminating and limiting contradictions between the available possibilities and the inadequate practice. It is possible to achieve a faster development of these conditions but the results are closely related to the improvement in material and moral encouragement, the honor of work well-done, rational and at the same time demanding work organization, the competence and responsibility of the economic leaders, and to a firm stand against negative phenomena like indiscipline, poor quality, and complacent management which disregards the opinion of the community. The properly operating forums of enterprise democracy can play a great role in shaping the public mood and in arousing and maintaining interest in public affairs. The trade unions must find a way of ensuring that workplace democracy gets even closer to the workers, eliminates indifference, and attracts and promotes public activity. It should make it worthwhile to identify, participate in, and join the decisions and accept the risks inherent in every decision.

We introduced the system of collective labor contracts after the liberation. We thought at that time, and we continue to claim today that the mutual acceptance of the obligation of collective labor contract is not only a legal form but also a moral issue; both sides must carry out the stipulations of the contract. It is true that, due to the irregularities deriving from centralized management, there is considerable formality in signing and implementing the collective labor contracts, too. In spite of this, the collective labor contract is an achievement and has always been a weapon of the workers movement. Especially now, when the enterprises have more opportunities of determining their tasks and conditions themselves on the basis of their work, new possibilities have emerged for collective labor contracts; they can reflect reality more closely and can encourage both enterprise management and workers more effectively.

It is the firm endeavor of the trade unions to achieve--based on enterprise results and in awareness of the goals of society--as favorable collective labor contracts as possible for the workers and to renew them regularly;

to take initiatives in matters of living and working conditions and at the same time to supervise the implementation of measures concerning these conditions; to urge the formation of the enterprise welfare, social, and cultural funds and participate in supervising how they are applied. Negotiations on harmonizing interests must be made obligatory in all important matters affecting the workers. The economic management must be persuaded more so than previously that social security and care is an enterprise interest and an important means of strengthening identification with the enterprise, and lack of it can become a risk factor in our economic activity.

The collective labor contracts must reflect the principles and goals which we want to follow in the entire people's economy. As a result of the differences in local possibilities, the matter of collective labor courageously represent the workers interests without forgeting about the goals and possibilities of society.

The situation of the enterprises today is already multifaceted and it will be even more different in the future. Therefore, the possibility of signing industrial branch general contracts is worth considering. It has not yet been decided whether this should be a collective labor contract or a guideline, but it is absolutely necessary to help the enterprises in different financial situations and to guide them in the determination of their tasks.

The Seventh 5-Year Plan Is a Program of Well-Founded Development

The adopted Seventh 5-Year Plan is more than just one among the mid-term plans. Its outstanding importance lies partly in the fact that it must lay the foundations and ensure the long-term development projects in the current difficult times, and partly in the fact that it must be suitable for the elimination of social tensions. The Seventh 5-Year Plan is a program of well-founded economic development of increasing pace. An important condition for its implementation is that the government bodies draw the conclusion of the internal and independent causes for the lagging behind in the Sixth 5-Year Plan in their practical activity. The trade unions are glad to help in this endeavor.

The trade unions regard the following main features as important:

--Based on the balance requirements, the economic development will gradually increase compared to the average of 1981-85, and the standard of living will tangibly increase;

--Domestic consumption will not decrease further but will increase at a rate that is first close to the national income and later reaches it, and at the same time, the proportion of the consumption in production will also increase;

--The foreign and domestic balance of the people's economy will continue to improve;

--The economy will develop on the basis of intensive adjustment to the changes in the world economy, a thorough improvement in export capacity, and an increase in efficiency. In order to achieve this, however, there must be gradual progress in increasing the economy, including production, technological development, and income producing capacity, and in the proportional modernization of the infrastructure.

--A more efficient employment than hitherto will be implemented. The trade unions regard the assertion of efficiency as important. We must create the necessary conditions for the release of manpower. Full employment cannot be impaired and we must find ways of linking the two factors. The implementation of the plan for the people's economy basically depends on the enterprise plans, the enterprises' work and their performance capacity.

--The most important thing is that the enterprise plans must become the useful internal compass of enterprise activity and part of the concepts in harmony with the goals of the people's economy.

The preparation of enterprise plans is not a new task and the trade unions have become very experienced in how they should participate in this project. Today, however, the importance of this task has considerably increased. An essential factor is the extent to which the independent enterprise plan contains requirements accepted by society as a whole, and whether, at the same time, it attributes adequate importance to the necessary changes in product structure, has enough initiative, stresses enough the increase in efficiency, the expansion of exports, and whether it fulfills the requirements of the workers in the areas of living conditions and social and cultural development. The entire collective follows these elements closely, and therefore, the trade unions must mobilize their intellectual capacity and experience, and assert their sober value judgement to make sure that the enterprise plans can live up to all these elements. The workers must feel that it is important to have a say in shaping the enterprise and their own destiny already during the preparation of the plans.

The country needs the development concepts that present the future as soon as possible. We must decide on how much to rely on our own development and how much on imported licenses, how to select technologies that can be adopted in our country, what are the hopeful goals, on what we should allocate our scarce financial means and what should be the extent of the scope for maneuvering with these means.

Ventures worth billions of forints of the state programs would mean much more to the millions of workers if these ventures were presented to the entire society as individual big programs. The people's way of thinking, the economic management, and training could be adjusted to such programs. We think of programs that are capable of penetrating the heart and spirit of the masses and which provide prospects that encourage actions for the development of their lives and individual goals.

Stressing these things, we must not forget for a moment that socialist society provides much more than material or technical goods. This system revealed the deepest human values ever of the moral content of society, and set as its goal the constant development of these values.

The current economic conditions hamper the accomplishment and clear-cut assertion of the moral norms of the socialist life. The signs of selfishness, of the rapid spread of acquisitiveness, and of distortions of the human attitude increasinlgy irritate honest workers. To make matters worse, there is often a lack of appreciation for well-done manual and intellectual work, of honor for the man who learns, and of positive atmosphere for people willing to act for the good of the community, things that are in harmony with the policy and principles of our society.

Each Should Prosper According to His Work

That is precisely why we must do our utmost to win public opinion over in protecting socialist mortal values, in shaping new values, in defeating disturbances of values, in appreciating work and income from work, in creating respect for learning and the man who learns, in strengthening humanity, solidarity, and family relations, and in safeguarding love for one's workplace and the values of the community and of the individual. We must make public opinion our ally in the struggle against negative phenomena too, because it is unacceptable for people to be indifferent to phenomena alien to our society and honesty and which damage all of us, such as hoarding, acquiring income without work, and attitudes that are an affront to public taste, or the destruction ofpublic property. It is our firm intention to preserve the rank of work, learning, human attitude, and responsibility for each other and society. At the same time we take a stand against unfavorable phenomena and for the prevailing positive practice. There is hardly a well-intentioned, community-feeling, and prevailing man who does not support the trade unions in this endeavor. Our society basically agrees with the fact that we must defend and increase our socialist moral achievements and general human values in the same way as our economic goods or cultural heritage.

Everyday life openly discloses the most disturbing problems awaiting solutions. The tensions in the system of distribution and incentives and in the wage policy, the problems related to working conditions, the housing shortages, the relative backwardness of services, as well as the low level of health care are a source of several and increasing tensions.

The trade unions must simultaneously press for the solution of tasks that have opposing effects. They must defend the consumer interests of the workers and employees. The individual interests are related to the highest possible wages and the consumer interests are related to the greatest possible amount of goods purchasable with the wages earned. Full employment must be preserved, and at the same time, we must urge the efficient employment of manpower, outstanding incentives for best performances, and improvement of the living conditions of social groups living in the most difficult circumstances. At the same time, economic processes--understandably--make it possible only to increase wages and improve living and working conditions in proportion with work efficiency. The creation of the necessary amount of goods, preserving the country's solvency--and in connection with this--the regulation of the domestic consumption concerning the amount of wages that can be distributed urge the trade unions towards restraint.

The attention of the trade unions is now focused on making sure that work honestly carried out ensures honest living conditions; that the real income of constantly good workers and of people who fulfill the requirements increases. Turning the economy towards intensive development and increasing society's performance capacity must be connected for the benefit of differentiation and income according to work carried out. We must not be afraid of dissatisfied people who--because they are comfortable and professionally unprepared or unambitious--are interested in egalitarianism, hidden unemployment, and an apparent manpower shortage. We must listen to and ponder the voice of the people who demand better conditions for work, for the benefit of progress, and who are calling for the rationalization and better organization of production. We should be ready to support those people who do not regard wages according to performances as merely a slogan but are ready to give more of their skill and knowledge. These people represent the real voice of a workplace and its best effort, so we must pay attention to them and rely on them first of all. With intelligent, well-prepared management and lively activity in our movement, we must help to solve the difficulties and local problems with initiative, increased activity, with a demand for and maintenance of order and discipline. It is unacceptable to allow people who are animated by healthy impatience and readiness for action for the good cause to lose in debates and conflicts.

One of the finest tasks of our moment is the correct and consistent representation of the ideal of equality. This is an attractive goal, and for many people one of the brightest elements of the commitment to socialism. Nothing should be given up or withdrawn from it but, at the same time, we must make it clear that this is a long-term task and that equality implemented in the course of socialist construction cannot be limited to the distribution of existing material values and goods.

The requirements and tasks of creating equality and material goods cannot be separated in our views and our propaganda. The assertion of performance is indivisible from distribution according to work and from social policy. Social justice demands from everyone to work and be able to prosper and advance according to the work carried out. Our society should in no way provide shelter to anyone who could work but is not willing to. We must make a difference between people who are in a disadvantageous situation because of their own indolence and people who are in a disadvantageous situation as a result of circumstances beyond their control. We should provide possibilities for work also for the people who are capable of work in spite of their old age.

For the benefit of these efforts, the income proportions and the possibilities of wage increases should considerably depend on the realization of performance requirements. We must strive more in the future for justice in wages according to performance. Surplus income should derive from activity that is useful for the enterprise and society.

We must pay more attention to the situation of employee groups and enterprises which are in an unjustified disadvantageous situation from the viewpoint of wages through no fault of their own. We must develop an optimal difference between the lowest and the highest wages because unjustifiably large differences can hinder incentive in the same way that the egalitarianism that develops in cases of real differences in performance can.

We must promote the increase in real wages in the future in a way that makes sure that, in case of increasing performance, the real wages of certain employees do not decrease, either. According to the trade unions, an increase in income that exceeds the consumer price increases must be achieved in a way that assures the lowest possible level of the dynamics of consumer price increase. We must halt the decrease in real wages both on group and individual levels and we must force the inflation rate down.

In the current and future phase of socialist construction, wages and incomes develop differently not only according to professional training, probation time and work conditions, but also according to enterprises. The principled basis of the differences is the different activity, and different market value judgement of efficiency in various enterprises. A selective increase in wages and incomes is successful only if there are measurable and real considerable differences in performance recognized also by the workers behind the differences in wages in various enterprises. If other factors, like unjustified price increases or dishonest economic activity, have a part in this, it is the responsibility of the trade unions too to take a stand against these factors.

The trade unions regard it as particularly important that certain strata of people living on wages and salaries and certain professions and sectors receive increased material appreciation if they have a key role in making enterprises, sectors, and the entire people's economy catch up with international standards. We must also encourage higher wages for the best of the technological-economic intelligentsia, foremen, and workers. More attention must be paid to providing better material appreciation for young people at the start of their careers, workers employed under difficult and unhealthy working conditions, and workers employed in sectors with unfavorable working time and schedules different from the usual ones.

We must promote also by means of our wage policy the retraining for and directing to appropriate jobs of workers who cannot be efficiently employed.

The system of instruments of wage policy--primarily income regulation, the system of tariffs, and the central wage increases--must promote a more dynamic wage system for efficient enterprises than hitherto. With these measures the wage policy must succeed in achieving a situation in which there is a chance for every enterprise or employee to obtain an adequate wage increase if there is need for its work or his.

The key industrial sectors that will help the people's economy to catch up with international standards, and the decisive areas in the system of the division of labor should be given priority. Their importance and the increasing amount to risk should also be reflected in the incomes. In addition to the improvement of wages and incomes, there is also need for a more concrete and more efficient system of responsibility--primarily among intellectuals, production organizers, and foremen.

We must not give up efforts for the improvement of income and wage relations in other areas, either, but we should achieve this--with a few exceptions--not by preferences but by differentiating incomes according to performance and by eliminating unnecessary posts, and by distributing the wages released according to performance.

In wage policy, a greater role and more weight must be given to target projects. Although at present it is not possible to do away with automatically allocated benefits, more importance should be attached to already approved requirements, and financially it must be made more attractive to learn several trades both in theory and in practice. Within certain industries priority should be given to work requiring higher quality training, as against the unqualified jobs in mass production.

In the view of the trade unions, it is necessary that state agencies begin drafting a wage policy that is more complex in analyzing requirements and demands, and more detailed in outlining the principles to be followed. The unions intend to participate actively in this.

Let Our Social Policy Be More Demanding and Just

The housing shortage continues to be a cause for tension in the policy concerned with the standard of living. This is so, despite the fact that many new and modern homes were built in the years after the liberation, and especially during the past decades. However self-evident it may be, it must again be reconfirmed that the allocation of homes continues to be a task which receives prominent attention in the national policy; this is because a dwelling is a necessity; a home is required for human dignity and for a full life for all segments of the population, regardless of age and profession.

It is our opinion that more homes should be built than at present, and through this it is necessary to improve the conditions of housing provision. Where possible, more council-owned apartments should be built. An opportunity must be created for enterprises to use the incomes they derive from voluntary work and communist shifts to ease the housing problems of their employees. One-time and continuous charges must be set in such a way that young working people and their families do not have to limit their realistic demands and their recognized necessities for the sake of obtaining a dwelling; that they do not have to take on extra work endangering their health, give up self-education, further education, and cultural activities if they want to solve their accommodation problems. According to the joint decision of the MSZMP Central Committee and the Council of

Ministers, further improvements have to be made to the regulations of accommodation and housing policy to make it more in accord with our economic and living standard policy targets and at the same time meet human considerations.

Another serious problem in our lives is price development. We urge and are helping the elaboration of a price system that is more suitable to our price policy principles and therefore, again and again, we must consider how we can influence the price movement. The fact that wages do not increase in line with price increases is a great burden. Another source of impatience is that the cost of living can be covered less and less by incomes and social benefits. Experience shows that price increases impose great burdens on or reduce the consumption of certain groups of society, and could also create significant problems in running enterprises.

Working out an economic policy to reduce the increase in the price index affects the basis of consumer protection and confronts the trade unions with new tasks. Price increases implemented by firms--in many cases unjustifiably--made consumer prices rise sharply. In order to stop trends that force up prices, SZOT also has a wide range of tasks in sociopolitical supervising activity. It has to play a more effective part in working out the instruments of economic policy and constantly checking their operation in curbing price increases. In the view of the trade unions, it is necessary to reach a point where measures introduced to stop price increases will not create a growing number of goods in short supply. There seems to be a justified demand for trade unions to be more concerned with the pricing policy of enterprises, to be more firm with regard to errors in judgement that rely exclusively on spontaneous economic trends to curb price increases, and to set prices that meet the interests of consumers and that are based on real investment costs and on the relation between supply and demand.

In a more difficult economic situation, when incomes are increasing less and consumer prices more than desired, social policy merits special consideration and assumes greater importance, because it plays an important role both in determining the conditions of employees and in shaping public opinion. Trade unions agree with the political effort which requires social policy to adjust better in the future to our economic potentials and to be more just with respect to society. Therefore, based on the 13th MSZMP Congress resolution, the trade unions consider it important that we:

--restore the real value of pensions,

--reduce the family burdens of raising children by way of social benefits,

--create employment everywhere for people of redefined working capacity, [megvaltozott munkakepessegu] and in relation to this, increase the enterprises' minimum social benefit for employees.

It must be clear that disadvantageous social conditions cannot be eliminated in the present stage of socialist construction, but their occurrence can be made infrequent and their burdens reduced. A grasp of the situation will not leave us helpless. On the contrary, it will accelerate the process of solving these problems, they had a right to prepurchase goods at sales, or if shopping schemes were organized for them, or if they were allowed to have a temporal advantage regarding weekly or daily special offers. Doubtless it would be more just if these opportunities--not just those relating to food products--could be legalized and differentiated on a case by case basis. This would mean a lot of work, but it would serve a purpose worth the energy dedicated to it. The trade unions are on the own increasing care for pensioners in financial and other ways, such as taking more care of dealing with everyday matters, safeguarding their health, and preparing many opportunities for employment.

Vacations have been an important part of trade union activities for decades. Working people consider vacation as one of the most significant socialist achievements. Accordingly, vacationing--in proportion to our financial capability--has developed in many ways, become more varied, and shifted toward convalescence holidays and family vacations according to the members' demands. At present, trade union vacation schemes are the most inexpensive mode of recreation for employees. Thus, the trade union movement is fostering a solicitous concern for maintaining these schemes and further improving them, including improvements regarding the distribution of holiday tickets. However, we have to face many problems; above all, costs are increasing rapidly due to price increases, and at the same time--due to financial reasons--the government is gradually reducing its contribution.

We would not only like to maintain the present number of vacations, but would like to improve it in such a way that prices will possibly remain the same. Our intentions are clear. We are trying to mobilize our internal resources, because this has already proved to have been helpful in the past. The main guarantee would be to maintain the level of the state contribution, stop its reduction, and increase it at a later stage, but in addition, we would also like to resort gradually to enterprise funds. At the same time, we cannot refuse to slightly increase the fees for vacations and to introduce some differentiation based on the quality of holiday resorts and the income of people applying for vacations.

Our socialist state has obligations that cannot be ignored, and the fulfillment of which cannot be disregarded in spite of the economic situation, however difficult it may be. The government reduced the contribution it appropriates for cultural assistance and only slightly increased its support for vacationing while--due to inflation--maintenance costs of our holiday resorts and cultural establishments increased substantially. Funds intended for holiday homes do not cover the cost of maintenance. During the past 4 years, maintenance costs of cultural establishments increased by some 30 percent and fees for performers, books, and technical equipment increased. In view of the present building costs, there is no hope for maintaining the conditions of educational establishments.

There has been a debate every year at conferences with competent government agencies over the extent of the state's contribution. We will suggest that the government ensure the stable value of cultural grants and stimulate the amount for vacationing for several years in advance. Unfortunately, for a long time to come neither the trade unions nor enterprises and the government will be able to provide a sufficient amount of money for vacationing. It also has to be considered that--precisely at this time—members' demands have increased substantially. Thus, as soon as the country's economic situation permits, we have to take more efficient steps to further develop the construction of holiday resorts and to improve the organized vacationing scheme.

It is impossible to avoid the task of improving the quality of health care. We support every public action that contributes to protecting health and improving patient care and health services. It is a natural and traditional task of the movement to nurse sick people at home, provide for the elderly, take care of them at home, and ease their financial, physical, and emotional burdens. In many fields of health care it is necessary to better utilize finances and existing possibilities, to provide human assistance, and to assert the acceptance of responsibility toward others.

Public collaboration can help us to advance in the prevention of diseases and reduction of dangerous phenomena and dangers to human health and the environment. It has been an integral part of trade union educational activity to develop and maintain a healthy way of life. The trade unions can do a lot through their regular and purposeful advisory activity for improving people's state of health, and for reducing such addictions as excessive smoking, alcoholism, and the spreading abuse of drugs. It is not only the interest of the individual, but of the immediate and wider community as well, to show determination against such dangerous addictions, because many people are ruined or unable to work due to physical and psychological deterioration, which is also the cause of innumerable wasted talents and broken families. Alcoholism and drug abuse are at the same time hotbeds of crime.

The basic interests and demands of working people remain unchanged: to improve working conditions, safeguard health and physical education, further develop working and living conditions, and increase their social security.

For the sake of their health and the prevention of diseases, employees should use the opportunities and equipment at their disposal for physical education and sport.

Through their activity in leading and shaping consciousness, trade unions are to take initiatives for helping and improving physical education, sport, and tourism. It will be the most important task of the coming years to consolidate achievements attained so far and to continually improve them according to national goals. The sport and touristic programs organized by trade unions are to suit the interest of the membership. It is desirable that these activities involve the mobilization of young people, families, socialist brigades, and the adult population.

We Increase the Movement Character of Our Activity

It is our duty to increase significantly our relationship with the masses and further improve the movement character of our activity. At the same time, relying on significant achievements, we must improve trade union activities. We have to attain strong progress in the work among social strata [retegmunka] and provide conditions for a manifold, independent, and initiatory activity at the level of basic organizations. It would be good if the 25th Union Congress made a decision to increase the movement character of our organization and internal operations and to strengthen our relationship with the membership and the millions of working people.

We have to seek--and together we shall find—a way to reduce the formal characteristics of our work and to diminish bureaucratic ties and the official aspects of our appearance.

We must achieve a situation in which the stewards, trade union committees, agencies at the intermediate level, and the branch trade unions in each case adopt, together with the members, a standpoint and a decision as regards the most important issues. It is necessary always to know the opinion and ideas of employees as regards possible solutions. It must become the norm to issue correct and constructive reports on matters discussed. These are all central elements of our work ethic. The members' knowledge of trade union activity is influenced to no small degree by our relying on and working together with the masses in shaping our everyday work, opinions, statements, and decisions. The most important thing is that the stewards always discuss the issues with the group beforehand. This work makes extra reports superfluous, and the joint activity helps to develop firm foundations for our movement, and a firm relationship with the masses, and is the way for them to identify with our aims.

In trade union groups, activity is to be based on independent work and initiatives involving all members. The goal is for the groups to form together suggestions concerning peace and social benefits, to decide together about the purpose and methods of the workers' competition, and analyze their performance on their own. The group should be entrusted with the work concerned with wages, work competition, discipline, behavior, encouragement of education, the acknowledgement of industrious people who are performing and studying well, and with providing assistance to less able people showing an effort to improve. This is the real, down-to-earth, and everyday mass activity, and at the same time it means organization and education. At all work places greater scope should be given for the expression of group and individual interests. It is necessary to make all the people concerned be completely aware of the complexity and entirety of and the need for coordination. If this is achieved, they will not feel that there is "higher" or "outside" interference in the process.

More attention should be paid to individual problems and everyday matters, and also to the shaping of individual ways of thinking, the changing of behavior, and to increasing general education. This should be especially so now, when requirements have grown amid our towering economic difficulties and in all spheres of our lives.

The members should have more opportunity than today to nominate and elect their own trade union leaders. In preparing personal assessments, preference is given to suitable training, independence, ability to initiate, and commitment. What is required is the further perfecting of methods to improve the mechanism of selecting and electing trade union leaders. There should be more emphasis on leaders' training, sense of responsibility, and competence. Small, competent, and independent apparatuses are needed. It is necessary to strive to have a situation in which independent leaders receive most of their support from the debates and work analyses of their own boards. This should also apply to constructive [erdemi] supervision.

Since more and more questions concerning the life and work of [words indistinct] important for basic organizations to effectively help employees work out their position. Basic organizations should not be left on their own in dealing with the enterprise leadership, which possesses the right to dispose all moral and financial means. Regional trade unions and central state agencies should provide more help in solving questions which affect public opinion (traffic, goods transport, health, education and so on). The latter bodies should assist local organizations by providing information, education, advice, useful decisions, and directives, and by taking stock of experience, as well as ensuring that local organizations can advance and reach the level resulting from enterprise independence. First of all, this will require a new and different type of work. For practical purposes it is desirable that branch organizations issue no rigid patterns for action, because such patterns would not serve well in view of the manifold and various forms of enterprise activities.

In the future it must be ensured that the stewards' activity remains the fundamental trade union function among workers. Trade union committees are to discuss with the stewards or the board of stewards the questions that apply to the entire collective. Wherever there is a board of stewards, in the future it should also be regarded as the highest authority of corporate trade union activity. Trade union committees must build up a system of regular business, a way to deal with, inform and educate the stewards. They should create better conditions for stewards and boards of stewards to work more effectively and constructively on behalf of employees and to be bolder in assessing the leaders' performance. If problems are more complicated, the solutions must take all aspects into consideration such as all economic, organizational, and human aspects alike.

Branch trade union organizations, county trade union councils, and the Budapest trade union council are to solve the tasks previously decided on jointly, individually within branches, responsibility, and according to suitable standards; they are to mobilize the know-how and capability of their activists, functionaries, and even of their entire membership as stipulated or suggested by the SZOT; and are to point out the rate and methods of fulfilling the tasks according to the particular characteristics of their area. Leaderships of central agencies are to help the basic organizations in their activities but they should not take upon themselves the entire operational management. They are to increase their role in exploring and representing the interests of their members. They are also to fulfill a kind of "legal supervision." It also serves practical reasons if branch organizations set up a staff of highly qualified experts both in the apparatus and within the network of social activists.

County trade union councils are to participate more extensively in drawing up and mobilizing the implementation of regional development issues. By doing so, they are to arrange suitable cooperation with industrial and branch trade unions and local trade union organizations.

The highest trade union authority is the SZOT. It fulfills the role of corporate management, assures the independence and responsibility of branches, provides conditions required for high quality work, and stipulates the movement's most important targets, duties, and the trend of activity. It is the duty of SZOT to adopt positions concerning questions of principles and the development of trade union work. It regularly prepares assessments of and disseminates practical experience. It is the national representative of all members in the country. It has a substantial part in drawing up economic, cultural, and political programs and in making decisions. In decision-making in the future it will rely more on the experience and information of branch trade unions, and prepare detailed analyses of specific problems related to individual branches.

Regional SZOT agencies coordinate the local activity of branch organizations. The rights and responsibility of local authorities are increasing and this will greatly affect the employees' living conditions. Therefore, regional representation of interests must be strengthened and this requires more rights for county trade union councils and intertrade committees.

Leading bodies are to base their work schedules, attitudes, and activities on valid decisions, and on the experience and demands of the masses. They are to increase the board members' analytical ability and willingness to debate matters, as well as to strengthen the creative atmosphere of board meetings. They are to concentrate on the tasks that lie ahead, and encourage views to be expressed in a new, demanding and responsible manner.

The trade union press must provide regular information for members; and gather, reflect, and pass on even to the government the opinions and problems of the membership. The SZOT Presidium has at its disposal a suitable decision concerning the system for passing information downward and reports upward, but the system is still being implemented irregularly, and often with a low standard and only formally. It is not possible to explain tasks and have them accepted and understood without a reliable degree of information, and without this information we cannot motivate people for action.

We must be bolder and more critical in representing the interests of minor groups. In order to display the manifold interests of employees, it is necessary to establish alongside leading bodies working committees, which would summarize and express within the trade union movement the interests of particular groups of employees. If we do not accept this task, or are not able to fulfill it, sooner or later interests will find other forms of representation outside the trade union. The SZOT needs voluntary assistants, who--as members of permanent class councils [retegtanacsok], or perhaps permanent or temporary working committees--possess the independent right of making proposals, assessments, and suggestions. Boards of professional experts and activists should form one kind of a guarantee for representing group interests. With the help of these boards, much more active and varied work should be carried out among intellectuals, young people, and major trades.

The Best Investment Is Know-How and General Knowledge

According to their vocation, organizations and movements that consider themselves responsible for the progress and state of society are to support the general education of the masses and the development of cultural life in accordance with our political line. The trade unions must consider the main features of our cultural life today and expect achievements, shortcomings, and other effects that can influence their cultural and educational activities. There must be a more determined effort to make this activity reflect the characteristics of their activities in other areas. In the future trade unions are to participate more effectively in shaping our cultural life, spreading culture, carrying out high-level and effective political propaganda and agitation, and providing help for self-education and for establishing small cultural and educational communities.

Difficulties that developed in the standard of living and problems of social tension were detrimental to public education and culture. In certain strata of the population increasing extra work and the low standard of services in some places reduced free time and the time available for general cultural activity and high-standard entertainment and recreation, while in other strata of the population, due to increasing financial problems, less money was available for cultural activities. At the same time, prices of cultural products and services increased, and this affected above all the employees in low-pay categories.

It coincides with these phenomena that the mental and emotional conditions for economic renewal could not fully develop among employees, and at certain points this proved to be an obstacle to expanding our economic efforts more rapidly. Our economic results are not as yet adequate for creating more financial resources for improving cultural services that are today confronted with high demands. Many of the demands--not only with reference to living standards, but to education as well--ran ahead of feasible and satisfactory standards.

Our nation's standard of political culture provides the guarantee for passing acceptable judgments and participate in the fulfillment of the approved political line. However, there is yet a lot to do to increase activities in political and public life. Our society cannot live without the workers' contribution to improving public life. It is important that within suitable limits and conditions--especially among workers--we further improve public activity and the readiness to engage in politics. We have to create and utilize a variety of more exact instruments for education, teaching, and propaganda in order to let workers use more boldly and efficiently the possibilities in public activity at their disposal and those that will still develop later.

Know-how, education, and an individual who is learning and advancing culturally are the most rewarding investments and the most profitable capital spending, because the profit returned will be a better understanding of labor and the general system of values in life, the pleasure of knowledge, and more human dignity. Knowledge is the treasure of the individual and society alike. We carry out a representation of interests in the most noble sense of the words if we subject our thinking and all our influence to this purpose. The more meaning we give our work and the more we master our situation and fulfill our role, the better we may serve the many millions of our membership, our society, and our people who are constructing socialism.

Though we are all aware of generally increasing demands for a better and more cultured life, we do find in many of the firms and institutions that work is of a low standard, that there are shortcomings in the work ethic, and that discipline is slack. As consumers, we require good quality, but as producers we let even meager-quality products leave our hands; regarding personal matters, everybody expects more attention from those who surround them, but at the same time many people are indifferent toward their fellow men and sometimes toward the life, situation, and problems of their families. It is obvious that these contradictions cannot be reduced and wiped out by merely shaping consciousness or issuing a series of measures. Their elimination will require complex collaboration and harmonious governmental and social activity.

In past years, while concentrating on solving other social tasks, we have paid less attention to developing the thought and feeling of belonging together both in the family and society which provide the basic influence on communities. Processes have developed which are in themselves very important, and could easily undermine the bases of all community sentiment and of human responsibility. Here are the roots of most of our problems as regards the education of youth, as well as many of the problems concerning working places and residential areas, the loosening relations between friends and colleagues, the deteriorating general norms of morality and behavior, and of our poor taste.

Traditions of the Movement in Vocational Training

Our whole educational, cultural, and artistic activity has been hindered and weakened by imperfect knowledge of history, decreasing interest in education regarding the mother tongue and literature, and by decreasing and overshadowed [hatterbe szorit] human resources that generally help develop moral, behavioral, and emotional culture. This problem became especially serious with regard to the current and the future generation of tradesmen. The above-mentioned shortcomings became most apparent in vocational training schools and institutes. It is necessary to find out the causes of this problem and at the same time work out the tasks that will help change this situation. Urgent action is needed, because the value and meaning of humanity and humanitarianism are all the more important. The socialist society must be built on the firm foundation of labor and humanity supporting each other. Even in the field of international life, the right to exist and the future belong to such humanitarian thoughts and ideas as the desire for peace, friendship among nations, and internationalism. We are convinced that a particular people can carry out successful activities in serving these noble ideas and humanitarian intentions only if it steels itself with a clear national awareness and realistic self-knowledge.

We are all aware of how the trade unions participate in handling the affairs of education, teaching, culture, and ideology. They help the activities of the party and state jointly with other social and mass organizations and by sharing these tasks according to their own characteristics. They will do so in the future too, but will have to be more determined in using opportunities that are inherent in the movement's character and in harmony with sociopolitical functions.

Trade unions are also a significant force influencing the working atmosphere and operational conditions of educational and art institutions and editorial officers. In the future trade unions will have to study more thoroughly demands regarding particularly important questions and matters which, above all, affect the great masses of working people; and they will have to express more clearly the position of trade unions and, of course, have to support the fulfillment of those demands that are considered justified and realistic enough. This activity presupposes improving our qualifications and developing our ability to adopt an overview. It is necessary to always represent our opinion on an adequate level in order to assume a more efficient role in shaping the policy of general education. It is an equally important task for us to further perfect and better operate the trade union movement's system of means, and form the activities and attitudes of the movement as regards education policy, general education, and art.

It is of national economic interest and, at the same time, a task of strengthening the cultural features of collectives that trade unions provide more help for socialist brigades, keep abreast of new tasks, and influence people more intensively among themselves and in the community as regards education and the shaping of attitudes. Trade unions are to help unfold and strengthen enterprise democracy with all possible means at their disposal. They are to provide help in increasing the role of particular working communities within enterprises, and are to express their views with regard to production, social, moral, and cultural questions directly affecting collectives and influencing enterprises.

With reference to our trade union press, we can do more to enrich the internal life of the movement and increase general education and artistic culture through the following: concentrating more on the use of information and propaganda means, and making a greater contribution with our schools, continuing education courses, research resources, and book publications.

Looking back to early traditions of the workers' movement, it is worth recalling that the movement--under completely different social and political conditions, and in addition to daily information and agitation work--was successful in influencing the workers' ideological and moral behavior in taste, life style, and more or less their entire life in the right direction; the movement was also able to create a more humanitarian and healthy working ethic. If we explored more deeply the everyday life, interests, emotions, and tastes of working people, we would certainly find important tasks for the movement which could make more natural the trade union's propaganda and public educational activity.

The society cannot reach the level we set as a target for the country's future economic and cultural progress, unless basic classes and strata of the population have reached a higher standard in their everyday life, taste, way of thinking, and behavior. Therefore, promoting this development is a task for the entire society, a matter for the whole nation which requires collaboration on a wide scale; we must keep this in view when we talk about education. In this context, the key issue is clearly a matter of increasing the professional and general knowledge of workers, reducing the existing discrepancy between trades and segments of tradesmen, and reducing the unjustified differences in the level and modernity of training.

Vocational training--at least of popular trades--cannot be considered satisfactory with regard to professional requirements. This situation is aggravated by the already mentioned insufficient general education and knowledge of the humanities, and by the poor level of teaching as regards general knowledge. All the shortcomings in training, teaching, and education hinder the setting of justified requirements for tradesmen. This must certainly be improved. Our movement must also set an example in this matter, just as it did in the past: We have to provide more help to responsible state agencies and, in certain cases, have to find a way of stimulating state organizations, employers, enterprises, and factories. It would be an important step if we could achieve all this through mutual efforts, to bring vocational students and most excellent tradesmen closer to each other during the period of training and practical work in factories. The subjects would be more realistic and attractive, and the contact made would be profitable, both professionally and in terms of human relations. The source of this profit can only be the knowledge, humanity, honesty in trade, and experience of older masters. It would serve to strengthen and improve the relationship of masters and youngsters if the trade union groups and committees in enterprises and factories were to exercise more decision making in appointing the trade instructor dealing with teaching and practical training. This position should not only be decided by the council authority, the school, or the enterprise administration, because in many places this is the reason why children are not taught by the best tradesmen. For young people the ties between an experienced, "old" tradesman and the workers' collective could prove a convincing example of the irreplaceable advantages of belonging to a community.

The intellectuals are playing a growing role in shaping the sense of belonging to a community and in shaping the cultural face of the residential environment. Corporate trade union bodies and regional trade union agencies have to do more to create a situation where lively public activity becomes a natural way of living among intellectuals, and of course, to make it possible for the trade union's cultural and general educational activity to find a firm foundation in professionally and politically committed intellectuals. The trade unions have to devote special care to ensuring the more reliable professional, political, and ideological development of intellectuals.

Our society does not rely on working people only as producers and consumers, but as well informed and politically educated citizens with a wide intellectual horizon. We must emphasize this today especially, when one of our most important political efforts is to increase the democratic features of our socialist society and extend democratic rights and opportunities.

An indispensable part of our cultural and public educational work will continue to be the spreading of the most important economic, political, artistic, and generally useful knowledge. We have to deal with this old task by searching for new methods and attractive opportunities. We must rely on the real interests of citizens and enterprises, and call upon this state of interestedness, because only thus do we find--can we find--any meaning and attain results in disseminating knowledge by means of the movement. We know from experience that there is no success otherwise.

We must strive not to separate the trade union movement anywhere from the cultural and general educational activity. Cultural activity should penetrate all segments of the working people, have the character of a movement, be free of bureaucratic elements, rely on voluntary work and independent initiatives, and have an organizational structure characterized by democratic principles.

One must consider the establishment--under the auspices of trade unions--of political-public activity clubs and groups that would provide more scope for increasing the public activity of greater masses of working people. Thus, working people would be given the opportunity and the chance to establish direct contacts, regular dialogues, talks, and debates with experienced, well-prepared personalities from public and intellectual life. This could strengthen the relationship between the trade union movement and intellectuals taking an active and responsible role in public activity and, at the same time, would promote the establishment and stabilizing of autonomous communities [kozossegek].

We are convinced that in our public and cultural activity we must rely much more on the interests and demands of working people. Concerning the content and methods of this work, we must get significantly closer to the movement's character and efforts, and must pay more attention to the tasks and demands of society and the nation.

The Basis of International Cooperation Is Knowing and Respecting Each Other's Work

A wide range of active work, as well as manifold and diverse relations are characteristic to the international activity of Hungarian trade unions. Above all, we develop close ties with partner organizations in socialist countries, but we also pay enough attention to the European capitalist countries and states of the developing world. Based on mutual interest, we intend to continue with cooperation, mutual understanding, knowing each other, and dialogue; it is our firm intention to declare always and everywhere--wherever necessary--the solidarity of trade unions and of the working people in Hungary.

Of course, our international activity is not undisturbed. At the end of the 70's and the beginning of the 80's, the "cooling down" of political relations also affected the trade union movement. The trade unions of several capitalist countries--not knowing exactly the opportunities and the work of the workers' movement in socialist countries--express unjustified reservations about our operation. The kind of behavior trade unions should adopt under extremely complicated political and economic conditions is also a matter of dispute.

The present trade union movement has experienced a crisis only through books. Today's trade union leaders were not in office at the time of the great world recession in 1929. Recent years have somewhat "spoiled" the trade union movement in capitalist countries. In most capitalist countries the situation was favorable at the time of the economic boom, and better partner relations were established with employers and governments. The strength and authority of the trade union movement increased and nearly everywhere it was able to attain significant achievements for its membership.

Concerning our international relations--but especially those with socialist countries--we have to deal more with the changes that have taken place in the role of trade unions in capitalist and socialist countries, because in this respect our theoretical work is weak, even though today it is the precondition for sensible and serious international dialogues. At present, problems are growing due to the economic and political situation in the world. The capitalists not only upset the consensus limiting their economic efforts, and which has already been uncomfortable for them, they also endeavor to break the strength of trade unions, reduce wages, radically cut public spending, and cut back the minimum central assessments on profits. The nightmare of unemployment is a warning to trade unions to present more moderate wage demands all over Europe, even in countries run by governments considered leftist. The shock of economic crisis, the feat of a more disabled economy and of complete economic collapse has turned the owners of small and large capital equipment, the capitalists, and in certain places employers as well, against the wage demands of trade unions.

In capitalist countries, several leading trade union officials admit that their successful strategy of the 60's, which in welfare states--by using the institutions of socialist partnership and cooperation--modified the distribution in favor of employees, have now proved to be a failure in the years of international economic crisis. Other difficulties were created by the changes that took place in the structure of capitalist societies. New working groups appeared due to technical development, while the number of workers in large industries, the traditional basis of the trade union movement, decreased. The trade unions had to admit that it is beyond their strength to undertake a change in government policy and again increase public expenditure. In short, the situation of trade unions has become more difficult in capitalist countries.

Today it is of great importance to coordinate trade union activity at one point--also internationally--in order to better serve the interests of members. However, to do this well enough, we have to decide our tasks with a clear understanding of the situation. Coordination will be truly undisturbed if we know and respect each other's principles. Today, no national trade union is able to set out its aims without knowing the situation, conditions, and interrelations of the whole of Europe.

Knowing each other's opportunities, we should set up mutual tasks together and act together accordingly. Taking only small steps, it would be possible to get out of the present difficult situation of trade unions both in capitalist countries and in our homeland. It would be necessary to use new methods, and in certain cases adopt a new course, because the trade union movement has become too pragmatic. The intellectual capacity is not sufficient, because what we read about the trade unions is almost exclusively written by bourgeois philosophers. This kind of low-tide reasoning and theory are not favorable for progress. We cannot even carry on an in-depth argument. We cannot explain our thoughts in detail and cannot express differentiated concepts. It is high time to urge onward intellectual life and overcome fainthearted reasoning.

We know that trade unions in developed capitalist countries bear a great burden of international tension. In any case, we must consider it a positive development that during the past half decade no step has been taken such as was the case with the breach in 1949. Our bilateral relations were not interrupted. These trade unions, despite their difficult situation at home, did not turn against the trade unions of socialist countries, including the Hungarian trade unions. As regards bilateral relations, Hungarian trade unions wish to expand relations with trade unions in capitalist countries. Since 1949, the greatest test of our relations has been caused by the Polish Solidarity. We let them express and explain their own views at all forums and congresses, but we defended and made known our own position as well. Even in this case, the condition for dialogue and for forming a possible mutual standpoint was and will remain a matter of understanding each other and of respect for the other's opinion.

Nothing is stationary, everything undergoes a transformation and we are living in years of change and challenge. The trade unions have to form a realistic image of the situation with regard to both small and global world problems and, in order to solve them, they have to assess the extent, ways, methods, and systems of their necessary efforts. International trade union centers and all individual trade unions have to adjust to new requirements. The international trade union movement also has to give answers to the questions put forward, and this can be helped by mutual consideration and collaboration.

I think relations can be improved if we openly discuss our own problems. A possible subject for joint consideration could be the method of harmonizing various aspects as regards efficient employment and the welfare aspects of part-time employment, flexible retirement age, and the social policy of enterprises. We think it would be especially important if trade unions were to cooperate and discuss issues concerning health protection of employees, as well as a healthy way of living, and cultural education. Useful cooperation could be established through the exchange of tourist groups, which could be accompanied by discussions about trade union tasks. Cooperation is to increase in order to discuss and spread the knowledge of theoretical problems facing the trade union movement. The knowledge attained in this connection could certainly help the development of a trade union strategy that could lead the fight and activity of trade unions more efficiently than today.

Instigating war-psychosis is an important aspect of anti-working-class, anti-trade-unionist attacks. Increasing the tension among states with different social systems--especially since the end of the 70's--is a method that is used to increase the pressure on trade unions under the pretence of calling for "national unity" in order to face some kind of "external danger." The cold-war atmosphere is also revived in order to cause division among workers' parties and trade unions and, by means of increasing military expenditures, attacks against workers' social and economic rights are more intensive. In the atmosphere of war-psychosis, it is easier to employ legislative methods and administrative measures for the sake of pressurizing trade unions and depriving them of their right to the most effective, penetrating forms of attack. The monopolies' offensive, the revival of rightist forces, the danger of militarism, and the attempts to halt the trends of detente interfere with the interest of not only the working class, but of the entire society.

The vital issue of trade unions is the battle for peace. The trade unions are aware that either war or peace is of vital importance to the whole of mankind; and they also know that the age of detente--contrary to the years of cold war--creates better conditions for their own battle and also for the mutual relations of various trade unions. A very fine example of this is the trade union solidarity rallies against Nicaraguan [as published] or, recently, against South African oppression, but here we can also list such mutual future tasks as improving the situation of women, youth protection, and the subjects of guest-workers and environmental protection. Trade unions could act together in combatting hunger, not only in Africa, but in all parts of the world, by using the organizational facilities and apparatuses of the international trade union movement, both in collection and distribution. This would increase the weight of trade unions in international politics, and at the same time would increase the authority of trade unions in developing countries.

As regards the international relations of Hungarian trade unions, just as before, great importance will be attributed to the trade unions in socialist countries--first of all in the Soviet Union--as well as to the World Federation of Trade Unions.

During its long history, as well as in the past 5 years, the World Federation of Trade Unions always played an important role in the daily struggle of workers and in expanding international solidarity. According to the 10th Trade Unions' World Congress, this body analyzed the fundamental changes in the 80's, and tried to renew its concepts, methods, and working style with the aim of increasing its work efficiency and of understanding more the everyday problems of employees.

We belong to those within the World Federation of Trade Unions who urge its renewal, and lash its slow mechanism and its occasional bureaucratism. We also support political renewal and flexibility. We support a high degree of independence in expressing one's opinion in debates, especially with reference to specific international political matters; but we relentlessly and steadfastly call upon all member unions as well as all other trade unions to act on a class basis in safeguarding the cause of peace, disarmament, detente, and above all workers' interests.

Let Us Join in Both Thought and Action

Many of the aims of old battles have been realized up to now. We are constructing a society which provides people with security, helps them develop, and constantly stimulates them to achieve more and to do something better. We have been working hard for our achievements and did not receive them as presents. What we are still able to achieve and create for ourselves depends on us and on the quality and efficiency of our work.

Socialism is the society of labor, thus, it is our aim to let everyone prosper according to his labor. Nobody should receive a higher income without, or with very little, work. It is necessary to create an atmosphere in which those employees and leaders whose performance is good, are honored and promoted, and in which people are ashamed if they do not exert themselves, and thus also face the financial consequences of their bad and undisciplined performance. We can and must debate on how we can distribute the produced goods; the quantity of produced goods, however, is not a matter of debate, but a factual matter decided by the administration and production. Therefore, assisting production is the condition for the trade union's role of representing interests.

Our tasks and problems today are not smaller but, in certain cases, even greater compared to those in recent years. Workers understand this. In order to stand our ground against increasing economic, political, and ideological pressures, and reduce our homeland's economic burdens, the struggle for better quality work and efficiency will increase. In this struggle the determining factor is the behavior, confidence, and performance of working people.

In their own area of competence, trade unions will help sensible and useful efforts that are able to serve our economic and social aims efficiently, and are able to create conditions and circumstances for establishing daily working hours and for providing for honest labor. It is of great importance to grant the workers' ideas attention and fulfillment if they apply to improving performance. There should be no workplace where irresponsibility, negligence, and waste are not criticized.

The way the social role of the trade union develops is inseparable from the trends within our entire society. It cannot run ahead, and it must not trail after events. Social conditions today are favorable for the trade union to fulfill its role, in fact, the conditions in our society urge the more self-evident emergence of the trade union's independent role. The movement is persistently looking for suitable means and methods of carrying out high-standard tasks.

In the struggle for our aims, we have to rely more on the strength of the membership. It is not enough to expect the membership to understand things and act, but their voice and opinion must also be regarded. All this requires honest and open debates, and needs the involvement of the members' masses in daily trade union activities. To unite in both thought and action is the appeal of the 25th Congress to all working people, to all who consider that the cause of our homeland, the cause of socialism and of other people, is their own cause as well.

RCP COMMITTEE ASSESSES JARUZELSKI VISIT TO ROMANIA

Warsaw ZYCIE WARSZAWY in Polish 9 Dec 85 p 7

[Text] Bucharest (PAP). Maciej Kuczewski, PAP correspondent, writes of the proceedings of a meeting of the Executive Political Committee of the RCP Central Committee. During the meeting President Nicolae Ceausescu gave information regarding the working visit to Romania of Wojciech Jaruzelski, the first secretary of the PZPR Central Committee and People's State Council chairman.

The Executive Political Committee stated that the visit brought about a new and important event in the development of relations, friendship, and cooperation betwen the RCP and PZPR, as well as between the Romanian and Polish peoples. It was stated that discussions between the party and government leaders were fruitful and confirmed the desire for continued Romanian-Polish cooperation in political, economic, scientific-technical, and other areas.

Various points were emphasized such as the special importance of economic relations between Poland and Romania, the establishment of new forms and methods of cooperation beneficial to both sides, the advancement of production cooperation, and the growth and differentiation of trade exchanges. Within this context the importance of the recently signed protocol concerning the coordination of Polish and Romanian national economic plans was emphasized. The protocol foresees a growth in exchanges, cooperation, and production specialization between the two countries over the next 5 years.

The Executive Political Committee emphasized the importance of the exchange of views on current international problems by the two men, both of whom are government and party leaders in their own countries. The Executive Political Committee also emphasized the importance of the confirmation on that occasion of the Polish-Romanian decision to actively cooperate in the international arena toward solving the great problems facing humanity, to further control the arms race, especially nuclear arms, and to create the atmosphere of peace, security, detente, and cooperation in Europe and in the whole world.

Taking into consideration that which was agreed upon during the visit, the RCP Executive Political Committee recommended to the government, the ministries, and other central organs that all necessary action to correctly implement the Polish-Romanian partnership and cooperation agreement be taken. SWEDISH IMMIGRATION BUREAU ADVISES RETURN OF BOYS

Warsaw TRYBUNA LUDU in Polish 7-8 Dec 85 p 2

[Article by Waldemar Kedaj: "The Polish Boys Should Go Home; The Final Decision Rests with the Swedish Government"]

[Text] (From our correspondent in Stockholm) The influential Swedish newspaper SVENSKA DAGBLADET published an article entitled "The Bureau of Immigration Wants to Send Polish Boys Home" in the Thursday morning edition. The story, also picked up by the evening television news program, reported the position taken by Thord Palmlund, head of the Swedish Bureau of Immigration, concerning the case of two juvenile "refugees" from Poland. The two "refugees" are 15-year-old Adam Z. and his 13-year-old brother Krzysztof. Mr. Palmlund acknowledged that "children not of legal age should remain with their legal guardians", in other words, with their parents.

Even while expressing that opinion, the immigration authorities did not, however, make a final decision. The final decision in this "sensitive matter", as they termed it, was left to the Swedish Government. According to paragraph 69 of Sweden's Refugee Law, the Bureau of Immigration may abstain from making such a decision if warranted by "special considerations".

Local newspapers have tried to inflate this unusual escapade to the north into a political sensation. However, doubts concerning the affair which began in October were not completely dispelled and thus brought to the attention of the Ministry of Labor. According to the SVENSKA DAGBLADET, more than 1,700 applications for asylum in Sweden are waiting for government review. Gerhard Wikren, director of the department of foreign affairs, informed the Stockholm newspaper that they have not yet reviewed the matter, because it was only received on Wednesday. However, he assured that a review will take place "in the most urgent manner possible."

The same newspaper has reported extensively the Polish Government's demands for the return of the two brothers, detained in Sweden contrary to international law. The newspaper also published the assurances of Jerzy Urban, media spokesman for the Polish Government, that the boys face no sanctions from the government and their schools upon their return. According to the reporter, the Swedish Ministry of Foreign Affairs has refused comment on the Polish Government's response.

COMPARATIVE VIEW OF GOVERNMENT CONTROLS OVER ACADEMIA

Warsaw RZECZPOSPOLITA in Polish 4 Dec 85 pp 1, 7

[Text] USA, Sweden, India--University Autonomy Limits

Washington, Stockholm, Delhi (PAP) (C). The amended law concerning higher education, which has recently taken effect in Poland, and the resulting legal proceedings in universities present us with the opportunity to compare the university systems in other countries.

In the United States, for example, where there are more than 500 private and state colleges and universities, the basic source of academic laws, rules and regulations, by-laws, and academic-didactic programs are university councils. Membership includes representatives of practically all communities and "interest groups" connected with a given university.

However, the greatest characteristic of universities in the United States is that representatives of all institutions which donate funds for the upkeep of the institution have a degree of influence at the university. Thus, industrial corporations, banks, important financial institutions, and social organizations are represented. The influence on the choice of university authorities is proportionate to the financial contribution of these institutions. The same is true for individual contributors, known as funders.

Therefore, those deciding the personnel composition of university leadership are extremely varied. Not only someone from the ranks of professors but also a representative of the main funders can be chosen director.

In the majority of American universities, the president is chosen on a competitive basis. As a general rule one's academic and didactic work, and especially one's management and organizational experience are the deciding factors. Many times the so-called industry captains, people who possess enormous experience in managing huge business organizations, become university presidents.

In Sweden there is a system which is considerably more orderly and centralized in effect. According to Swedish legislation, all university workers, both academic and administrative, are considered government employees. The universities are "agencies", that is agents of the central authorities.

Therefore, they lack autonomy and their own jurisdiction. The limits of these institutions' autonomy, including academic, commercial, and financial-administrative matters, are precisely defined by regulations and resolutions of the parliament and the government, or by the local authorities if they are authorized to do so by the government.

Government authorities in India exert a direct influence on university activity. In the Indian system, the state governors or other high representatives of the government administration also hold the position of university president (chancellor). The university is run by the president through a vice president of his choosing. The central authorities go to great lengths to defend the universities from the influence of the opposition. It is for this reason that state governments dominated by opposition parties have relatively little influence, if any, in the appointment of university positions on a nationwide scale.

SOCIOLOGIST DEFENDS YOUTH AGAINST APATHY CHARGES

Warsaw ZYCIE WARSZAWY in Polish 6 Dec 85 p 3

[Article by [M.K.]: "Voices from around the country--They Love Democracy, but..."]

[Excerpts] In the GAZETA POMORSKA Ms. Maria Mossakowska, M.A., a sociologist from the Academy of Social Sciences speaks of research on the topic of "The State in the Social Consciousness of Youth:"

--"I carried out research of a representative sample of youth age 15 to 19, from rural and urban backgrounds from all over Poland who were either studying or working.

From the questionnaire, it appears that in general, youth love democracy but are in favor of a wise leader with a strong personlity. They keep a great distance from all institutionalized democratic forms of administration. They are convinced that everything depends on those at the very top.

The input of citizens on the government is limited to the Sejm and People's Councils. Incidentally, the Sejm has the highest degree of trust, and is mentioned first in governmental democratic institutions.

In answering the question as to when Poles demonstrated responsibility for the country's fate, the majority mentioned World War II. The participation of the citizens in rebuilding the country after liberation, and people's attitude during the time of the crises, and martial law were not noticed to a large degree.

Youth are unable to distinguish a few concepts. 'Democracy', 'equality', and 'justice' mean more or less the same thing to my respondents. They cannot render these concepts into tangible aspects of our governmental system.

On the other hand, our youth markedly identifies with the nation. In response to the question "If you were to be born again, into which country would you like to enter the world?" Poland is mentioned ten times more often than the majority of countries from which they could choose. I think that this fact best refutes the damaging accusation of youth of being nihilistic and apathetic. We should blame ourselves rather for mistakes made in their education and upbringing."

ACADEMIC SEES NEED FOR BETTER WORKER-MANAGER RELATIONS

Warsaw ZYCIE WARSZAWY in Polish 6 Dec 85 p 3

[Text] The following quote of Prof Stanislaw Polaczek of the Institute of the National Economy is from a conversation with Marek Formela, which appeared in the columns of DZIENNIK BALTYCKI on 29 November:

"A method must be found which would allow workers to indentify themselves with the workplace. I am an advocate of a decentralized economy, although in such conditions the business is still more inclined to think only of today's profits, and to forget such things as future prospects, technical progress, and similar matters. Not until there is a stable relationship between the workers and the workplace is it possible to avert economic shortsightedness and repair work productivity.

I wonder if it would be possible as our system evolves to create the opportunity for workers to possess stock in their companies and to participate in the division of profits. This does not mean that workers would obtain shares of stock gratis. Stock would be acquired gradually by the company paying the worker his portion of the profits in certificates stating his shares of company stock rather than in cash.

Of course, the majority of the company's stock would remain the property of the nation. However, in this way the workers would become co-owners of the company and collectively would be concerned about the company's future. At present, everyone from the director to the cleaning lady gives the impression that they have nothing at stake in the company."

PAPER REPORTS ON KOMSOMOL, YOUTH IDEOLOGY SEMINAR

Warsaw TRYBUNA LUDU in Polish 9 Dec 85 p 3

[Text] The Youth's Outlook on Life

The Commission for Joint International Contacts of the Polish Organization of Youth and Students and the Leninist Komsomol held a ideology seminar a few days ago in the Baltic Youth Center in Sobieszewo near Gdansk. The seminar was dedicated to the formation of a Marxist-Leninist outlook on life among the young.

The organizer of the seminar was the Youth Center for Secular Culture, affiliated with main administration of the Union of Socialist Polish Youth and the Society for the Promotion of Secular Culture. We asked Mr. Zenon Wasilewski, director of the Youth Center for a few words on the topic of the seminar.

--As far as I know this was not the first seminar of its kind...

--In the past 2 years we have had five Polish-Soviet meetings devoted to issues connected with world outlook. During the last one we exchanged our experiences in the patriotic-internationalistic and atheistic upbringing of children and youth. Papers devoted chiefly to these issues were delivered. In addition, we talked of youth participation, both current and theoretical, in the implementation of the PZPR and CPSU programs and in the preparations for the upcoming congresses of both parties. We talked of utilizing the output of the 12th World Festival of Youth and Students. We devoted much time to the issues of rest and free time of youth. Thus, the program was quite full.

--The exchange of experience should serve a purpose. What purpose did it serve in this case? What is the tangible effect of the seminar?

--We presented the output and achievements of our Youth Center of Secular Culture to the participants who found the subject very interesting. They were also interested in the results of sociological research done by the Research Center for Youth Problems of the Union of Socialist Polish Youth's Main Administration and the Institute for Research of Problems of Youth of the Office of the Council of Ministers. They suggested that our center undertake a comparative analysis of results concerning changes in the world outlook attitudes of Polish and Soviet youth. That is one result of the meeting.

Further, we agreed that we will exchange educational materials, helpful in the dissemination of Marxism-Leninism. Our studies will be gathered among others by the Komsomol Academy in Moscow, Soviet studies will be sent to our center.

The participants were interested in propaganda concerning world outlook education. We showed mainly what the youth press is doing, which they liked. And while we are talking about the press we boasted of the award we received from TRYBUNA LUDU. They received this news with acknowlegement and... incredulity, because this award brings with it enormous dignity, especially since the center has only recently been active.

Returning to common interests, we in turn were interested in information on experiences in the field of secularizing work. Soviet comrades spoke interestingly on many subjects including the work young communists have done with believers. Information about Young Atheist Circles in schools in which the young members themselves and not outside leaders organize activities was also interesting. These activities are not just lectures and discussions but also meetings enriched by films, recitations, and similar things. It makes for an attractive formula.

While we are on the subject, the formula of our Polish youth circles of the study of religions is based on the Soviet method. We knew that somehow we had to do this but did not know exactly how. After a number of seminars we solved the problem without difficulty. Thus the results of the seminars are certainly not limited.

--This means that certainly you are going to continue with them...

--We decided at the last seminar that we are not only going to organize the exchange of groups of speakers, but also we are going to prepare further joint sessions. We want to devote the next sessions to such issues as ideological-educational work among working and peasant youth as well as among high school and college youth. Beyond that we intend to discuss new socialist organizational ceremonies.

The participants accepted the Polish proposal and began organizing an international session for next year entitled "Youth and Religion in Conditions of Real Socialism." Seven delegations from socialist countries will take part in it..

And because there can never be enough study and experience, we intend to broaden our contacts also. We are organizing for next year another bilateral meeting with representatives of the FDJ from the German Democratic Republic. In addition to that, we want to begin cooperation with the SSM organization of Czechoslovakia and the KISZ organization of Hungary.

Marek Rudnicki took part in this conversation.

ACADEMIC QUOTED ON INTERRELATIONSHIP OF ECONOMICS, POLITICS

Warsaw POLITYKA in Polish 16 Dec 85 p 2

[Text] The following is a quote from Prof. Dr. Kazimierz Doktor, director of the Philosophy and Sociology Institute of the Polish Academy of Sciences:

"...is the issue of autonomy in the economic sphere. Our experience to date seems to indicate that this is one of the key issues. The question that remains is exactly what kind of barrier to create and where to place it in order to defend the economy against intruders and amateurs?

The search for such a clear line of demarcation between economics and politics is doomed from the start to fail. The two are too strongly intertwined in socialism. Thus, one can only undertake scientific research to find out how these two closely connected ones function and malfunction. On the other hand, public opinion would certainly rather the two spheres be separated further. In practice anyway, one can notice that the political apparatus has presently distanced itself somewhat from the economy--even if only because a political trade union apparatus did not exist for awhile. In addition, many positions of secretary for economic affairs do not exist even today. This situation is present in various organizational levels of the party. Even the party headquarters has slightly fewer cells dealing with the economy. Changes in this sphere have occurred. However, I do not think that it will ever come to a situation in which there would be two "pure" subsystems--economic and political--and one common system connecting the two." (From a conversation with Piotr Grochmalski in "Wprost" on 20 November.)

RESEARCHERS EXAMINE SELF-MANAGEMENT ISSUES

Self-Management Examined

Warsaw ZYCIE I GOSPODARCZE in Polish 3 Nov 85 p 8

[Article by Pawel Ruszkowski: "In the Realm of Self-Management"; passages enclosed in slantlines printed in boldface]

[Text] In April 1985 the Public Opinion Research Center conducted a sociological study of the actual influence of the self-management bodies on the functioning of the authority mechanisms in enterprises. Those studied covered 334 randomly selected enterprises. In each of them the respondents were the chairmen of the workers' council, the directors, the first secretaries of the party organizations, and the chairmen of the union organizations.

This study produced much data on the range of the self-management's influence on decisions concerning crucial issues for enterprises, the range and form of cooperation with the other bodies in the enterprises and with the social and political organizations. It has established the social membership of the workers' council and evaluate the relationship of the particular socioprofessional groups in the enterprises to the self-management, the degree of the council's independence in making decision, the influence of the branch lobby on the range of the self-management's actions and competencies, and the forms of the self-management's cooperation between enterprises.

From this collection of issues analyzed in the study, we will select two, which we believe to be most important currently: /the range of influences and the forms of cooperation with other bodies and organization within the enterprise and the form of external cooperation./

The Range of Independence

The respondents sent a list of 29 areas essential to an enterprise and a request to describe what the self-management's role in decisions in these areas was in 1984.

In the opinion of their chairman (13.7 percent of the representatives) the councils have their greatest influence on the division of enterprise income into accounts (10.2 percent of the respondents), the method of distributing the profits for rewards to individual workers (15.6 percent), membership in an association (12.0 percent), disposing of machines and equipment (11.1 percent), financing technology and innovation clubs (22.8 percent), awarding medals and plant diplomas (12.6 percent), making recommendations on state awards (10.5 percent).

This influence is noted by the three other groups of respondents. With the exception of item number 6, 5.1 percent of the directors, 6.2 percent of the first party secretaries, and 7.1 percent of the trade union chairmen agreed. But they felt the council chairman overstated their case.

The self-managements had moderate influence on issues of production plans and other important production decisions (18.3 percent), the financial plan (13.8 percent), investment policy and modernization (12.9 percent), division of enterprise income into accounts (24.9 percent), the method of distributing profits for rewards to individual workers (23.1 percent), establishing work rules (12.9 percent), plant agreements on wages and work in the enterprise (19.5 percent), premium regulations (24.5 percent), the workforce's social and material conditions (13.8 percent), giving awards and plant diplomas (12.6 percent), making recommendations on state awards (15.3 percent), improving work organization (12.3 percent).

The council chairmen noted moderate influence levels in 17 percent of the enterprises, directors in 12 percent, first secretaries in 9.9 percent, and trade union chairmen in 8.3 percent.

Characteristically, /council activists rated their influence on the enterprise's functions higher than the other participants in the decisions./

The area beyond the councils' influence includes fields in which no decisions were made in 1984 or decisions made without their input.

In 1984 according to the council chairmen, in an average of 60.1 percent of the enterprises in the survey no decisions were made on such issues as naming a director (76.9 percent), naming assistant directors (56.3 percent), making significant changes in technology (63.2 percent), evaluating work norms (56.9 percent), use of mass communication (57.2 percent), cooperative agreements (55.1 percent), export agreements (55.1 percent).

There was agreement among the directors (53.2 percent), the first party secretaries (46.1 percent), and the trade union chairmen (43.8 percent).

The Range of the Directors' Influence . . .

The areas all respondents regard as the directors' domain include key strategic decisions in production levels, directions of development, distribution of incomes and profit, and external relations.

The conflict of directors' and self-managements' influence in these areas can be illustrated by the division of profits for individual awards. In 43.4 percent of the enterprises the council prepared its own proposal but only 15.6 percent of the councils' proposals were adopted. However, 23.1 percent settled for making corrections in the directors' proposals.

/The flow of information between councils and directors/ is crucially important for their relationship. An indication of good relations is the free flow of information about the enterprise's condition and the initiatives undertaken by both sides./ The clear majority of directors (79.4 percent) conveys all current information significant to the management of the enterprise to the council, but they do so--in the opinion of the council chairmen--according to their own views (21 percent) or on the express request of the council (36 percent).

The directors transmit materials for meetings at an appropriately early time 85 percent of the time; the councils provide the directors with information on their plans and projects in 88 percent of the enterprises. Directors do provide materials at the last moment preventing proper evaluation of them (39.3 percent).

The council chairmen stated that in more than half the enterprises the director or his representative participates in preparations for council decisions.

. . . party and trade union organizations

The interests of the party and the council cross in two issues directly and indirectly influenced by the council: giving awards and plant diplomas and making recommendations on state awards.

The council chairmen's answers to direct questions about other issues on which they asked for party help included in some enterprises: wages (9 percent), mutual contacts (6.6 percent), production (5.7 percent), social and material conditions (3.8 percent), and planning (3.6 percent).

Party representatives participate in council meetings in 58.7 percent of the enterprises; in 30.5 percent they participate at the council's request if the meeting includes issues of significant interest to the party; and in 5 percent (according to the first secretaries 6 percent), they do not participate and are not invited to participate.

The council presidium prepares material for meetings with the party executive's advice in 27 percent of the enterprises.

Mixed commissions with party representatives are active in 66.5 percent of the enterprises.

The forms of contact also show the party organization's method of influencing the council. /Informal contacts, conversations with council chairmen,/

play a significant role. The secretaries believe this is usually the case 85.7 percent of the time, and 61.6 percent of the council chairmen agree. Party members on councils are another form of informal contact. The secretaries said this occurs in 87.7 percent of the enterprises. The council chairmen agree (51 percent).

/In nearly one-quarter of the enterprises (23.4 percent), the party organization declines to exert direct influence on the councils. Their real representative of their interests on the self-management council is the enterprise's director./

Areas of conflict between the councils and the trade unions include the workforce's social and material conditions and methods of distributing profits for awards to individuals.

/Trade union representatives usually participate in all council meetings in 50.6 percent of the enterprises; in 39.8 percent they are invited to participate if the agenda includes issues of interest to the trade union; in only 3.9 percent they neither participate nor are invited to participate.

Mixed commissions with trade union representatives exist in 69.2 percent of the enterprises.

Trade unions communicate more formally (in writing) with the councils with greater frequency (59.1 percent) than the party organizations do. Official presentations of the trade union position at council meetings is required in 64.5 percent of the enterprises, which is the same as for party organizations.

At times the directors present the trade union position just as they do the party position to the councils. According to the trade unionists this occurs frequently or always in 22.2 percent of the enterprises.

External Relations

The dynamics of self-management depend primarily on the constellation of social, economic, and political factors inside the enterprise and near it and far from it.

/The absence of direct exchange of information between self-management councils of different enterprises practically prevents improving the system. Hundreds of councils commit identical errors, fall into the same legal, economic, or bureaucratic traps because what they know of others activities they read about only in the press (ZYCIE GOSPODARCIE, TYGODNIK ROBOTNICZY)./

Initiatives of the national councils to organize meetings between self-management councils, without proper acquaintance with the situation were taken as efforts to "cap" the local self-managements. Some of the activists fear contacts with territorial self-governments will lead to increased pressure for the enterprise to subsidize the city, districts, schools, nurseries, retirees, etc.

Efforts to increase cooperation under Sejm patronage are also worth considering. The commission on worker self-management has gained substantial recognition during the creation and activation of workers' councils. Perhaps smaller consultation meetings in addition to the national meetings would be appropriate.

The existence of a strong, active Sejm commission on self-management is one of the more important guarantees of the development of self-management according to the proposals adopted at the Ninth Party Congress.

Research Shows Self-Management Weakened

Warsaw POLITYKA in Polish 9 Nov 85 p 5

[Article by Jerzy Hausner and Jerzy Indraszkiewicz, researchers at the Economics Academy in Cracow: "A Little Ostentatious"; passages enclosed in slantlines printed in boldface]

> [Text] In 1984 there were calls to change the statutes on state enterprises and worker self-managements. These proposals caused concern among the activists in the self-governments. They remembered the negative effects of the changes made after 1956 in the regulations of self-managements. Officials declarations that the measures of 1981 would be retained were welcome.
>
> But . . .

The stabilization of the legal situation was accompanied by decisions in some administrative divisions /weakening the self-governments' position and limiting its prerogatives./ This was shown by the following:

/Creating new legal regulations/ whose contents conflict with the statute on enterprises and self-governments. The activists in self-government regard the statute on plant wage systems as an example of this situation. This statute, which makes the director and the trade union the partners in the wage agreement, gives the self-government a mere advisory role.

/Creating interplant economic organizations/ depriving the enterprises in them of their independence and their self-governments of prerogatives. This applies especially to mining and energy enterprises.

/Violating the binding regulations in practice/ Reports of violations by the various levels of the economic administration have become so common that the problem is being investigated by the Supreme Chamber of Investigations. This investigation showed that 18 percent of the enterprises investigated had violated the right of the general meeting of the employees (delegates) and 36.5 percent the workers' councils' prerogatives.

These facts were not reported appropriately in "Report on the Implementation of the Economic Reform in 1984." In our view, the report improperly assigns the problem only marginal significance. The self-management activists are unable to counteract effectively these actions. The self-governments possess formal legal protection of their rights, and the most effective method is recourse to the courts. /However, the self-managements seldom employ this method. As of 31 March 1985, barely 52 cases had been entered./

Why do the self-management activists accept weakening of their position? In our opinion, among the causes of particular significance are /the relationship between the founding body and the enterprise, the low level of the activists' legal knowledge, the lack of support for their actions be legal advisors, and finally pressure exerted on the activity who are professionally subject to administrative demands./

Another problem is the absence of self-government bodies. According to Prof. Baka's last report, /they did not exist in about 13 percent of the enterprises./ Since the workers' self-government is to exist statutorily and function in every enterprise, their absence in any enterprise violates current law.

Areas of Conflict

An important area of self-management activity is confirming annual and multiyear plans. The study shows, however, that the council's participation in planning is purely formal in most enterprises. /It consists primarily of accepting the general premises of the plan presented by the administration./

All too frequently, /current problems of enterprise operations predominate at the cost of discussion of long term solutions/ at the meetings. A similar approach occurs in the councils' monitoring activities. They deal with fragmentary, current questions and seldom involve comprehensive evaluation of economic efficiency.

The short term orientation and waiting for change from outside and above can be explained by the absence of effective methods of cooperation between the councils and administrations, problems with access to information, the lack of sufficient experience among council activists (which is caused by their short terms in office). These explanations, however, are insufficient.

A dependency relationship develops between the founding body and the enterprise, which although formally in accord with the reform in reality contradicts it. /The founding bodies exploit the parametric management instruments (for example, rate reductions) as directives. The enterprises in fact lose their economic independence and self-financing character, although formally they remain independent./ This significantly affects the self-managements' position and capabilities. Some activists are critical of the founding bodies' procedures, but these activists must remember the "criticized" can affect the enterprises' financial condition. Which is better: partial loss of independence--though guaranteeing the enterprise a better situation--or defending their independence--though losing significant support? This dilemma is especially apparent in the self-managements' attitude toward the founding bodies attempts to create large, interenterprise economic organizations. A delegate to the Fourth All-Polish National Conference of Representatives of Workers' Self-Management stated" " even if an enterprise is quite profitable and has a relatively high net profit in order for it to assure its workforce wage raises near a level balancing inflation, it must have rate reductions and preferences. And these are easier to obtain in a combine." The conference showed that many of the activists in self-management have decided in favor of reform, enterprise independence, and an important role for self-management. Will these activists yield to the realities of the world?--we cannot be sure.

Inevitable Opposition

/Cooperation of the councils with the party and the trade unions causes much controversy./ Establishing these relations requires everyone to take on new roles. The party and the trade unions must alter their traditional methods.

Observations confirm that party organizations are changing their methods in most enterprises. The members' interest in their enterprise's condition has grown; interest in affecting the consciousness is greater, but it frequently lacks the element of partnership and effective cooperation with the self-management. The Public Opinion Research Center's survey has shown that one-quarter of the party organizations have resigned from direct cooperation with the self-managements and act through their directors. Open conflict between the party and the self-management occurs infrequently.

/Relations between the self-managements and the trade unions are significantly complicated./ Many statements emphasize the unclear division of responsibilities as the source of the conflicts. This is an oversimplification. A number of conflicts exist between these organizations. /They are rivals for society's support and legal prerogatives; there are personality and prestige conflicts; they compete over the distribution of various services and awards in the enterprise, wages, and the operations and development of the enterprise./

The source of the first two conflicts lies in past political events. The increasing peace in politics and the development of the trade unions should cause the competition in political categories to disappear. The tensions caused by personality and prestige and the distribution of services can be relaxed by signing cooperative agreements between the councils and the trade unions. As yet few such agreements have been signed in the enterprises and the range of cooperation has been limited. This contributes to conflicts in the distribution of social funds and making recommendations on awards or trips abroad. The directors and party organization require an opinion from the trade unions, and these recommend only their members.

Distribution of the national income and wages are becoming increasingly salient issues./ The self-managements must strive to relate workers' wages directly to their productivity and work quality and to the enterprise's financial condition. They must also insist that the decisions be made in the enterprise. The trade unions, however, accept the branch's role, within which the decisions on wages and work are to be made./ This approach leads to group agreements as the basis for wage and benefits within the branch that are to be specified in social agreements within the enterprise.

Group wage agreements are the object of current analysis and preparation for legislative measures. The government has reservations about this union conception and wishes to avoid the further spread of branch social services and privileges. The self-managements' further opposition to this approach is natural. Adopting these measures would transfer economic authority to the ministries or associations, limit the enterprise's economic independence, and make them dependent on the founding bodies.

The last mentioned source of conflict must be evaluated differently. Taking into account the different status and functions of the self-managements and trade unions in the enterprise, which result from the dual role of the worker (as co-owner and employee), we must regard such conflicts as understandable.

/In conclusion, we believe that problems in cooperation between the self-managements and the trade unions result from the trade unionists slowly coming to understand their role in the self-managed enterprise and not a sign of their inevitable opposition./

False Evaluations

The intensity of discussion of self-management has declined. The opinion that they are developing properly is beginning to dominate, supported usually with arguments that there are a large number of activists, conflicts in their operation have declined, and the number of cases before the courts is small.

These arguments do not get to the heart of the matter. Rather, they concern secondary issues and conceal the real measures of the self-managements' position. /Such measures are, for example, their ability to require responsibility from the managerial staff, their influence on productivity, and the workforce's participation in self-management./ These aspects point toward a more skeptical judgment of self-managements' accomplishments and prospects.

As yet no self-managing attitude has developed among the workers. This failure is due to be many weaknesses in self-management. External factors play a more important role than the internal operations of the enterprise in producing the passive attitude./ The condition of the labor market, the imbalance on the market, and inflation seriously hamper the transformation of the workers' consciousness. They cause the workforces to disintegrate and weaken their interest in responsibility for the enterprises' financial condition./ The inflation distorts the merit wage system, which instead of raising productivity compensates the workers for inflation and stabilizes employment.

HISTORIAN QUESTIONS DEMOCRACY-HAPPINESS EQUATION

Warsaw POLITYKA in Polish 9 Nov 85 p 2

[Excerpt from "Opinions" column, taken from a conversation with Piotr Gadzinowski in ITD on 20 November]

[Text] Prof Dr. Jan Baszkiewicz, historian: "A democratic society is not the highest form of happiness. Those that say that it is less mobile are right. Theoreticians of democracy agree that this sytem is not efficient and quickness in decisionmaking is desired. Tocqueville, who understood democracy very well, explained that it does not provide the most efficient government, but it encourages a social liveliness, and a release of social energy that makes up for the various disadvantages of inefficient management. Mass participation in the social life strengthens society and prepares it for difficult hardships. At the same time it is a society that has much to lose and is able to fight energetically for the value system already in effect."

SCHAFF BOOK ATTACKED AS ANTI-POLISH, FALSE

Warsaw POLITYKA in Polish 23 Nov 85 p 2

[Excerpt from "Opinions" column, taken from NOWE DROGI, No 10, 1985]

[Text] Marian Dobrosielski: "I think that the significance of Schaff's views presented here is so clear to Polish party members that it requires no comment. Schaff boasts that his book has already been published in a few western languages. But by doing so his book contributes to the propagation and strengthening of negative stereotypes about Poland, Poles, and the establishing of socialism in our country. Stereotypes his book promotes were created by enemies of Poland and socialism. What is astounding in all of this is that the person who so openly warps the views of Marx, Engels, and Lenin has the audacity to call himself a Marxist and a Communist and also to maintain that this type of criticism and call for "renewal" serves Marxism and communism. I have never been one to use labels or slogans. However, I believe that complete justification can be found in the views and methods presented in Schaff's book "The Communist Movement at the Crossroads" when in finishing I state that it is anti-Marxist, anti-Leninist, anti-Soviet, anti-Poland and anti-party on the subject of the PZPR. If the communist movement were to follow the road shown by Schaff it would be misled and end up in a quagmire."

COUNCIL OF STATE DECREE ON MINISTRY OF FOOD INDUSTRY

Bucharest BULETINUL OFICIAL in Romanian Part I No 772, 27 Dec 85 pp 1-6

[Council of State Decree No 392]

[Text] DECREE OF THE COUNCIL OF STATE
on establishment, organization, and operation of the Ministry of the Food Industry and Purchase of Agricultural Products

The Council of State of the Socialist Republic of Romania hereby decrees the following.

CHAPTER I

General Provisions

Article 1. The Ministry of the Food Industry and Purchase of Agricultural Products is hereby established, as of the date of this decree through reorganization of the Department of the Food Industry in the Ministry of Agriculture and the Food Industry and the Department for Procurement Contracting, Purchase, and Storage of Agricultural Products, which are hereby abolished.

Article 2. The Ministry of the Food Industry and Purchase of Agricultural Products will implement the policy of the party and state in the area of the food industry and in the areas of formation, procurement, storage, and marketing of state stocks of agricultural crop and livestock products and formation and storage of state agricultural food product reserves.

Article 3. The Ministry of the Food Industry and Purchase of Agricultural Products will act as a central coordinating authority for activities in its sphere which are performed in units subordinate to other central or local state authorities and for the activities of cooperative and public organizations.

Article 4. The Ministry of the Food Industry and Purchase of Agricultural Products will direct, guide, and monitor the activity of the industrial central agencies and other units subordinate to it and will be responsible as plan administrator for implementation of the plan in its sphere of activity.

Article 5. The Ministry of the Food Industry and Purchase of Agricultural Products will ensure application in its activities of laws, decrees, and resolutions of the Council of Ministers.

Article 6. The Ministry of the Food Industry and Purchase of Agricultural Products will cooperate with the other ministries and central authorities and with local authorities in performance of the functions assigned to it.

CHAPTER II

Functions

Article 7. The Ministry of the Food Industry and Purchase of Agricultural Products will perform chiefly the functions established by the present decree.

SECTION I

Functions in the Area of the Food Industry

A. In Connection with Industrial Processing of Agricultural Crop and Livestock Products

Article 8. The Ministry of the Food Industry and Purchase of Agricultural Products bears full responsibility for the industrial processing of agricultural crop and livestock products, along with better utilization of raw materials and improvement and modernization of production technologies, for which purpose:

(a) It is responsible for carrying out the assignments of the unified national plan of socioeconomic development, at the established performance levels, and for drawing up and carrying out development programs in the sphere of the food industry.

(b) It ensures and is responsible for ongoing development of activities relating to industrial processing of agricultural products, diversification of food product assortments, and improvement in product quality, for the purpose of meeting the consumption needs of the population and other requirements of the national economy.

(c) It is responsible for superior utilization of agricultural raw materials, introduction of new technologies, lowering specific consumption, rational use of production capacities, and introduction of advanced methods of organizing production and labor, so as to increase labor productivity and economic efficiency in industrial processing units.

(d) It prepares development studies and programs for the food industry, taking into account trends and tendencies throughout the world in technical development; draws up draft annual and long-term plans, as well as special programs for products, product groups, and activities, on the basis of its own research and recommendations submitted by subordinate units.

(e) It elaborates programs for full and more efficient use of production capacities, and throughout the year monitors utilization of the equipment, plant, and labor of industrial units.

(f) It is responsible for sound management of the meat resources in state reserves, for ensuring the production of meat and prepared meat products, and for full and superior utilization of livestock products and by-products and production of a variety of meat products and prepared meats.

(g) It monitors the status of livestock slaughtering in slaughterhouses, irrespective of their subordination, and is responsible for compliance with the provisions of the law regarding slaughter weight and number of animals scheduled for slaughter in accordance with the plan.

(h) It takes measures to ensure development of processed and prepackaged prepared foods, on the basis of scientific nutritional standards.

(i) It is responsible for the industrial processing of milk and superior utilization of milk, and for preparation of dairy products with varied nutritional values in keeping with requirements for rational nutrition of different categories of consumers.

(j) It organizes, directs, and monitors fishing in the Black Sea and in oceans, as well as pisciculture and fishing in inland waters pursuant to law, industrial processing of fish and other aquatic products, improvement in the quality of processed fish products through strict compliance with manufacturing technologies and formulas, and increase in the amounts of fish processed and delivered fresh to the public.

(k) It ensures industrial processing of wheat and corn, organizes and is responsible for execution of the production of flour, bread, bakery products, pastries, flour pastes, and crackers, in broad assortments and of superior quality, while taking measures to ensure sound management of raw materials.

(l) It directs and monitors sugar beet production and is responsible for the manufacture of sugar and sugar and oil products; takes measures to effect ongoing improvement in sugar and oil production technologies in order to obtain higher production yields; and ensures elevation of the quality level of sugar products and improvement in the packaging and presentation of these products.

(m) It is responsible for industrial processing and superior utilization of vegetables, potatoes, fruits, and grapes in the form of partly and fully preserved products, ensuring constant diversification of product assortments and improvement in product quality; coordinates and is responsible for the production of juices.

(n) It ensures utilization through wine making of the production of grapes intended for industrial processing, taking measures to ensure application of new and improved technologies resulting in the production of wines of superior quality; coordinates, guides, and issues mandatory provisions relating to the production of alcoholic beverages and fulfillment of delivery obligations to state reserves; is responsible for production of beer in keeping with consumption requirements; is responsible for industrial processing of tobacco and ensures the production of tobacco and cigarettes.

(o) It is responsible for superior utilization of the agricultural food resources available to the national economy, through concentration of prepared food production in specialized units, and for organization of production on industrial principles, by outfitting factories with different capacities which manufacture the products required for commercial feeding, public catering, and collective consumption units.

(p) It coordinates and issues mandatory provisions relating to the production and delivery of wheat flour, corn flour, bread making products, pastry products, and other agroindustrial products made by units subordinate to local authorities; provides specialized technical assistance for such units and monitors the activities of mills operating under the prestation milling system.

(q) It coordinates and supports the development, within the framework of the unified agroindustrial councils, of new industrial facilities for economisound utilization of agricultural raw materials resources; organizes cooperation and association projects between industrial enterprises and agricultural cooperatives and develops departments of enterprises within the sphere of activity of the councils.

(r) It coordinates preparation of the plan for scientific research, technological development, and introduction of technical progress for all sectors of the food industry, and monitors and ensures implementation of this plan; is responsible for institution of the manufacture of new products, in accordance with the programs elaborated, for modernization of existing products, improvement of technologies, mechanization and automation of production processes and labor-intensive processes, and for lowering consumption of raw materials and intermediate products.

(s) It develops and applies new technologies ensuring the production and use of substitutes for critical and imported raw materials and intermediate products.

(t) It cooperates, on the basis of joint priority programs, with research and production units in agriculture to find new breeds or hybrids of livestock and plants, so as to secure for industry raw materials with a high content of useful substances and optimum processing qualities.

(u) It develops projects for standardization of technologies and structures for new facilities in all sectors of the food industry, monitoring the application of these technologies by all producers of foodstuffs, regardless of their subordination.

(v) It coordinates the process of generation and review of technical documentation for all food products, ensuring the inclusion in such documentation of technical requirements relating to quality, composition, rules and methods of quality verification, special packing, marking, and handling regulations, and special rules for protection applicable to the specific climatic and environmental conditions of the countries to which products are to be shipped, along with other parameters, as provided by law.

(w) It monitors compliance with the quality parameter level of technical documents which have been drawn up and rigorous application of such documents following their approval pursuant to law.

(x) It organizes, guides, and coordinates rational utilization and development of the national cold storage network.

B. In Connection with Procurement of Agricultural Crop and Livestock Products

Article 9. The Ministry of the Food Industry and Purchase of Agricultural Products is solely responsible for all activities relating to conclusion of contracts, purchase, and delivery of agricultural crop and livestock products to the state fund and the autonomous supply fund.

Article 10. In its capacity as the entity solely responsible for the activities of purchase, conclusion of contracts, and delivery of agricultural crop and livestock products, the Ministry of the Food Industry and Purchase of Agricultural Products may authorize the Central Union of Commodity Production, Purchasing, and Marketing Cooperatives to conclude contracts and purchase agricultural crop and livestock products, through the units of this union. The Ministry of the Food Industry and Purchase of Agricultural Products may also authorize other ministries and central authorities to conclude contracts for and purchase some agricultural products.

Article 11. The Central Union of Commodity Production, Purchasing, and Marketing Cooperatives and other central authorities are responsible, in accordance with authorization granted, together with the Ministry of the Food Industry and Purchase of Agricultural Products, for completion of tasks connected with contract procurement and delivery of agricultural products to the state fund.

Units which conclude contracts for and purchase agricultural products in accordance with an authorization received will conclude economic delivery contracts with customer units for the amounts provided in the plan.

SECTION 2

Functions in the Area of Formation, Preservation, and Utilization of the State Grain and Industrial Crop Fund

A. In Connection with Formation of the State Grain and Industrial Crop Fund

Article 12. The Ministry of the Food Industry and Purchase of Agricultural Products is responsible for formation of the state fund of cereals, bean crops, and oil-bearing seeds, for which purpose it performs the following.

(a) It organizes and ensures the conclusion of contracts with socialist agricultural units and other producers for delivery of grain and industrial crops to the state fund;

(b) it monitors the material basis of contracts for delivery to the state fund, location and cultivation of crops in the areas planned, procurement and use of varietal and hybrid seeds possessing superior biological properties, and execution of agricultural operations pursuant to law (preparation of the soil, sowing during the optimum period, compliance with plant density regulations, application of natural and chemical fertilizers in keeping with the program, control of diseases, pests, and weeds, and crop maintenance.

(c) It cooperates with the Ministry of Agriculture in evaluation of production of grains, bean crops, and oil-bearing seeds and in drawing up draft balance sheets for these products, to ensure complete formation of the state fund.

(d) It cooperates with the Ministry of Agriculture in organizing the harvesting of grains, bean crops, and oil-bearing seeds and takes steps to ensure that priority will be given to transportation and delivery to reception bases of proucts intended for the state fund.

(e) It ensures receipt of the full amount of grains, bean crops, and oil-bearing seeds delivered to the state fund under contract and by spot purchase, the amounts due the agricultural mechanization stations as payment in kind for work done for agricultural production cooperatives and other producers, and the fees due for milling services.

B. In Connection with Storage and Preservation of Grain and Industrial Crops

Article 13. The Ministry of the Food Industry and Purchase of Agricultural Products is responsible for reception, storage, and preservation of grain, bean crops, and oil-bearing seeds, for which purpose it performs the following.

(a) It effects suitable organization of reception bases and storage areas, making certain that the agricultural products received meet the requirements of law from the viewpoints of quantity and quality.

(b) It ensures reception, storage, conditioning, and preservation of agricultural products.

(c) It superintends performance of tasks connected with purchase of grain, bean crops, and oil-bearing seed from private citizens by cooperative units for production, purchase, and marketing of commodities and monitors the storage and preservation of products by these units.

(d) It monitors and is responsible for the condition of stored products from the viewpoints of quality and sanitation and takes measures to prevent any loss or deterioration.

C. In Connection with Utilization of Grain and Industrial Crops

Article 14. The Ministry of the Food Industry and Purchase of Agricultural Products is responsible for utilization of grain, bean crops, and oil-bearing seeds, for which purpose it performs the following.

(a) It ensures delivery of products from the state fund and verifies their utilization for the purposes established by the plan; proposes measures for reducing consumption and for conserving agricultural products.

(b) It ensures delivery of agricultural products for export, at the times and on the terms established by foreign contracts.

(c) It monitors and takes measures to ensure rigorous compliance with the provisions of law governing transportation and marketing of grain.

(d) It monitors use of products in agricultural production units for the purposes intended, as provided in the balance sheets, and procures undeclared surpluses for the state fund.

(e) It organizes and is responsible for maintenance of records on the entire amount of grain, bean crops, and oil-bearing seeds in the state fund and takes measures to make certain that this fund remains intact.

SECTION 3

Functions Connected with Formation and Preservation of State Agricultural Food Product Reserves

Article 15. The Ministry of the Food Industry and Purchase of Agricultural Products is responsible for formation and preservation of the state reserves of agricultural food products, and for this purpose performs the following.

(a) It ensures accumulation in state reserves of the agricultural food products necessary for efficient and timely satisfaction of needs of the national economy.

(b) It draws up proposals regarding the classified list, levels, minimum stocks, and annual and long-term plans for establishment of state reserves of agricultural food products.

(c) It plans and coordinates the activities of local distribution, warehousing, preservation, and refreshing of state agricultural food product reserves.

(d) It reviews the proposals of ministries and other central state administrative authorities regarding withdrawal of amounts of agricultural food products from state reserve stocks, either definitively or in the form of borrowing.

(e) It ensures the integrity and preservation of the quality characteristics of state agricultural food product reserves, establishing storage periods and taking measures to ensure refreshing of stocks.

(f) It issues mandatory standards regarding state reserves of agricultural food products warehoused both by units subordinate to it and by units subordinate to other ministries and central state administrative authorities.

(g) It proposes the construction of warehousing facilities in keeping with the rate of growth of stocks of state agricultural food product reserves and rational use of existing storage facilities.

(h) It cooperates with appropriate research units to establish conditions for protracted storage and preservation of state agricultural food product reserves.

(i) It draws up a revenue and expenditure budget for the purpose of financing, formation, and administration of state reserves and execution of investment projects.

SECTION 4

Other Functions

Article 16. The Ministry of the Food Industry and Purchase of Agricultural Products also performs the following functions.

(a) It ensures diversification of production and ongoing improvement in the quality characteristics of products with the aim of satisfying the needs of the national economy and increasing their ability to compete on the international market.

(b) It is responsible for elaboration and application of consumption standards for raw materials, intermediate products, and fuels, and takes measures to ensure ongoing reduction of material, energy, and labor consumption; ensures reclamation and utilization of reusable material and energy resources.

(c) It organizes the conduct of studies on the requirements of subordinate units for raw materials, intermediate products, and equipment; ensures balancing of the budgets for raw materials, intermediate products, semimanufactures, and finished products under its jurisdiction; draws up materials budgets for products for which it acts as coordinating agency.

(d) It is responsible for achievement of planned production and for reaching the other targets assigned to it in the unified national plan of socioeconomic development and the state budget, as well as in special programs, periodically informing the Council of Ministers of the progress made.

(e) It guides and coordinates activities connected with organization of production and labor in subordinate units; organizes activities connected with preparation, application, and monitoring of labor standards and norms for all categories of personnel in its sphere of activity; promotes introduction of modern methods and technologies in the organization of production and management of economic units.

(f) It is responsible for development of foreign trade and international economic cooperation activities in its sphere of activity, for which purpose it performs the following.

-- It draws up an export plan; formulates proposals regarding the long-term proportions, structure, and orientation of trade relations; is responsible for completion of the export tasks assigned to it and of international cooperation tasks in its sphere of activity.

-- It organizes and coordinates the activities of economic, technical, and scientific collaboration and cooperation with other ministries and central authorities in Romania and with foreign partners in its sphere of activity.

-- It ensures and is responsible for the application of international conventions and agreements relating to the activities of the ministry; superintends and ensures fulfillment of the obligations deriving therefrom.

(g) It approves order memoranda for new and modernized products and technologies under its jurisdiction, pursuant to law.

(h) It establishes circulating capital requirements for subordinate units, as provided by law.

(i) It analyzes the periodic balance sheets and reports of subordinate units and draws balance sheets and reports relating to the activities of the ministry as a whole.

(j) It draws up and executes, pursuant to law, the revenue and expenditure budget for the central administration of the ministry and subordinate budgetary units.

(k) It performs, pursuant to law, functions relating to prices and tariffs.

(l) It is responsible for application of the party and state policy in personnel and wage matters, for which purpose it performs the following.

-- It establishes uniform criteria for selection, training, advanced training, and promotion of personnel in its sector and subsector of activity and supervises the application of these criteria.

-- It establishes long-term personnel requirements and takes measures for the training of such personnel, pursuant to law.

-- It hires personnel for its own administrative apparatus; appoints the management personnel of the central agencies, comparable units, and other directly subordinate units, pursuant to law.

-- It organizes and ensures improvement in the training of management personnel and specialists.

-- It is responsible for the functions assigned to it in connection with integration of education with scientific research and production, and for coordination of the activities of units with twofold subordination in the area of preparation and implementation of annual research, development, and microproduction plans.

-- It participates in formulation of proposals relating to improvement in elements of the wage system, organizing the preparation of studies for this purpose.

-- It ensures uniform application of the the elements of the wage system on the basis of the flat rate principle, for the sector and subsectors for which it acts as coordinating agency.

-- It establishes, pursuant to law, labor safety measures and ensures the best possible working conditions for prevention of work-related accidents and vocational diseases in units subordinate to it.

-- It establishes overall measures for ongoing improvement in the working and living conditions of personnel.

(m) It is responsible for performance of other functions established pursuant to law.

Article 17. In the performance of its function as central coordinating authority, the ministry of the Food Industry and Purchase of Agricultural Products ensures the following.

(a) specialization, structural differentiation, and integration of production in all units within the the sector.

(b) cooperation between all units subordinate to it and those of other central and local authorities.

(c) collaboration with plan administrators in drawing up the draft sector plan, with the aim of ensuring balanced sector development.

(d) guidance and monitoring, for the sector as a whole, of rational use of means of production, introduction and extension of new technology, start-up of manufacture of new products and improvement of existing ones, ongoing improvement in product quality, increase in labor productivity, and lowering of costs, in accordance with the provisions of approved special programs.

(e) coordination, guidance, and monitoring of rational use of equipment and all production facilities, as well as fulfillment of the plan for construction, assembly, and repair of such equipment and facilities.

CHAPTER III

Organization and Operation

Article 18. The Ministry of the Food Industry and Purchase of Agricultural Products is managed by its management council, which makes decisions in general matters relating to the activities of the ministry; collective management of the operational activities of the ministry and assurance of implementation of the decisions of the management council are provided by the executive office of this council.

The management council of the ministry and the executive office of this council, which are deliberative bodies, are organized and operate in accordance with Decree No 76/1973 on the management of ministries and other central authorities of state administration on the basis of the collective leadership principle.

Article 19. The minister notifies the management council of the ministry of the principal problems solved during the interval between meetings of the council.

Article 20. The Ministry of the Food Industry and Purchase of Agricultural Products has as directors a minister, two deputy ministers, and two secretaries of state.

The deputy ministers and the secretaries of state are appointed by presidential decree, and their functions are established by the management council of the ministry.

Article 21. The minister represents the ministry in relations with other authorities and organizations in the country and in international relations.

Article 22. There is organized and in operation within the Ministry of the Food Industry and Purchase of Agricultural Products, in accordance with Decree No 78/1973, a technical and economic council which is a working body under the collective management authorities of the ministry.

Article 23. The Ministry of the Food Industry and Purchase of Agricultural Products has the following organizational structure:

(a) The Directorate of Purchase and Industrial Processing of Livestock Products.

(b) The Directorate of Purchase and Industrial Processing of Plant Products.

(c) The Directorate of Planning, Finance, and Prices.

(d) The Technical Directorate for Improvement in Technologies and Introduction of Technical Progress into the Food Industry.

(e) The Investment and Mechanical and Power Engineering Directorate.

(f) The Directorate of Foreign Trade and International Economic Cooperation.

(g) The Directorate of Supply and Transportation.

(h) The Directorate of Organization, Personnel, Education, and Wages.

(i) The State Inspectorate for the Food Industry and Purchase of Agricultural Products.

(j) The General Economic Directorate for Purchase of Agricultural Products.

(k) The Legal-Arbitration Office.

(1) The Administrative Secretariat Department.

The organizational structure, by individual work sections, and the maximum number of personnel in the administrative apparatus of the ministry are as indicated in Annex No 1 and Annex No 2 hereto (these annexes will be forwarded to the institutions concerned).

The functions and standards of operation of the sections specified in the first paragraph are established by the management council of the ministry, as provided by law.

The General Economic Directorate for Purchase of Agricultural Products operates on the principle of autonomous economic and financial management. It has the status of a legal entity and performs the functions assigned by law to central agencies.

Article 24. The Ministry of the Food Industry and Purchase of Agricultural Products has subordinate to it industrial central agencies and units comparable thereto, enterprises, scientific research units, other units, and special lyceums and vocational schools for training specialist personnel.

Article 25. The Ministry of the Food Industry and Purchase of Agricultural Products has directly subordinate to it the units listed in Annex No 3.

Article 26. For the purpose of unified coordination of the activities of industrial processing and purchase of agricultural products, there are organized in the districts and in the City of Bucharest councils for industrial processing and purchase of agricultural products subordinate to the Ministry of the Food Industry and Purchase of Agricultural Products and to the executive committees of the people's councils of the districts and of the City of Bucharest.

CHAPTER IV

Final Provisions

Article 27. Enterprises for contract procurement, purchase, and preservation of agricultural products are also subordinate to the executive committees of the people's councils of the districts and of the City of Bucharest.

Article 28. For the purpose of monitoring creation of the state fund, there is in in each enterprise for contract procurement, purchase, and preservation of agricultural products a state representative section with one or two personnel positions for each unified state and cooperative agroindustrial council.

The duties of a state representative are comparable to the duties of chief inspector first class and second class of the district inspectorates for product quality control as specified in Annex No VI, Chapter IV, Section A2, of Law No 57/1974.

Article 29. The Ministry of the Food Industry and Purchase of Agricultural Products is provided with four passenger automobiles for its own common motor pool.

Article 30. Personnel who are transferred from the Ministry of Agriculture and the Food Industry and from the Department for Contract Procurement, Purchase, and Preservation of Agricultural Products to the Ministry of the Food Industry and Purchase of Agricultural Products are considered to be transferred in the interests of the service.

Article 31. Personnel who are transferred in the interests of the service or are transferred in the same unit to positions at lower pay levels, and personnel who are rendered surplus as a result of application of the present Decree, are entitled to the benefits provided in Article 21 of Decree No

162/1973 on establishment of uniform structural standards for economic units.

Article 32. The provisions of Decree No 367/1980 relating to measures for rational use of personnel in socialist units, the applicability of which was extended by Decree No 451/1984, will not be applied until 31 March 1986 to positions in units to and from which personnel are transferred as a result of the provisions of this decree.

Article 33. Within a period of 30 days from the date of entry of this decree into effect, the State Planning Committee and the Ministry of Finance will submit for approval, on the basis of recommendations by the ministries concerned, changes in the economic and financial plan indicators and in the volume and structure of the state budget, together with the effects resulting from application of this decree.

Article 34. Annexes Nos 1-3 form an integral part of this decree.

Article 35. Decree No 420/192 on establishment, organization, and operation of the Department for Contract Procurement, Purchase, and Preservation of Agricultural Products, and any other laws and regulations conflicting herewith, are hereby rescinded.

FARM PRODUCTS COUNTY COUNCILS SET UP

Bucharest BULETINUL OFICIAL in Romanian Part I No 77, 27 Dec 85 p 8

[Council of State Decree No 401]

[Text] DECREE OF THE COUNCIL OF STATE
on Organization of Councils for Industrial Processing and Purchase of Agricultural Products in Districts and the City of Bucharest

The Council of State of the Socialist Republic of Romania hereby decrees the following.

Article 1. For the sake of uniform coordination of the activities of industrial processing and purchase of agricultural products, there are hereby established in the districts and in the City of Bucharest councils for industrial processing and purchase of agricultural products, which are local specialized bodies subordinate to the executive committees of the district people's councils and the people's council of the City of Bucharest and to the Ministry of the Food Industry and Purchase of Agricultural Products.

Article 2. The councils for industrial processing and purchase of agricultural products perform the following functions.

(a) They are responsible for completion of plan assignments by agricultural crop and livestock industrial processing units and for implementation of autonomous supply programs at the level of each district, andd for taking measures to ensure satisfaction of the needs of the local economy and the consumption requirements of the public.

(b) They take measures and are responsible for development of production in food industry units and in other units engaged in industrial processing and treatment of agricultural products and take measures for diversification and improvement in the quality of these products.

(c) They are responsible for superior utilization of agricultural raw materials, for rational and full use of manpower and production facilities, and for introduction of advanced methods of organization of production and labor, with the aim of constantly increasing labor productivity and of reducing material and energy consumption and of cost per unit product.

(d) They supervise and monitor rigorous compliance with the production technologies and formulas elaborated pursuant to law, and take measures to strengthen responsibility, order, and discipline in administration of material and monetary resources in each unit.

(e) They support development, within the framework of the unified agroindustrial councils, of industrial capacities for economically efficient utilization of agricultural raw materials resources; organize cooperation and association projects between industrial enterprises and agricultural cooperatives and develop departments of enterprises in the sphere of activity of the councils.

(f) They monitor livestock slaughter conditions and are responsible for compliance with the provisions of law governing the slaughter weight and the number of animals scheduled for slaughter.

(g) They organize and ensure conclusion of contracts for and delivery of crop and livestock agricultural products to the state fund, at the level of the plan targets; take measures to provide guidance and support, pursuant to law, of socialist agricultural units and other agricultural producers in achieving the production provided by contract, and also to ensure coordination of the activities of industrial processing units with those of agricultural units supplying raw materials.

(h) They are responsible for full execution of export assignments, from the viewpoint of assortment structure and the quality conditions required on the foreign market, by agricultural product processing units within the area under the jurisdiction of the councils.

(i) They prepare studies and programs relating to the proportions, levels, rates, and ways and means of future development of production in agricultural product processing units; ensure elaboration of local plan proposals for the food industry.

Article 3. The councils for industrial processing and purchase of agricultural products cooperate with the general directorates for agriculture, the district unions of agricultural cooperatives, the unified state and cooperative agroindustrial councils, and other local state and public authorities which perform functions in the sphere of agriculture, the food industry, and purchase of agricultural products, for the purpose of ensuring ongoing increase in agricultural crop and livestock production, deliveries to the state fund and the autonomous supply fund, development and diversification of the production of food industry units, and elevation of the quality level of agroindustrial products.

Article 4. The councils for industrial processing and purchase of agricultural products will be organized at district industrial meat processing enterprises and at such enterprises in the City of Bucharest.

Article 5. The number of personnel positions and the classified list of positions in the administrative apparatus of the councils for industrial processing and purchase of food products are indicated in the annex hereto, which forms an integral part of this decree. (The annex will be forwarded to the institutions concerned.)

SCIENCE AND TECHNOLOGY **ROMANIA**

ROLE OF SCIENTIFIC RESEARCH IN IMPLEMENTING ENERGY PROGRAM

Bucharest ERA SOCIALISTA in Romanian No 24, 25 Dec 85 pp 5-8

[Article by Eng Lucia Rosca, general director of the Central Institute for Energy Research, and Dr Eng Mario Duma]

[Text] Nicolae Ceausescu said, "We must continue to concentrate on the energy problem and work to secure the regularity of activity from the first year, but with minimal energy inputs and consistent application of the measures adopted for that purpose."

Intensive development of the national energy base is a major component of socialist industrialization and of the entire task of building the new order. The party and its general secretary Nicolae Ceausescu consider it the role of energy engineering to support the rapid growth of industrial production, development of transportation and telecommunications, technical modernization and intensification of agriculture, and implementation of the investment and construction program, all accompanied by steady growth of labor productivity and economic effectiveness through constant improvement of the energy equipment of labor in connection with mechanization and automation of the industrial processes.

In the years since the Ninth Party Congress Romania has made increasingly intensive use of its energy resources. The steady progress of Romanian energy engineering has been achieved with the support of the other economic sectors and of society as a whole, which have provided the equipment, technologies, materials, constructions, transport means and manpower essential to that sector, and with the growing contribution of Romanian planning and development to the design and construction of energy capacities and to the greatest efficiency of the energy processes. Procurement of energy resources is in the center of the RCP's and its general secretary's attention, and it is and has been closely correlated with a policy of their efficient exploitation and prudent, rational use of energy in the processes consuming it.

On the basis of his far-sighted interpretation of the requirements for the socialist economy's rapid growth and Romanian society's all-around progress and according to a penetrating analysis of the phenomena and the current and long-range trends, Nicolae Ceausescu outlined and determined the main directions of the development of Romanian energy engineering, in the light of which the specific aims and measures were determined that are provided in the Program-Directive for Energy Research and Development approved by the 12th RCP Congress, in the programs adopted by the National Party Conference of 1982, in the Directives of the 13th Party Congress, and in the Program for Technical and Qualitative Improvement of Products, Reduced Consumption of Raw Materials, Fuels and Energy, and Better Use of Raw Materials and Materials.

The strategy of accentuating the qualitative and intensive character of the economy and the goals set by the 13th Party Congress for the 1986-1990 Five-Year Plan and up to the year 2000 in the long range inherently require the continued steady progress of energy engineering. In his address to the Congress on Science and Education the party general secretary spoke of the tasks of scientific and technical research in the present stage, pointing out that "Special emphasis will be placed on implementing the energy program. To this end scientific research must play a major role in the improvement and efficiency of the national energy system, in order to increase productivity and cut the losses in transportation of energy. Unremitting efforts must be made to put the nuclear-electric power plants and the various energy sources into production and the search for new energy sources of great promise must be intensified."

The Program for Scientific Research and Technological Development for the 1986-1990 Period, ratified by the Congress on Science and Technology, assigns all workers in the national energy system tasks of vital importance to procurement of the energy base and its most rational use. The priorities for the best implementation of the national energy program are increased reserves and output of primary energy resources; efficient operation of electric power plants and especially the coal-based ones; activation of the nuclear-electric power plants and the coal-based or hydroelectric power plants under construction; development of technologies to make use of new energy resources, solar energy, wind power and geothermal energy as well as biogas and biomass; recovery of reusable energy resources, and reduction of energy inputs through application of new and perfected technologies and manufacture of high-quality products that will permit better use of Romania's raw material, material and energy resources. As Nicolae Ceausescu pointed out at the recent Plenum of the National Workers Council, "We must work with the greatest determination for the efficient operation of the electric power plants and for production of coal, petroleum and other energy sources, and we must constantly carry out the provisions of the 1986 plan and the whole five-year plan for development of the energy base, which will provide for proper satisfaction of the energy requirement by 1990 and for Romania's further development as well."

As it says in the Decision of the Congress on Science and Education, "Energy is one of the major problems of the next five-year plan. If the planned objectives are to be accomplished, supply of production and all socioeconomic activity with energy is critically important in the present stage and in the future." Accordingly scientific research in general and energy research in particular have an essential part to play in solving the major current problems and also in sound preparation for future development.

In the five-year plan that is coming to a close the efforts of the Central Institute for Energy Research have been concentrated on increased electric power production based on low-grade fuels and securing the operation of the coal-based power plants, reducing consumption of hydrocarbons, better use of the water power potential, and assimilation of new materials and products to replace or reduce imports. Despite the progress we have made in these directions, our institute's contribution to the efficiency of the national energy system has not been commensurate with its material base and human potential. We must work better and more responsibly together with the other units of the Ministry of Electric Power to secure the output of heat and electric power essential to the economy. It is also our duty to further involve our research and design work, in close interdisciplinary collaboration with the specialists in other sectors, in the efforts to replace the energy-intensive technologies and to promote the most efficient ways of using the energy resources.

Greater Efforts To Make Coal-Based Power Plants Efficient

The most efficient operation of the power plants based on low-grade coal is now the priority aim of Romanian energy engineering. Although construction and activation of nuclear-electric power plants will gradually become vitally important, proper operation of the coal-based power plants will continue to be a major concern.

As a matter of fact coal is the first alternative in Romania and throughout the world as well for conserving petroleum and the natural gases. Therefore when a given total power output is planned any shortfall of coal-based electric power directly affects socioeconomic development as a whole.

The Directives of the 13th Party Congress concerning Romania's socioeconomic development in the 1986-1990 Five-Year Plan and the long-range objectives up to the year 2000 call for an electric power output based on coals and bituminous shales amounting to about 38 billion kilowatt-hours compared with 21.5 billion kilowatt-hours, or a 76 percent increase. In 1990, out of the total power output planned to be 95-97 billion kilowatt-hours 39-40 percent will be based on coal and bituminous shales compared with 30 percent in 1984. These major gains as well as the necessary deliveries of heat are to be secured both by increasing the potentials and operating safety of the coal-based power plants and by building and activating enough new lignite-based heating plants and heat and electric power plants in a number of urban centers. Of course this broad program requires sustained efforts to solve some very complicated and diverse technical problems.

At present continuous operation of the 330 milliwatt heat and power units at the Rovinari and Turceni heat and electric power plants is an effort that concentrates major technical forces on the measures and tasks assigned by the party and state administrations. As a unit that combines all the research and design in the Ministry of Electric Power, the Central Institute for Energy Research is directly responsible for failures in the operation of the two heat and electric power plants and in the supply of electric power needed by the national economy. Our institute has not been sufficiently firm and persevering about rapid testing and subsequent generalization of some of the measures designed for this purpose, with a retarding effect upon modernization of installations in the coal-based heat and electric power power plants.

If we are to contribute more to the efficiency of these power plants, we must work well and responsibly to avoid any delay in performing our tasks and we must collaborate more closely and efficiently with the researchers and designers in the heavy equipment and metallurgical industries, the Ministry of Mines and the Ministry of the Chemical Industry, with builders and fitters and with operators in order to find better procedures and technologies for more efficient and safer operation of the installations. It is primarily a matter of measures for the efficient operation of the coal mills, gas fans, feed pumps and water and steam fittings, assimilating special steels for high-pressure conduits, determining the right procedures for maintaining the rubber conveyor belts, etc.

It is the duty of our researchers and designers to help the miners and heavy-equipment builders to solve the main problems of securing the quality of the coal by making it more homogeneous and its heating power more stable. The technical studies and measures to improve the quality of lignite are very important in this respect. A first pilot installation to enrich lignite has been produced and is in an advanced stage of testing. And jointly with the researchers and designers in the units of the Ministry of the Electrotechnical Industry, we are about to make a radical improvement in the reliabilty of the engines and other electric and electronic equipment and apparatus installed in the electric power plants and networks.

In general, the further operational safety of both the main and auxiliary power installations has a critical part to play. This requires high-quality materials and equipment, perfected technological procedures and systems, and construction, installation, operation and maintenance on a high level of professional competence and civic awareness and sense of responsibility. To that end it is our institute's duty to provide, through its inspection teams, for the most exacting quality control of the materials, equipment and installations for the power capacities. But this activity is unsatisfactory and we should improve the inspections and increase the responsibility of those who perform them.

Development and application of technical measures to lower the specific consumption of fule in the coal-based power plants are further main objectives of the institute's researchers' and designers' efforts. It goes without saying that reductions in specific consumption permit corresponding gains in the electric power output, and scientific research and technological engineering have a broad field here, namely prevention or elimination of the causes of increased specific consumption and of technological consumption properly speaking; analysis and tight control of the inputs and possible deviations from the set standards, using electronic computers for the purpose, and modernizations permitting better combustion of the fuel. The same is true of the studies to reduce and and even eliminate consumption of hydrocarbon additives to sustain the flame in coal-burning boilers. A significant example is provided by the successful studies to modernize some boilers at the Oradea Heat and Electric Power Plant, causing them to operate at their normal discharge without the support of hydrocarbons.

The new coal-based heat and electric power plants are in advanced stages of design or construction. But we must redouble our efforts to determine optimal structures for the technological installations and to make the quality specifications for the equipment to be used, especially for their approval, inspection and activation. A high operating quality of the coal-burning 420 tons per hour steam boilers requires the most immediate solution possible of all technical problems that are still unclear by the joint efforts of the energy engineering researchers and the specialists in heavy equipment construction in order to prevent any delays in activating the new heat and power units. It is also highly important to develop modern methods of managing solid fuel in power plants, to further determine the main energy characteristics of the fuel, and to mechanize and automate unloading and handling of the coals, especially under difficulr climatic conditions. All these affect automation of the energy processes properly speaking, with direct consequences for reduced specific consumption, greater operating safety and better labor productivity.

Complete, Most Efficient Use of All Energy Resources

The program to develop energy production calls for complete use of the national energy potential, and exploitation of the hydropower resources has an important role in this. Naturally hydropower improvements of the national territory began with the capacities with the most favorable natural conditions permitting high technical-economic indicators for investments and operation. As a rule the new hydroelectric power plants are built under increasingly difficult natural conditions the further the hydropower potential is exploited, so that the specific investments tend to increase and the technical-economic indicators tend to deteriorate. Therefore we must provide, through our pertinent institutes and jointly with those that design hydropower equipment, new measures to restrict the effects of those trends in order to accelerate the program to build hydroelectric power plants (especially the small ones) and make it cheaper.

Cutting costs through new designs and innovations (of course with no losses in quality, safety, performance or economically effective operation) is an urgent task of scientific research and design applying to all kinds of energy investment projects. Decreasing the investments by means of new technical and building methods will lead to faster construction of more energy capacities with the same financial and material resources, thus meeting the energy requirement sooner for further intensive development of the national economy. It is also a priority requirement to reduce the energy consumed in building the energy constructions themselves (both that incorporated in the construction materials and that at the construction site) by using new building and technological procedures.

Our institute also has important tasks in connection with punctual and optimal implementation of the construction program for nuclear-electric power plants. The energy engineering researchers and designers are concentrating on developing technological and structural measures for the installations in these plants and especially for their traditional, nonnuclear components (boilers, turbines, generators, auxiliary equipment, hydraulic circuits, internal services etc.) In fact even the design and construction of the traditional components of the nuclear power plants require measures quite different from those used in the thermoelectric power plants as well as materials meeting particular quality specifications and equipment and installations with high operating parameters. Research efforts are also being made to perfect the cooling systems of the nuclear-electric power plants and to recover the residual heat as well, since the nuclear plants require far more cooling water than the traditional ones do.

In order to permit future development of the applications of nuclear energy, the researchers and designers will now prepare the plans and technological measures for the use of nuclear reactors in heat supply installations, both by designing heating and nuclear electric power plants, permitting better use of the nuclear fuel, and by creating thermonuclear power plants capable of supplying medium-size urban localities with heat. Studies must also be developed to start new and more advanced generations of reactors including those with rapid neutrons.

In regard to the technologies for exploiting the new and renewable energy sources (solar, wind-power, geothermal, biogas, biomass etc.), in addition to the novelty and diversity of the particular technical measures the close association should be pointed out that we must make between the technologies for receiving and converting the energy and those for effective use of the obtained energy in local installations. In this field too the chief research effort will be to develop technologies, materials and building methods that will permit greater productivity and economic effectiveness in exploitation of renewable energy sources, especially by standardizing and industrializing the production of the components and subassemblies.

Contribution of Scientific Research to Energy Restructuring

Pursuant to the party policies, a process of twofold energy restructuring is being promoted in Romania, namely replacement of petroleum and natural gases by low-grade coal, hydraulic energy, nuclear energy and new sources accompanied by a shift from energy-intensive economic development to one based on better conservation and use of energy. Both aspects of this process inherently require scientific research and technological development because it cannot succeed with the well-know, routine technical procedures but only with the latest advances of contemporary science and technology. As Nicolae Ceausescu pointed out in his address to the Congress on Science and Education, "Humanity is in a developmental stage wherein science is the strongest force for economic and social progress. Accordingly we must not for a moment forget that socialist and communist construction is possible only on the basis of the latest advances of science and technology and on the basis of human knowledge in general."

In accordance with the policies set by the 13th Party Congress, the 1986-1990 Five-Year Plan will specially emphasize the transition from extensive to intensive development in the economy and in all activities. Intensive development requires the most efficient possible use of energy resources providing for steady economic progress while the growth of energy consumption is limited and the energy we have is conserved. To this end, in addition to accentuated development of the sectors and subsectors with a high degree of processing while limiting development or even minimizing the production of the energy-intensive subsectors and processes, it is an important objective to perfect the technologies and technological installations in all energy-consuming processes, so that specific energy consumption will be reduced by technical progress and especially by perfecting the organization and management of the technological processes and the economic activities.

Achievement of a high quality in production and investments, through planning and execution on a competitive level, is essential to the lowest possible energy inputs. At the same time high-quality planning and execution permit increased production of primary energy resources and electric power through energy investment projects that will reach their planned parameters rapidly and maintain them steadily, delivering the entire planned quantity of energy.

In view of these requirements and the major aims set for the next five-year pla the units of the Central Institute for Energy Research will do intensive work in scientific research and technological engineering. In keeping with the tasks assigned at the meeting of the Political Executive Committee of the RCP Central Committeeon 7 December 1985, we shall give priority to studies for expediting, assimilating and introducing production of technologies and products consuming less materials and energy, limiting all capacities to their planned inputs, and modernizing obsolete installations and equipment, for purposes of complete implementation of the adopted programs. The technological experts and energy engineers in the consumer sectors will also contribute directly to the solution of these problems. As Nicolae Ceausescu said at the Plenum of the RCP Central Committee in November 1985, "More responsible action must be taken in all sectors to apply the new technologies for reducing the energy inputs, which are still very high."

Our institute also has extensive tasks (in conformity with the functions as sole administrator of all energy sources assigned the Ministry of Electric Power by the party and state administrations) in connection with solving the problems of correlation among sectors and for all sectors; determining optimal technological energy connections and channels on the scale of the national economy; solving complex energy problems, wherein the energy supply methods (sometimes with different kinds of carriers) are closely connected with those for using the energy; initiating, preparing and perseveringly promoting measures for general use (applicable to various kinds of processes) for exploiting, conserving and recovering energy, including standardization of the installations and the sizes of the energy equipment and parameters; development of uniform methodologies for regulating energy inputs; uniform analysis of the levels and effectiveness of the use of energy in various sectors and activities in the economy, etc.

In the future the main directions of technical progress in conservation of energy, toward which our research will be directed in correlation with the technological studies in all the consumer sectors, concern application of new technological principles instead of the energy-intensive ones in order to cut the losses considerably in the stage of final use of energy; combining technological flows for maximum use of the energy contained in the primary energy resources, and complete and most efficient use of the material and energy resources by means of technologies that forestall any waste or cause minimum waste. We are going to prepare for this future now through scientific and technical studies, including basic research. As Academician Dr Eng Elena Ceausescu, chairman of the National Council for Science and Education, pointed out in her speech at the conclusion of the proceeding of the Congress on Science and Education, "Along with the gain in energy production the researchers must prepare the most rational standards for energy consumption and help to perfect the installations for recovery and recycling and to replace the energy-intensive technologies so as to ensure in this way a reduction by at least 20 percent in energy and fuel consumption."

Aware of the great importance of the supply and efficient use of energy as an essential requirement for rapid development of the national economy and all society, all workers in scientific research, technological engineering and energy planning are firmly resolved to increase their efforts toward proper operation of the installations for producing, transporting and distributing heat and electric power and toward further improvement of all activity in this important sector of socialist construction in Romania.

PAPER ASSESSES RISE IN CONSUMPTION STATISTICS

Prague RUDE PRAVO in Czech 29 Dec 85 p 5

[Text] An important factor in the rise of standard of living is the volume of consumed products and services. In terms of the consumption of basic foods and caloric intake per consumer, CSSR is reaching the level of the economically most developed countries in the world. According to the statistics of the World Organization for Agriculture and Nutrition, the daily caloric intake of a person living in the CSSR in 1980-1982 was 3508 calories, as opposed to, for example, 3544 in France, 3484 in NSR, 3553 in Netherlands, and 3210 in the United Kingdom. Before the war [WW II], the caloric value of foodstuffs consumed in our country was, in comparison to these countries, 10 to 20 percent lower.

Illustrative of the quantitative and qualitative rise in food consumption in CSSR is the per person meat consumption. Before the War, for example, it was one-third lower than in Austria, one-half in comparison with the United Kingdom. At present, consumption of meat per consumer in the CSSR equals that of a consumer in Austria and other capitalist countries, and is even higher than that of United Kingdom. Less satisfactory is the consumption of vegetables that, in comparison with other countries, remains lower.

Comparison of our households is also favorable in respect to home appliances with other economically developed countries. Practically speaking, all our households have a refrigerator and a washing machine. As for television sets per one thousand of population, the CSSR's level is comparable to that attained in other, economically developed countries. As for personal automobiles, CSSR ranks lower for the time being, but the disparity is diminishing steadily.

There has been also significant progress here in the area of housing. In the year 1984, there were 364 apartments per 1000 of population, which is nearly as mauch as in other European countries with good housing conditions. The CSSR has been prominent, by European and world standards, in the intensity of its housing construction. As to the average floor space of the newly built apartments, CSSR ranks among the leading CEMA countries, not reaching, however, the average size of newly built apartments in some developed capitalist countries. However, nearly all newly built apartments in CSSR are equipped with running water, a bathroom or shower, and a central heating system.

The rise in personal consumption is assured, above all, by the rise in wages. During 1970 through 1984, basic wages in CSSR have risen by more than 70 percent. The increase in personal income in the CSSR is not, as in the case of developed capitalist countries, offset by inflation. During the period of 1970 through 1984, the average rise of consumer prices in the CSSR was 21 percent. By contrast, during the same period consumer prices in Italy rose 553 percent, in the United Kingdom 381 percent, in France 275 percent, and in Austria 128 percent. At the same time the cost of foods in a number of capitalist countries has been rising more rapidly than the average of the price increase.

Part of the standard of living is also growth in culture, education and health care. In these areas, the level attained in CSSR is not only on a par with developed countries of the world, but in a number of areas it is even higher. There exists in the CSSR a network of cultural arrangements of all kinds that are accessible to all working people. Czechoslovak cultural activity is reaching a high, internationally recognized level. Education in Czechoslovakia is accessible to all segments of the population, with all expenditures for education paid for by the government. Similarly, health care is free in Czechoslovakia for all citizens and is assured throughout the entire country. The level of preventive health care is very high in our country. The rise in the number of health care professionals contributes, among other things, to the high level of health care in CSSR. According to the statistics of OSN, there is one physician for every 350 people, which ranks CSSR among the best in the world. In terms of hospital beds per 10,000 of population, CSSR surpasses a number of such developed countries, as for example, Belgium of France.

In socialist countries, as opposed to capitalist countries, the standard of living is not made up of consumption alone, whether material or cultural. Its integral part is the social certainty people have in the working process (the right to work and elimination of unemployment), the the pre-employment and post-employpment years, or at the time when a person of working age cannot, for reasons beyond his/her control, become part of the work process. In Czechoslovakia and other socialist countries the rise or maintenance of standard of living is affected by the use of resources from the public fund. Cost free education, medical care, support of young couples, contribution to certain needs (housing, services) etc. are financed from this fund. Benefits from government funded programs augment earnings in CSSR by about two-fifths.
